CHAMBERS'S JOURNAL

OF

POPULAR

LITERATURE, SCIENCE, AND ART

Fifth Series

ESTABLISHED BY WILLIAM AND ROBERT CHAMBERS, 1832

CONDUCTED BY R. CHAMBERS (SECUNDUS)

No. 210.—VOL. V.

SATURDAY, JANUARY 7, 1888.

PRICE 1½d.

THIS MORTAL COIL.

BY GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER I.—BOHEMIA.

WHOEVER knows Bohemian London, knows the smoking-room of the Cheyne Row Club. No more comfortable or congenial divan exists anywhere between Regent Circus and Hyde Park Corner than that chosen paradise of unrecognised geniuses. The Cheyne Row Club is not large, indeed, but it prides itself upon being extremely select—too select to admit upon its list of members peers, politicians, country gentlemen, or inhabitants of eligible family residences in Mayfair or Belgravia. Two qualifications are understood to be indispensable in candidates for membership: they must be truly great, and they must be unsuccessful. Possession of a commodious suburban villa excludes, *ipso facto*.

The Cheyne Row Club is emphatically the headquarters of the great Bohemian clan; the gathering-place of unhung artists, unread novelists, unpaid poets, and unheeded social and political reformers generally. Hither flock all the choicest spirits of the age during that probationary period when society in its slow and lumbering fashion is spending twenty years in discovering for itself the bare fact of their distinguished existence. Here Maudle displays his latest designs to Postlethwaite's critical and admiring eye; here Postlethwaite pours his honeyed sonnets into Maudle's receptive and sympathetic tympanum. Everybody who is anybody has once been a member of the 'dear old Cheyne Row.' Royal Academicians and Cabinet Ministers and Society Journalists and successful poets still speak with lingering pride and affection of the days when they lunched there, as yet undiscovered, on a single chop and a glass of draught claret by no means of the daintiest. Not that the Club can number any of them now on its existing roll-call: the Cheyne Row is for

prospective celebrity only; accomplished facts transfer themselves at once to a statelier site in Pall Mall near the Duke of York's Column. Rising merit frequents the Tavern, as scoffers profanely term it: risen greatness basks rather on the lordly stuffed couches of Waterloo Place.

No man, it has been acutely observed, remains a Bohemian when he has daughters to marry. The pure and blameless ratepayer avoids Prague. As soon as Smith becomes Chancellor of the Exchequer, as soon as Brown takes silk, as soon as Robinson is elected an Associate, as soon as Tompkins publishes his popular novel, they all incontinently with one accord desert the lesser institution in the Piccadilly byway, and pass on their names, their honours, their hats, and their subscriptions to the dignified repose of the Athenæum. For them, the favourite haunt of judge and bishop: for the young, the active, the struggling, and the incipient, the chop and claret of the less distinguished but more lively caravansera by the Green Park purlieus.

In the smoking-room of this truly great and unsuccessful Bohemian society, at the tag-end of a London season, one warm evening in a hot July, Hugh Massinger, of the Utter Bar, sat lazily by the big bow window, turning over the pages of the last number of the *Charing Cross Review*. That he was truly great, nobody could deny. He was in very fact a divine bard, or, to be more strictly accurate, the author of a pleasing and melodious volume of minor poetry. Even away from the Cheyne Row Club, none but the most remote of country-cousins—say from the wilder parts of Cornwall or the crofter-clad recesses of the Isle of Skye—could have doubted for a moment the patent fact that Hugh Massinger was a distinguished (though unknown) poet of

the modern school, so admirably did he fit his part in life as to features, dress, and general appearance. Indeed, malicious persons were wont at times unkindly to insinuate that Hugh was a poet, not because he found in himself any special aptitude for stringing verses or building the lofty rhyme, but because his face and bearing imperatively compelled him to adopt the thankless profession of bard in self-justification and self-defence. This was ill-natured, and it was also untrue; for Hugh Massinger had lisped in numbers—at least in penny ones—ever since he was able to lisp in print at all. He had taken to poetry almost from his very cradle; and had astonished his father at sixteen by a rhymed version of an ode of Horace, worthy the inspiration of the great Dr Watts himself, and not, perhaps, far below the poetic standard of Mr Martin Farquhar Tupper. At Oxford he had perpetrated a capital Newdigate; and two years after gaining his fellowship at Oriel, he had published anonymously, in parchment covers, *Echoes from Callimachus, and other Poems*, which had fairly succeeded by careful nursing in attaining the dignity of a second edition under his own name. So that Massinger's claim to the sodality of the craft whose workmen are 'born not made' might perhaps be considered as of the genuine order, and not entirely dependent, as cynics averred, upon his long hair, his pensive eyes, his dark-brown cheek, or the careless twist of his necktie and his shirt-collar.

Nevertheless, even in these minor details of the poetical character, it must candidly be confessed that Hugh Massinger outstripped by several points many of the more recognised bards whose popular works are published in regulation green-cloth octavos, and whose hats and cloaks, of unique build, adorn with their presence the vestibule pegs of the Athenæum itself. The undistinguished author of *Echoes from Callimachus* was tall and slight, and a trifle affected-looking. That his face was beautiful, extremely beautiful, even a hostile reviewer in the organ of another clique could hardly venture seriously to deny: those large sad eyes, that long black hair, that exquisitely chiselled and melancholy mouth, would alone have sufficed to attract attention and extort admiration anywhere in the universe, or at the very least in the solar system. Hugh Massinger, in short, was (like Coleridge) a noticeable man. It would have been impossible to pass him by, even in a crowded street, without a hurried glance of observation and pleasure at his singularly graceful and noble face. He looked and moved every inch a poet; delicate, refined, cultivated, expressive, and sicklied o'er with that pale cast of thought which modern æstheticism so cruelly demands as a proof of attachment from her highest votaries. Yet at the same time, in spite of deceptive appearances to the contrary, he was strong in muscular strength: a wiry man, thin, but well knit: one of those fallacious, uncanny, long-limbed creatures who can scale an Alp or tramp a score or so of miles before breakfast, while looking as if a short stroll through the Park would kill them outright with sheer exhaustion. Altogether, a typical poet of the newest model, that dark and handsome æsthetic-

looking man: and as he sat there carelessly, with the paper held before him, in an unstudied attitude of natural grace, many a painter might have done worse than choose the author of *Echoes from Callimachus* for the subject of a pretty Academy pot-boiler.

So Warren Relf, the unknown marine artist, thought to himself, in his armchair opposite, as he raised his eyes by chance from the etchings in the *Portfolio*, and glanced across casually with a hasty look at the undiscovered poet.

'Has the *Charing Cross* reviewed your new volume yet?' he asked politely, his glance meeting Massinger's while he flung down the paper on the table beside him.

The poet rose and stood with his hands behind his back in an easy posture before the empty fireplace. 'I believe it has deigned to assign me half a column of judicious abuse,' he answered, half yawning, with an assumption of profound indifference and contempt for the *Charing Cross Review* and all its ideas or opinions collectively. 'To tell you the truth, the subject's one that doesn't interest me. In the first place, I care very little for my own verses. And in the second place, I don't care at all for reviewers generally, or for the *Charing Cross Snarler* and its kind in particular. I disbelieve altogether in reviews, in fact. Familiarity breeds contempt. To be quite candid, I've written too many of them.'

'If criticism in literature's like criticism in art,' the young painter rejoined, smiling, 'why, with the one usual polite exception of yourself, Massinger, I can't say I think very much of the critics.—But what do you mean, I should like to know, by saying you don't care for your own verses? Surely no man can do anything great, in literature or art—or in shoe-blackening or pig-sticking, if it comes to that—unless he thoroughly believes in his own vocation.'

Massinger laughed a musical laugh. 'In shoe-blackening or pig-sticking,' he said with a delicate curl of his thin lips, 'that's no doubt true; but in verse-making, query? Who on earth at the present day could even pretend to himself to believe in poetry? Time was, I daresay—though I'm by no means sure of it—when the bard, hoary old impostor, was a sort of prophet, and went about the world with a harp in his hand, and a profound conviction in his innocent old heart that when he made "Sapphic" rhyme to "traffic," or produced a triolet on the theme of "Catullus," "lull us," and "cull us," he was really and truly enriching humanity with a noble gift of divine poesy. But who in London, in the nineteenth century, can for a moment affect to believe in the efficacy of poetry? Look at this last new volume of my own, for example!—You won't look at it, of course, I'm well aware, but that's no matter: nobody ever does look at my immortal works, I'm only too profoundly conscious. I cut them myself in a dusty copy at all the libraries, in order to create a delusive impression on the mind of the public that I've had at least a solitary reader. But let that pass.'

Warren Relf looked up at him a little uneasily. 'I don't like to hear you run down poetry like that,' he said, with an evident tinge of disapprobation. 'I'm not a poet myself, of course; but still I'm sure it isn't all a mere matter of rhymes

and refrains, of epithets and prettinesses. What touches our hearts lies deeper than mere expression, I'm certain. It lies in the very core and fibre of the man. There are passages even in your own poems—though you're a great deal too cynical to admit it now—that came straight out of the depths of your own heart, I venture to conjecture—those Lines on a Lock of Hair, for example.—Aha, cynic! there I touched you on the raw.—But if you think so lightly of poetry as a pursuit, as you say, I wonder why you ever came to take to it.

'Take to it, my dear fellow! What an Arcadian idea! As if men nowadays chose their sphere in life deliberately. Why, what on earth makes any of us ever take to anything, I should like to know, in this miserable workaday modern world of ours? Because we're simply pitchforked into it by circumstances. Does the crossing-sweeper sweep crossings, do you suppose, for example, by pure preference for the profession of a sweep? Does the milkman get up at five in the morning because he sees in the purveying of skim-milk to babes and sucklings a useful and important and even necessary industry to the rising generation of this great Metropolis? Does the dustman empty the domestic bin out of disinterested regard for public sanitation? or the engine-driver dash through rain and snow in a drear-nighted December like a Comtist prophet, out of high and noble enthusiasm of humanity?' And he snapped his fingers with an emphatic negative.—'We don't choose our places in life at all, my dear boy,' he went on after a pause: 'we get tumbled into them by pure caprice of circumstances.' If I'd chosen mine, instead of strictly meditating the thankless muse, I'd certainly have adopted the exalted profession of a landed proprietor, with the pleasing duty of receiving my rents (by proxy) once every quarter, and spending them royally with becoming magnificence, in noble ways, like the Greek gentleman one reads about in Aristotle. I always admired that amiable Greek gentleman: the *megaloprepēs*, I think Aristotle calls him. His berth would suit me down to the ground. He had nothing at all of any sort to do, and he did it most gracefully with princely generosity on a sufficient income.'

'But you *must* write poetry for something or other, Massinger; for if it isn't rude to make the suggestion, you can hardly write it, you know, for a livelihood.'

Massinger's dark face flushed visibly. 'I write for fame,' he answered majestically, with a lordly wave of his long thin hand. 'For glory—for honour—for time—for eternity. Or, to be more precisely definite, if you prefer the phrase, for filthy lucre. In the coarse and crude phraseology of political economists, poetry takes rank nowadays, I humbly conceive, as a long investment. I'm a journalist by trade—a mere journeyman journalist; the gushing penny-a-liner of a futile and demoralised London press. But I have a soul within me above penny-a-lining: I aspire ultimately to a pound a word. I don't mean to live and die in Grub Street. My soul looks forward to immortality, and a footman in livery.'

Relf smiled dubiously, and knocked the ash off his cigar into the Japanese tray that stood by his side. 'Then you look upon poetry merely as an

ultimate means of making money?' he suggested, with a deprecatory look.

'Money! Not money only, my dear fellow, but position, reputation, recognition, honour. Does any man work for anything else? Any man, I mean, but cobblers and enthusiasts?'

'Well, I don't know. I may be an enthusiast myself,' Relf answered slowly; 'but I certainly do work at art to a great extent for art's sake, because I really love and admire and delight in it. Of course I should like to make money too, within reasonable limits—enough to keep myself and my people in a modest sort of way, without the footman or the eligible family residence. Not that I want to be successful, either: from what I've seen of successful men, I incline to believe that success as a rule has a very degenerating effect upon character. Literature, science, and art thrive best in a breezy, bracing air. I never aim at being a successful man myself; and if I go on as I'm doing now, I shall no doubt succeed in not succeeding. But apart from the money and the livelihood altogether, I love my work as an occupation. I like doing it; and I like to see myself growing stronger and freer at it every day.'

'That's all very well for you,' Massinger replied with another expansive wave of his graceful hand. 'You're doing work you care for, as I play lawn-tennis, for a personal amusement. I can sympathise with you there.—Let's quit the subject. It turns me always into a gloomy pessimist.—What are you going to do with yourself this summer?'

'Me? Oh, just the usual thing, I suppose. Going down in my tub to paint sweet mudbanks off the coast of Suffolk.'

'Suffolk to wit! I see the finger of fate in that! Why, that's just where I'm going, too. I mean to take six or eight weeks' holiday, if a poor drudge of a journalist can ever be said to indulge in holidays at all—with books for review, and proofs for correction, and editorial communications for consideration, always weighing like a ton of lead upon his unhappy breast: and I propose to bury myself alive up to the chin in some obscure, out-of-the-way Suffolk village they call Whitestrand.—Have you ever heard of it?'

'Oh, I know it well,' Relf answered with a smile of delightful reminiscence. 'It's grand for mud. I go there painting again and again. You'd call it the funniest little stranded old-world village you ever came across anywhere in England. Nothing could be uglier, quainter, or more perfectly charming. It lies at the mouth of a dear little muddy creek, with a funny old mill for pumping the water off the sunken meadows; and all around, for miles and miles, is one great flat of sedge and seapink, alive with water-birds and intersected with dikes, where the herons fish all day long, poised on one leg in the middle of the stream as still as mice, exactly as if they were sitting to Marks for their portraits.'

'Ah, delightful for a painter, I've no doubt,' Hugh Massinger replied, half yawning to himself, 'especially for a painter to whom mud and herons are bread and butter, and brackish water is Bass and Allsopp; but scarcely, you'll admit, an attractive picture to the inartistic public, among whom

I take the liberty, for this occasion only, humbly to rank myself. I go there, in fact, as a martyr to principle. I live for others. A member of my family—not to put too fine a point upon it, a lady—abides for the present moment at Whitestrand, and believes herself to be seized or possessed by prescriptive right of a lien or claim to a certain fixed aliquot portion of my time and attention. I've never admitted the claim myself (being a legally-minded soul); but just out of the natural sweetness of my disposition, I go down occasionally (without prejudice) to whatever part of England she may chance to be inhabiting, for the sake of not disappointing her foregone expectations, however ill-founded, and be the same more or less.—You observe, I speak with the charming precision of the English statute-book.'

'But how do you mean to get to Whitestrand?' Relf asked suddenly after a short pause. 'It's a difficult place to reach, you know. There's no station nearer than ten miles off, and that a country one, so that when you arrive there, you can get no conveyance to take you over.'

'So my cousin gave me to understand. She was kind enough to provide me with minute instructions for her bookless wilds. I believe I'm to hire a costermonger's cart or something of the sort to convey my portmanteau; and I'm to get across myself by the aid of the natural means of locomotion with which a generous providence or survival of the fittest has been good enough to endow me by hereditary transmission. At least, so my cousin Elsie instructs me.'

'Why not come round with me in the tub?' Relf suggested good-humouredly.

'What? your yacht? Hatherley was telling me you were the proud possessor of a ship.—Are you going round that way any time shortly?'

'Well, she's not exactly what you call a yacht,' Relf replied, with an apologetic tinge in his tone of voice. 'She's only a tub, you know, an open boat almost, with a covered well and just room for three to sleep and feed in. She's a perfect treasure to a marine painter in the mud-and-buoy business. But I won't for a moment pretend to say she's comfortable for a landsman. If you come with me, in fact, you'll have to rough it.'

'I love roughing it.—How long will it take us to cruise round to Whitestrand?'

'Oh, the voyage depends entirely upon the wind and tide. Sailing-boats take their own time. The *Mud-Turtle*—that's what I call her—doesn't hurry. She's lying now off the Pool at the Tower, taking care of herself in the absence of all her regular crew; and Potts, my mate, he's away in the north, intending to meet me next week at Lowestoft, where my mother and sister are stopping in lodgings. We can start on our cruise whenever you like—say, if you choose, to-morrow morning.'

CHAPTER II.—DOWN STREAM.

Tide served next morning at eleven; and punctual to the minute—for, besides being a poet, he prided himself on his qualities as a man of business—Hugh Massinger surrendered himself in due course by previous appointment on board the *Mud-Turtle* at the Pool by the Tower. But his

eyes were heavier and redder than they had seemed last night; and his languid manner showed at once, by a hundred little signs, that he had devoted but small time since Relf left him to what Mr Herbert Spencer periphrastically describes as 'reparative processes.'

The painter, attired for the sea like a common sailor in jersey and trousers and knitted woollen cap, rose up from the deck to greet him hospitably. His whole appearance betokened serious business. It was evident that Warren Relf did not mean to play at yachting.

'You've been making a night of it, I'm afraid, Massinger,' he said, as their eyes met. 'Bad preparation, you know, for a day down the river. We shall have a lippy sea, if this wind holds, when we pass the Nore. You ought to have gone straight to bed when you left the club with me last evening.'

'I know I ought,' the poet responded with affected cheerfulness. 'The path of duty's as plain as a pikestaff; but the things I ought to do I mostly leave undone; and the things I ought not to do, I find, on the contrary, vastly attractive. I may as well make a clean breast of it. I strolled round to Pallavicini's, after you vacated the Row last night, and found them having a turn or two at lansquenet. Now, lansquenet's an amusement I never can resist. The consequence was, in three hours I was pretty well cleaned out of ready cash, and shall have to keep my nose to the grindstone accordingly all through what ought by rights to have been my summer holiday. This conclusively shows the evils of high play, and the moral superiority of the wise man who goes home to bed and is sound asleep when the clock strikes eleven.'

Relf's face fell several tones. 'I wish, Massinger,' he said very gravely, 'you'd make up your mind never to touch those hateful cards again. You'll ruin your health, your mind, and your pocket with them. If you spent the time you spend upon play in writing some really great book now, you'd make in the end ten times as much by it.'

The poet smiled a calm smile of superior wisdom. 'Good boy!' he cried, patting Relf on the back in mock approbation of his moral advice. 'You talk for all the world like a Sunday-school prize-book. Honest industry has its due reward; while pitch-and-toss and wicked improper games land one at last in prison or the workhouse. My dear Relf, how on earth can you, who are a sensible man, believe all that antiquated nursery rubbish? As a matter of fact, is it always the good boys who pull the plums with self-appreciative smile out of the world's pudding? Far from it: quite the other way. I have seen the wicked flourishing in my time like a green bay-tree. Honest industry breaks stones on the road, while successful robbery or successful gambling rolls by at its ease, cigar in mouth, lolling on the cushions of its luxurious carriage. If you stick to honest industry all your life long, you may go on breaking stones contentedly for the whole term of your natural existence. But if you speculate boldly with your week's earnings and land a haul, you may in time set another fellow to break stones for you, and then you become at once a respectable man, a capitalist, and a baronet. All the great fortunes we see

in the world have been piled up in the last resort, if you'll only believe it, by successful gambling.'

'Every man has a right to his own opinion,' Warren Relf answered with a more serious air, as he turned aside to look after the rigging. 'I admit there's a great deal of gambling in business; but anyhow, honest industry's a simple necessary on board the *Mud-Turtle*.—Come aft, here, will you, from your topsy-turvy moral philosophy, and help me out with this sheet and the mainsail.'

Massinger turned to do as he was directed, and to inspect the temporary floating hotel in which he was to make his way contentedly down to the coast of Suffolk. The *Mud-Turtle* was indeed an odd-looking and original a little craft as her owner and skipper had proclaimed her to be. A centre-board yawl, of seventeen tons registered burden, she ranked as a yacht only by courtesy, on the general principle of what the logicians call excluded middle. If she wasn't that, why, then, pray, what in the world was she? The *Mud-Turtle* measured almost as broad across the beam as she reckoned feet in length from stem to stern; and her skipper maintained with profound pride that she couldn't capsize—even if she tried—in the worst storm that ever blew out of an English sky. She drew no more than three feet of water at a pinch; she could go anywhere that a man could wade up to his knees without fear of wetting his tucked-up breeches. This made her a capital boat for a marine artist to go about sketching in; for Relf could lay her alongside a wreck on shallow sands, or run her up a narrow creek after picturesque waterfowl, or approach the riskiest shore to the very edge of the cliffs, without any reference to the state of the tide, or the probable depth of the surrounding channel.

'If she grounds,' the artist said enthusiastically, expatiating on her merits to his new passenger, 'you see it doesn't really matter twopence; for the next high tide'll set her afloat again within six hours. She's a great opportunist: she knows well that all things come in time to him who can wait. The *Mud-Turtle* positively revels in mud; she lies flat on it as on her native heath, and stays patiently without one word of reproach for the moon's attraction to come in its round to her ultimate rescue.'

The yawl's accommodation was opportunist too: though excellent in kind, it was limited in quantity, and by no means unduly luxurious in quality. She was a working-man's yacht, and she meant business. Her deck was calculated on the most utilitarian principles—just big enough for two persons to sketch abreast; her cabin contained three wooden bunks, with their appropriate complement of rugs and blankets: and a small and primitive open stove devoted to the service of the ship's cookery, took up almost all the vacant space in the centre of the well, leaving hardly room for the self-sacrificing volunteer who undertook the functions of purveyor and bottle-washer to turn about in. But the lockers were amply stored with fresh bread, tinned meats, and other simple necessities for a week's cruise. Thus equipped and accoutred, Warren Relf was accustomed to live an outdoor life for weeks together with his one like-minded chum and companion.

As for Hugh Massinger, a confirmed landman, the first few hours' sail down the crowded Thames appeared to him at the outset a perfect phantasmagoria of ever varying perils and assorted terrors. He composed his soul to instant death from the very beginning; not, indeed, that he minded one bit for that: the poet dearly loved danger, as he loved all other forms of sensation and excitement: they were food for the Muse; and the Muse, like Blanche Amory, is apt to exclaim, 'Il me faut des émotions!' But the manifold novel forms of enterprise as the lumbering little yawl made her way clumsily among the great East-Indiamen and big ocean-going steamers, darting boldly now athwart the very bows of a huge Monarch-liner, insinuating herself now with delicate precision between the broadsides of two heavy Rochester barges, and just escaping collision now with some laden collier from Cardiff or Newcastle, were too complicated and too everpressing at the first blush for Massinger fully to take in their meaning at a single glance. Hugh Massinger was at once amused and bewildered by the careless confidence with which his seafaring friend dashed boldly in and out among brigs and schooners, smacks and steamships, on port or starboard tack, in endless confusion, backing the little *Mud-Turtle* to hold her own in the unequal contest against the biggest and swiftest craft that sailed the river. His opinion of Relf rose rapidly many degrees in mental register as he watched him tacking and luffing and scudding and darting with cool unconcern in his toy tub among so many huge and swiftly moving monsters.

'Port your helm!' Relf cried to him hastily once, as they crossed the channel just abreast of Greenwich Hospital. 'Here's another sudden death down upon us round the Reach yonder!' And even as he spoke, a big coal-steamer, with a black diamond painted allusively on her bulky funnel, turning the low point of land that closed their view, bore hastily down upon them from the opposite direction with menacing swiftness. Massinger, doing his best to obey orders, grew bewildered after a time by the glib rapidity of his friend's commands. He was perfectly ready to act as he was bid when once he understood his instructions; but the seafaring mind seems unable to comprehend that landmen do not possess an intuitive knowledge of the strange names bestowed by technical souls upon ropes, booms, gaffs, and mizzen-masts; so that Massinger's attempts to carry out his orders in a prodigious hurry proved productive for the most part rather of blank confusion than of the effect intended by the master skipper. After passing Greenhithe, however, they began to find the channel somewhat clearer, and Relf ceased for a while to skip about the deck like the little hills of the Psalmist, while Massinger felt his life comparatively safe at times for three minutes together, without a single danger menacing him ahead in the immediate future from port or starboard, from bow or stern, from brig or steamer, from grounding or collision.

About two o'clock, after a hot run, they cast anchor awhile out of the main channel, where traders ply their flow of intercourse, and stood by to eat their lunch in peace and quietness under the lee of a projecting point near Gravesend.

'If wind and tide serve like this,' Relf observed philosophically, as he poured out a glassful of beer into a tin mug—the *Mud-Turtle's* appointments were all of the homeliest—'we ought to get down to Whitestrand before an easy breeze with two days' sail, sleeping the nights in the quiet creeks at Leigh and Orfordness.'

'That would exactly suit me,' Massinger answered, draining off the mugful at a gulp after his unusual exertion. 'I wrote a hasty line to my cousin in Suffolk this morning telling her I should probably reach Whitestrand the day after to-morrow, wind and weather permitting.—I approve of your ship, Relf, and of your tinned lobster too. It's fun coming down to the great deep in this unconventional way. The regulation yacht, with sailors and a cook and a floating drawing-room, my soul wouldn't care for. You can get drawing-rooms galore any day in Belgravia; but picnicking like this, with a spice of adventure in it, falls in precisely with my own view of the ends of existence.'

'It's a cousin you're going down to Suffolk to see, then?'

'Well, yes: a cousin—a sort of a cousin: a Girton girl: the newest thing out in women. I call her a cousin for convenience's sake. Not too nearly related, if it comes to that; a surfeit of family's a thing to be avoided. But we're a decadent tribe, the tribe of Massinger; hardly any others of us left alive; when I put on my hat, I cover all that remains of us; and cousinhood's a capital thing in its way to keep up under certain conditions. It enables a man to pay a pretty girl a great deal of respectful attention, without necessarily binding himself down in the end to anything definite in the matrimonial direction.'

'That's rather a cruel way of regarding it, isn't it?'

'Well, my dear boy, what's a man to do in these jammed and crushed and overcrowded days of ours? Nature demands the safety-valve of a harmless flirtation. If one can't afford to marry, the natural affections *will* find an outlet, on a cousin or somebody. But it's quite impossible, as things go nowadays, for a penniless man to dream of taking to wife a penniless woman and living on the sum of their joint properties. According to Cocker, nought and nought make nothing. When a man has no patrimony, he must obviously make it up in matrimony. Only, the great point to avoid is letting the penniless girl meanwhile get too deep a hold upon your personal feelings. The wisest men—like me, for example—are downright fools when it comes to high play or the domestic instincts. Even Achilles had a vulnerable point, you know. So has every wise man. With Achilles, it was the heel; with us, it's the heart. The heart will wreck the profoundest and most deliberate philosopher living. I acknowledge it myself. I ought to wait, of course, till I catch the eminent alderman's richly endowed daughter. Instead of that, I shall doubtless fling myself away like a born fool upon the pretty cousin or some other equally unprofitable investment.'

'Well, I hope you will,' Relf answered, cutting himself a huge chunk of bread with his pocket clasp-knife. 'I'm awfully glad to hear you say so. For your own sake, I hope you'll keep your

word. I hope you won't stifle everything you've got that's best within you for the sake of money and position and success.—Have a bit of this corned beef, will you?—A woman who sells herself for money is bad enough, though it's woman's way—they've all been trained to it for generations. But a man who sells himself for money—who takes himself to market for the highest bidder—who makes capital out of his face and his manners and his conversation—is absolutely contemptible, and nothing short of it.—I could never go on knowing you, if I thought you capable of it. But I don't think you so. I'm sure you do yourself a gross injustice. You're a great deal better than you pretend yourself. If the occasion ever actually arose, you'd follow your better and not your worse nature.—I'll trouble you for the mustard.'

ASSOCIATION.

I WAS walking the other day through one of the leading thoroughfares in London, when the sun suddenly blazed forth, illuminating a gilt decoration over a shop door and rendering it for the moment conspicuous above its surroundings. The glorified object consisted of two gigantic arms, clad in voluminous sleeves, the arms terminating in hands which were clasped in a death-like grip. Above, were the words 'Association of Capital and Labour;' and the sight of the device and legend brought into my mind a meaning altogether different from that which the word Association conveys.

We have all heard of spiritual mediums, people whose souls are attuned to such fine issues that they are able to act as intermediaries between the spirit-world and those mortals who, by reason of their coarser mould, are debarred this ethereal intercourse. Few of us enjoy the somewhat doubtful advantages of this communion, but all are conscious at times of that subtle and mysterious link between the spiritual and material life, which is known as the power of association. It is exercised through the medium of the senses, of which the most fertile in influence are sound, sight, and scent; the weakest of the five in this capacity being touch and taste.

As sound is conveyed to our ears in its highest form through the divine art of music, it follows that in that form it becomes the strongest agent of association. Who cannot recall occasions in his life when some melody, once known and loved, but long forgotten, burst on his ear, carrying his soul back in a lightning flash to the past, and dissolving the palpable and sentient present into a dim unreality! At such moments, the man who has borne 'blasts of adversity and frosts of fate,' only to grow hardened in the process, becomes weak as a child in the presence of a power mightier than himself. He does well to be humble and reverent under its influence, for it may be the Eternal Spirit is speaking to him through the channel of association.

Many and varied are the emotions awakened by music, and there is not a note in the scale of feeling which does not vibrate to its touch. The

following story illustrates one phase of its power. It was told by a man full of years and honours, the revered head of a beautiful English home.

Many years before, the license of unbridled youth had banished him from his native land. Relatives and friends alike had refused further assistance, and at last the prodigal found himself at the antipodes, friendless and unknown. Lacking utterly the moral stamina necessary in such a case, he sank from bad to worse. One day, having wandered for many hours, absorbed in melancholy thought, he found himself in a scene of peculiar wildness. Giant rocks and awful chasms surrounded him, while the unbroken stillness of evening intensified the gloom of the scene. Suddenly the demon of self-slaughter entered the unhappy man; the means were ready to hand. There, at his feet, was a lake, whose dark waters would soon close the record of a wasted life. None would learn his fate, for in that remote spot human foot seldom trod—seldom, but yet sometimes, for at that moment, sweet and clear, rang out a sound which moved the exile as all the thunders of Jove could not have done. It was a traveller, singing as he went a ballad which had been a favourite with the unhappy man in his distant home. What pen could describe the emotions it aroused at such a time! 'It changed,' said the narrator of the incident, 'the very current of my being; it roused in me a passionate yearning to see my home again; and I vowed solemnly that, please God, I would yet be worthy to return to it.'

An equally forcible though by no means so pleasing an example of the power of association through music is afforded by the following anecdote. A lady was present at an entertainment given by a famous amateur Club. Throughout the evening she had been remarkable, even in that brilliant assembly, for her sparkling humour and the brightness of her sallies; but no sooner had the first bars of Haydn's famous *Surprise Symphony* been played, than she was seen to change colour; a ghastly pallor overspread her face, while her eyes were distended as if in the extremity of fear. Greatly alarmed, her friends bore her from the room, and with some difficulty restored her from a prolonged fainting-fit. 'That dreadful music—that dreadful music!' were the first words she spoke; nor was it until long afterwards that the following explanation of her panic was given to an intimate friend.

Many years previous, she was sitting one day in a room with an elder sister, who was taking a music lesson. The piece under practice was the *Surprise Symphony*, and over and over again, with tedious persistence, did the exacting master make his pupil travel through the symphony, until every note of it was indelibly fixed in the mind of the listener. As the piece was in progress for about the twentieth time, a piercing shriek was heard; the door of the music-room was flung open, and a valued servant, who had been a mother to the sisters all their lives, staggered in, the blood flowing from a fearful wound in her side—staggered, and fell to the floor in a death-agony. She had been murdered by a foreign servant whom she had dismissed for theft, and the assassin had sprung on her from a dark recess in the corridor. Though the horror of that scene had necessarily somewhat faded with the lapse of time, it was revived in all its ghastliness for one

of its witnesses when she again heard the *Surprise Symphony*.

To most of us, some homely sound is fraught with power to bring back scenes of the past. I have a special fondness—which I fear is almost peculiar to myself—for the buzzing of a fly, and was delighted one early winter when a fine large pompous fellow made his home in my room, and whenever the air was warmed, would fly about with tuneful buzz. I had only to close my eyes, and, though winter and rough weather raged without, for me the sun again shone, the birds sang, myriads of insects made a concert of sweet sounds, and the indescribable essence of summer returned.

Somewhat less subtle, but still very powerful, is sight as a medium of association. It has chanced to most of us to revisit some scene after long absence, and to be so moved by familiar objects, that our added years fall from us like a weight in their presence, and for a brief span our souls regain the freshness of a time when all things, even belief, were possible. The poet says, 'Ourselves we cannot re-instate,' yet that is precisely what does happen under such an influence, and our souls are 'set to the same key of the remembered harmony.' It was some such 're-instatement' as this that made Claude Melnotte (the hero in the *Lady of Lyons*), returning home, after many changes and vicissitudes, cry with a passionate rush of memory, 'How the old time comes o'er me!'

A comical instance of the power of sight to arouse association occurs to me. I was present with some schoolfellows at a concert. The entertainment was held in a large public room, which was decorated in the oriental fashion, gilt dragons forming a conspicuous item in the *ensemble*. Now, in this same room we had previously attended a great many religious meetings, for in that fashionable seaside resort, the number and class of persons who undertake to expound the Scriptures are remarkable, even in an age of progress. No sooner had we glanced at the familiar surroundings and taken our seats, than the boy next to me fell on his knees in an attitude of devout supplication. 'Get up!' said I, scandalised; 'what on earth are you doing?' He rose, gave a bewildered look round, and exclaimed: 'Why, I thought I was at a prayer-meeting!'

Very frequent are the allusions of poets to the power of association through the medium of scent. One amorous bard relates that, having succeeded, after countless struggles, in banishing a fair but too fickle *Dulcinea* from his heart, his whole affection for her revived on coming near a flower she was in the habit of wearing. This was rather hard on the poet, and the best we can hope is that his woes were no stronger than the verses in which he expressed them.

That the power of association is possessed by the lower animals is beyond dispute, and has been frequently proved. A friend of mine has a parrot, a bird of unusual attainments, who is in the habit of accompanying his mistress in her summer excursions. Once, during their sojourn in a small village, the bird's cage was placed in the garden, to the unbounded delight of the villagers, who assembled in the evening and listened to his prattle. Among many rustic expressions which Polly picked up was one which

was his peculiar delight. A woman was in the habit of screaming for her child all over the place in a very shrill voice, rising in crescendo at the last syllable, and 'Han-nee, Han-nee!' rang out in the air at all hours. So exact was the bird's imitation, that the unfortunate child was for ever running to and fro, supposing herself called. A winter in town and indoor pursuits banished this cry from Polly's répertoire, and was apparently forgotten by him. However, strange to say, no sooner did he find himself the following summer once more in a village garden than he screamed out 'Han-nee!' and continued to do so at intervals during his stay. What was this, if not the revival of association through the medium of sight?

A similar instance came under my notice some time since. A friend in the country had a valuable Newfoundland dog, between whom and a neighbouring retriever there was a family feud of long standing. The Newfoundland, whom we will call 'Montague,' accompanied his mistress one day on a visit to the home of his rival, 'Capulet.' Those were the days of goloshes, now happily departed. The lady removed hers and placed them inside the door of the house, before entering the drawing-room. Up started Capulet, who had been lying in ambush, seized a golosh in his mouth, and was about to make off with it, when he was pinioned by Montague. A deadly combat ensued. At length, Montague, the victor, seizing his mistress's goloshes, ran off with them triumphantly through the village, and never stopped until he had deposited them safely inside his own door. After that day, never did he pass the gates of his enemy's domain without going in and bearing away some trophy—if only a stick or a stone—as an emblem of his mastery. Years passed by, during which Montague wandered in many lands. He was an old dog when he returned to his early home, and that of Capulet was inhabited by strangers, who knew him not; nevertheless, the first time he passed by the old scene of combat, he disappeared within the gates, and when next seen, was running up his own garden path with a huge hunting-boot between his teeth!

We all know that when the routine of our daily life has been for some time monotonous in its regularity, the slightest deviation from that order will appear to change the very essence of life, as much as if the entire *mise en scène* had been shifted. This is simply because a link in the chain of association has been broken, and it proves how marvellous is its power to weld together the spiritual and material. Doubtless, the most mysterious and subtle form taken by association is embodied in that indescribable sensation that the scene passing before our eyes is in all its minutiae but a reproduction of something which has happened to us before. That this feeling is of comparatively rare occurrence, I believe; but when it is experienced, so overpowering is it, and none the less so because evanescent, that it produces an absolute sense of awe. Whence it comes, its origin and causes, are among the many things which, though dreamt of in our philosophy, have certainly not been explained by it. Some have thought it traceable to dreams, the memory of which, though long faded, revived on a corresponding combina-

tion of circumstances in waking moments; others consider it a shadowy link to some pre-natal existence, of which 'our birth is but a sleep and a forgetting.'

THE GOLDEN INCUBUS.

A NOVELETTE.

BY GEORGE MANVILLE FENN.

CHAPTER I.—SIR JOHN DRINKWATER IS ECCENTRIC.

'You're an old fool, Burdon, and it's all your fault.'

That's what Sir John said, as he shook his Malacca cane at me; and I suppose it was my fault; but then, how could I see what was going to happen?

It began in 1851. I remember it so well because that was the year of the Great Exhibition, and Sir John treated me to a visit there; and when I'd been and was serving breakfast next morning, he asked me about it, and laughed and asked me if I'd taken much notice of the goldsmiths' work. I said I had, and that it was a great mistake to clean gold plate with anything but rouge.

'Why?' he said.

Because, I told him, if any of the plate-powder happened to be left in the cracks, if it was rouge it gave a good effect; but if it was a white preparation, it looked dirty and bad.

'Then we'll have all the chests open to-morrow, James Burdon,' he said; 'and you shall give the old gold plate a good clean up with rouge, and I'll help you.'

'You, Sir John?'

He nodded. And the very next day, he sent all the other servants to the Exhibition, came down to my pantry, opened the plate-room, and put on an apron just like a servant would, and helped me to clean that gold plate. He got tired by one o'clock, and sat down upon a chair and looked at it all glistening as it was spread out on the dresser and shelves—some bright with polishing, some dull and dead and ancient-looking. Cups and bowls and salvers and round dishes covered with coats of arms; some battered and bent, and some as perfect as on the day it left the goldsmith's hands.

I'd worked hard—as hard as I could, for sneezing, for I was doing that half the time, just as if I had a bad cold. For every cup or dish was kept in a green baize bag that fitted in one of the old ironbound oak chests, and these chests were lined with green baize. And all this being exceedingly old, the moth had got in; and pounds and pounds of pepper had been scattered about the baize, to keep them away.

'I'll have a glass of wine, Burdon,' Sir John says at last; 'and we'll put it all away again. It's very beautiful. That's Cellini work—real,' he says, as he took up a great golden bowl, all hammered and punched and engraved. 'But the whole lot of it is an incubus, for I can't use it, and I don't want to make a show.'

'Take a glass yourself, my man,' he said, as I got him the sherry—a fresh bottle from the outer cellar. 'Ha! at a moderate computation, that old gold plate is worth a hundred thousand pounds; and a hundred thousand pounds at only three per cent. in the funds, Burdon, would be three thousand a year. So you see I lose that income by letting this heap of old gold plate lie locked up in those chests.—Now, what would you do with it, if it were yours?'

'Sell it, Sir John, and put it in houses,' I said sharply.

'Yes, James Burdon; and a sensible thing to do. But you are a servant, and I'm a baronet; though I don't look one, do I?' he said, holding up his red hands and laughing.

'You always look a gentleman, Sir John,' I said; 'and that's what you are.'

'Please God, I try to be,' he said sadly. 'But I don't want the money, James; and these are all old family heirlooms, that I hold in trust for my life, and have to hand over—bound in honour to do so—to my son.—Look!' he said, 'at the arms and crest of the Boileaus on every piece.'

'Boileau, Sir John?'

'Well, Drinkwater, then. We translated the name when we came over to England. There; let's put it all away. It's a regular incubus.'

So it was all packed up again in the chests; for he wouldn't let me finish cleaning it, saying it would take a week; and that it was more for the sake of seeing and going over it than anything that he had had it out. So we locked it all up again in the plate-room. And it took five waters hot as he could bear 'em to wash his hands; and even then there was some rouge left in the cracks, and in the old signet ring with the coat of arms cut in the stone—same as that on the plate.

I don't know how it was; perhaps I was out of sorts, but from that day I got thinking about gold plate and what Sir John said about its worth. I knew what 'incubus' meant, for I went up in the library and looked out the word in the big dictionary; and that plate got to be such an incubus to me that I went up to Sir John one morning and gave him warning.

'But what for?' he said. 'Wages?'

'No, Sir John. You're a good master, and her ladyship was a good mistress before she was took up to heaven.'

'Hush, man, hush!' he says sharply.

'And it'll break my heart nearly not to see young Master Barclay when he comes back from school.'

'Then why do you want to go?'

'Well, Sir John, a good home and good food and good treatment's right enough; but I don't want to be found some morning a-weltering in my gore.'

'Now, look here, James Burdon,' he says, laughing. 'I trust you with the keys of the wine-cellar, and you've been at the sherry.'

'You know better than that, Sir John. No, sir. You said that gold plate was an incubus, and such it is, for it's always a-sitting on me, so as I can't sleep o' nights. It's killing me, that's what it is. Some night I shall be murdered, and all that plate taken away. It ain't safe, and it's cruel to a man to ask him to take charge of it.'

He did not speak for a few minutes.

'What am I to do, then, Burdon?'

'Some people send their plate to the bank, Sir John.'

'Yes,' he says; 'some people do a great many things that I do not intend to do.—There; I shall not take any notice of what you said.'

'But you must, please, Sir John; I couldn't stay like this.'

'Be patient for a few days, and I'll have something done to relieve you.'

I went down-stairs very uneasy, and Sir John went out; and next day, feeling quite poorly, after waking up ten times in the night, thinking I heard people breaking in, as there'd been a deal of burglary in Bloomsbury about that time, I got up quite thankful I was still alive; and directly after breakfast, the wine-merchant's cart came from St James's Street with fifty dozen of sherry, as we really didn't want. Sir John came down and saw to the wine being put in bins; and then he had all the wine brought from the inner cellar into the outer cellar, both being next my pantry, with a door into the passage just at the foot of the kitchen stairs.

'That's a neat job, Burdon,' said Sir John, as we stood in the far cellar all among the sawdust, and the place looking dark and damp, with its roof like the vaults of a church, and stone flag floor, but with every bin empty.

'Going to lay down some more wine here, Sir John?' I said; but he didn't answer, only stood, with a candle in the arched doorway, which was like a passage six feet long, opening from one cellar into the other. Then he went up-stairs, and I locked up the cellar and put the keys in my drawer.

'He always was eccentric, before her ladyship died,' I said to myself; 'and now he's getting worse.'

I saw it again next morning, for Sir John gave orders, sudden-like, for everybody to pack off to the country-house down by Dorking; and of course everybody had to go, cook and house-keeper and all; and just as I was ready to start, I got word to stay.

Sir John went off to his club, and I stayed alone in that old house in Bloomsbury, with the great drops of perspiration dripping off me every time I heard a noise, and feeling sometimes as if I could stand it no longer; but just as it was getting dusk, he came back, and in his short abrupt way, he says: 'Now, Burdon, we'll go to work.'

I'd no idea what he meant till we went down-stairs, when he had the strong-room door opened and the cellar too; and then he made me help him carry the old plate-chests right through my pantry into the far wine-cellar, and range them one after the other along one side.

I wanted to tell him that they would not be so safe there; but I daren't speak, and it was not till what followed that I began to understand; for, as soon as we had gone through the narrow arched passage back to the outer cellar, he laughed, and he says: 'Now, we'll get rid of the incubus, Burdon. Fix your light up there, and I'll help.'

He did help; and together we got a heap of sawdust and hundreds of empty wine-bottles; and these we built up at the end of the arched

entrance between the cellars from floor to ceiling, just as if it had been a wine-bin, till the farther cellar was quite shut off with empty bottles. And then, if he didn't make me move the new sherry that had just come in and treat that the same, building up full bottles in front of the empty ones till the ceiling was reached once more, and the way in to the chests of gold plate shut up with wine-bottles two deep, one stack full, the other empty.

He saw me shake my head, as if I didn't believe in it; and he laughed again in his strange way, and said: 'Wait a bit.'

Next morning, I found he'd given orders, for the men came with a load of bricks and mortar, and they set to work and built up a wall in front of the stacked-up bottles, regularly bricking up the passage, just as if it was a bin of wine that was to be left for so many years to mature; after which the wall was whitewashed over, the men went away, and Sir John clapped me on the shoulder. 'There, Burdon!' he said; 'we've buried the incubus safely. Now you can sleep in peace.'

'Yes, Sir John.'

'I ought by rights to kill you now, and bury you in the sawdust, to make you keep the secret. But I'll let you off, for I don't think *you* will tell.'

CHAPTER II.—WHY EDWARD GUNNING LEFT.

It's curious how things get forgotten by busy people. In a few weeks I left off thinking about the hiding-place of all that golden plate; and after a time I used to go into that first cellar for wine with my half-dozen basket in one hand, my cellar candlestick in the other, and never once think about there being a farther cellar; while, though there was the strong-room in my pantry with quite a thousand pounds-worth of silver in it—perhaps more—I never fancied anybody would come for that.

Master Barclay came, and went back to school, and Sir John grew more strange; and then an old friend of his died and left one little child, Miss Virginia, and Sir John took her and brought her to the old house in Bloomsbury, and she became—bless her sweet face—just like his own.

Then, all at once I found that ten years had slipped by, and it set me thinking about being ten years nearer the end, and that the years were rolling on, and some day another butler would sleep in my pantry, while I was sleeping—well, you know where—cold and still—and that then Sir John would be taking his last sleep too, and Master Barclay be, as it says in the Scriptures, reigning in his stead.

And then it was that all in a flash something seemed to say to me: suppose Sir John has never told his lawyers about that buried gold plate, and left no writing to show where it is. I felt quite startled, and didn't know what to think. As far as I could tell, nobody but Sir John and I knew the secret. Young Master Barclay certainly didn't, or else, when I let him carry the basket for a treat, and went into the cellar to fetch his father's port, he, being a talking, lively, thoughtless boy, would have been sure to say something. His father ought certainly to tell him

some day; but suppose the master was taken bad suddenly with apoplexy and died without being able—what then?

I didn't sleep much that night, for once more that gold plate was being an incubus, and I determined to speak to Sir John as an old family servant should, the very next day.

Next day came, and I daren't; and for days and days the incubus seemed to swell and trouble me, till I felt as if I was haunted. But I couldn't make up my mind what to do, till one night, just before going to bed, and then it came like a flash, and I laughed at myself for not thinking of it before. I didn't waste any time, but getting down my ink-bottle and pens, I took a sheet of paper, and wrote as plainly as I could about how Sir John Drinkwater and his butler James Burdon had hidden all the chests of valuable old gold cups and salvers in the inner wine-cellar, where the entrance was bricked up; and to make all sure, I put down the date as near as I could remember in 1851, and the number of the house, 19 Great Grandon Street, Bloomsbury, because, though it was not likely, Sir John might move, and if that paper was found after I was dead, people might go on a false scent, find nothing, and think I was mad.

I locked that paper up in my old desk, feeling all the while as if I ought to have had it witnessed; but people don't like to put their names to documents unless they know what they're about, and of course I couldn't tell anybody the contents of that.

I felt satisfied as a man should who feels he has done his duty; and perhaps that's what made the time glide away so fast without anything particular happening. Sir John bought the six old houses like ours opposite, and gave twice as much for them as they were worth, because some one was going to build an Institution there, which might very likely prove to be a nuisance.

I don't remember anything else in particular, only that the houses would not let well, because Sir John grew close and refused to spend money in doing them up. But there was the trouble with Edward Gunning, the footman, a clever, good-looking young fellow, who had been apprenticed to a bricklayer and contractor, but took to service instead. He did no good in that; for, in spite of all I could say, he would take more than was good for him, and then Sir John found him out.

Miss Virginia got him forgiven at least twenty times, and Mr Barclay spoke up for him too; but when it came to a smell of fire in the house, and me being woke up by Sir John and Mr Barclay at two in the morning, and we all went and found Edward dead drunk in the servants' hall, where he had been reading in bed, and the clothes all smouldering on the floor, there was a row. Sir John said he didn't mind about himself and me, for we were two old useless people, who had had our day, and smothering was an easy death, while being afterwards burnt to ashes was a good Roman kind of an end; but he wasn't going to have his son's life shortened; and he'd hang any man sooner than harm should happen to his darling, Miss Virginia.

So Edward Gunning had to go; and I breathed more freely, and felt less nervous, though I must

say I thought Sir John's remarks about me anything but kind, seeing how I had served him well, and being only seventy-one, with a good deal of work in me yet.

CHAPTER III.—MR BARCLAY THINKS FOR HIMSELF.

So another ten years had slipped away; and the house opposite, which had been empty for two years, was getting in very bad condition—I mean as to paper and paint.

'Nobody will take it as it is, Sir John,' the agent said to him in my presence.

'Then it can be left alone,' he says, very gruffly.—'Good-morning.'

'Well, Mr Burdon,' said the agent, as I gave him a glass of wine in my pantry, 'it's a good thing he's so well off; but it's poison to my mind to see houses lying empty.' Which no doubt it was, seeing he had five per cent. on the rents of all he let.

Then Mr Barclay spoke to his father, and he had to go out with a flea in his ear; and when, two days later, Miss Virginia said something about the house opposite looking so miserable, and that it was a pity there were no bills up to say it was to let, Sir John flew out at her, and that was the only time I ever heard him speak to her cross.

But he was so sorry for it, that he sent me to the bank with a cheque directly after, and I was to bring back a new fifty-pound note; and I know that was in the letter I had to give Miss Virginia, and orders to have the carriage round, so that she might go shopping.

Now, I'm afraid you'll say that Mr Barclay Drinkwater was right in calling me Polonius, and saying I was as prosy as a college don; but if I don't tell you what brought all the trouble about, how are you to understand what followed? Old men have their own ways; and though I'm not very old, I've got mine, and if I don't tell my story my way, I'm done.

Well, it wasn't a week after Mr Bodkin & Co., the agent, had that glass of wine in the pantry, that he came in all of a bustle, as he always was, just as if he must get everything done before dark, and says he has let the house, if Sir John approves.

Not so easily done as you'd think, for Sir John wasn't, he said, going to have anybody for an opposite neighbour; but the people might come and see him if they liked.

I remember it as well as if it was yesterday. Sir John was in a bad temper with a touch of gout—bin 27—'25 port, being rather an acid wine, but a great favourite of his. Miss Virginia had been crying; and I had heard Mr Barclay make use of a word that ought never to have been used in that house, unless it was by Sir John, who, being master, had a right to do as he liked. The trouble had been about Mr Barclay going away. He'd finished his schooling at college, and was now twenty-seven, and a fine strong handsome fellow, as wanted to be off and see the world; but Sir John told him he couldn't spare him.

'No, Bar,' he says in my presence, for I was bathing his foot—'if you go away—I know you, you dog—you'll be falling in love with some

smooth-faced jade, and then there'll be trouble. You'll stop at home, sir, and eat and drink like a gentleman, and court Virginia like a gentleman; and when she's twenty-one, you'll marry her; and you can both take care of me till I die, and then you can do as you like.'

Then Mr Barclay, looking as much like his father as he could with his face turned red, said what he ought not to have said, and refused to marry Miss Virginia; and he flung out of the room; while Miss Virginia—bless her for an angel—must have known something of the cause of the trouble—I'm afraid, do you know, it was from me, but I forget—and she was in tears, when there was a knock and ring, and a lady's card was sent in for Sir John: 'Miss Adela Mimpriss.'

It was about the house; and I had to show her in—a little, slight, elegantly dressed lady of about three-and-twenty, with big dark eyes, and a great deal of wavy hair.

Sir John sent for Mr Barclay and Miss Virginia, to see if they approved of her; and it was settled that she and her three maiden sisters were to have the opposite house; and when the bell rang for me to show her out, Mr Barclay came and took the job out of my hands.

'I'm very glad,' I heard him say, 'and I hope we shall be the best of neighbours;' and his face was flushed, and he looked very handsome; while, when they shook hands on the door-mat, I could see the bright-eyed thing smiling in his face and looking pleased; and that shaking of the hands took a deal longer than it ought, while she gave him a look that made me think if I'd had a daughter like that, she'd have had bread-and-water for a week.

Then the door was shut, and Mr Barclay stood on the mat, smiling stupid-like, not knowing as I was noticing him; and then he turned sharply round and saw Miss Virginia on the stairs, and his face changed.

'James Burdon,' I said to myself, 'these are girls and boys no longer, but grown-up folk, and there's the beginning of trouble here.'

ODD ACTORS.

ALTHOUGH a good stage-presence, striking face, and polished manners are much to the advantage of all adopting the stage as a profession, there have been many instances in which physical defects have been turned by actors to good account. Beauty, if of the type that a poet would call spiritual, is not for the glare of the footlights. Striking features and expressive eyes are the chief recommendations, and the cunning 'make-up' can hide a multitude of imperfections. In this way, positive ugliness is no great drawback to an actor, unless his features are absolutely distorted, as in the case of the French actor, who looked so hideous, that once in a piece where some one said to him, 'You are changing your face,' a cruel wag in the pit shouted: 'Why, let him do so.'

There are only one or two cases where persons born blind have gone on the stage; but there are numerous instances of actors sticking to their work after being afflicted with blindness. In

1744 there was a remarkable performance at Drury Lane for the benefit of a blind author named Dr Clancy. The playbill intimated that 'it was the first instance of any person labouring under so heavy a deprivation performing on the stage,' and hoped that the 'novelty as well as the unhappiness of the case would engage the favour of a British audience.' The blind man played the part of the blind prophet Teresias in the play of *Œdipus*, and achieved much success. In 1790 and succeeding years of the century, we read that a manager named Briscoe, although totally blind, played in the Midland towns, representing the heroes in tragedies and the lovers in comedies. The famous Mrs Dancer was so near-sighted, that once, in an impassioned scene, having unfortunately dropped a dagger, she was unable to find it. One of the attendants tried to push it towards the actress; but it was no use; and the weapon had to be picked up and handed to her in full sight of the audience, thus entirely spoiling the scene.

Numerous stage-accidents have been caused by defective vision. There was a sad scene once at the Dublin theatre, where a young actress, who had to cross a narrow plank representing a bridge, stepped off on to a piece of gauze, and was dashed down to the well of the stage and killed. The late Herr Staudigl, too, when playing Bertram in the opera of *Robert le Diable*, could not find the 'trap' by which he had to sink into the infernal regions, and always afterwards he had to be carefully led to the spot. One of the finest actors Glasgow has produced was the late J. B. Fitzroy, who struggled for years against failing eyesight, and at last was left in darkness. At a benefit organised for him in 1878, he played Sampson Burr in the *Porter's Knot*; and those who witnessed that memorable performance will not soon forget the emotion experienced as the blind old man tottered on to the stage, friendly hands in the 'wings' pushing on his porter's barrow. Although that was his 'last appearance,' he was induced to make some other appearances, and among other parts played one of the witches in *Macbeth*.

There have been one or two instances of insane persons playing parts, the most remarkable being that of a Mrs Verbruggen towards the close of the last century. She lost her reason owing to a disappointment in love, and had to be placed under restraint. Having escaped one afternoon from her attendants, she wandered back to the theatre, where, oddly enough, the play was *Hamlet*. As Ophelia, she had often gained much applause on these very boards. The unfortunate lady concealed herself till Ophelia's cue came, whereupon she rushed on the stage before the real Ophelia could enter. The stage-manager was filled with astonishment, a feeling which changed to wonder and awe as he contemplated the thrilling rendering of the mad scene. Poor Mrs Verbruggen was not 'playing' the part; she *was* Ophelia. It is recorded that 'Nature having made this final effort, her vital powers failed her.'

Dumb actors can of course only appear in pantomime, and that very imperfectly. There are no notable cases; but several good actors have been quite deaf. Hinton, a Birmingham actor, was so deaf that some one had always to stand

in the wings and let him know by a movement when to speak. There is the notable modern instance of the late J. B. Buckstone. How we used to look forward to the visits of the Haymarket Company—a fine combination originally, for Buckstone,

As every well-bred person should,
Kept the best company he could.

He was latterly 'as deaf as a post;' and it was only by intently watching the lips of the other actors and marking the expression of their faces, that he was able to 'pick up his cue.' The difficulty of acting under these circumstances may be imagined; but there was no real falling-off in 'Buckie's' inimitable humour. Of course, his difficulties were fewer in his own pieces; but he could not always be writing dramas, for—as he remarked once, with mingled drollery and pathos—he got to be so busy writing 'orders,' that he had no time for other literary work. Poor old Buckie! his last years were clouded by darker sorrows than deafness. They ought not to have been so, as the venerable comedian really deserved the compliment paid him in 1876 by Mr Gladstone: 'You are, like me, an old public servant.'

Many mummers have suffered from faulty limbs. The famous Foote had to get his left leg amputated, and afterwards wrote the *Lame Lover*, in which he appeared as Sir Luke Limp, and gave a comical account of his loss: 'I have neither strain, splint, spavin, nor gout; have no fear of corns or kibes, and no dread lest any fool should kick my shins or tread on my toes. A leg forsooth—a mere nothing—a very redundancy.' Unfortunately, we cannot all look on our losses in such a philosophical fashion. Charles Mathews the elder was crippled for life by an accident, and once played the part of a lame harlequin in an extravaganza specially written for him. Numerous stories of cripples are told in connection with minor theatres. We remember once seeing in a penny gaff, as the temple of cheap art is called, a young man acting who was supported by a crutch, and we were told that he was regularly in the company, and played all kinds of parts. We should like to have seen him try his hand, or rather his foot, at Romeo, especially when climbing up the balcony! Gout, that most painful and aristocratic of complaints, is no stranger to the stage. A celebrated actor used to play some of his parts seated during the entire performance with his limbs wrapped in flannel; and a well-known comedian of our own day is sometimes seen, in his funniest scenes, to writhe in agony from the same cause.

Hunchbacks have a very small choice of plays. *Richard III.* and the *Hunchback* have both been played by real hunchbacks; but, as a rule, people whose backs are 'all there' would be preferred. A little padding makes quite an effective hunch. Some years ago, a hunchback named Mr Norton went about playing parts suitable to him. He was rather a clever actor, and made a hit in the pantomime of *Humpty Dumpty*.

Drunken actors are fortunately becoming scarcer every day, although it cannot be said that the cause of temperance has as yet many adherents in 'the profession.' Volumes could be filled with the ludicrous exploits of inebriated mummers;

but perhaps it is best to forget the follies of the past.

Child actors and actresses have long been a recognised institution on the stage, but it is a pity to see them introduced unless when absolutely necessary. Of late years, we have had some remarkable instances of precocity, especially in the Children's Opera Companies, and in the recent production of the sensational piece *Human Nature*. Some of our greatest actresses have been on the stage almost from infancy; but it seems to be true that very few great actors have been on the boards as children. During a performance at Aberdeen, some years ago, we were struck with the many curious ways there are of turning an honest penny. The play was a version of the *Heart of Midlothian*, and the sensation scene was the smashing of the prison gate, after which a crowd rushed in, prominent amongst the people being Dumbiedykes with Effie's child. The management, not content with a 'dummy' baby, hired a 'sonsie' young Scotch-woman to bring her baby to the theatre every night at the hour required. We were much struck with the appearance of this youngster—a fine healthy boy of a few weeks old—sleeping peacefully in his mother's arms till the time came for his performance. There was an involuntary scream of excitement from those behind on one occasion when Dumbiedykes fell over a beam as he ran on, but luckily the baby was unharmed. It cried lustily, and of course the audience laughed—audiences always do seem to laugh at every awkward *contretemps*.

We could speak feelingly of the parts enacted by those unfortunate people whom we call 'supers,' but do not deem it necessary to add another to the many denunciations which have been hurled at their stupid heads. After all, they work pretty hard for their shilling a night, and the lot of many of them is so utterly wretched that it seems a positive cruelty to be hard on them.

There is yet another species of Odd Actors, but not belonging to the human family; we refer to the 'lower animals,' many of which have reached a high degree of perfection in their parts. Dogs have been the most successful, and have often been introduced in romantic and sensational plays. In such pieces, we have seen dogs pull ropes, ring bells, and otherwise distinguish themselves. In a recent production of *Uncle Tom's Cabin*, there was a pack of real bloodhounds introduced, and their savage baying had certainly a stirring effect on the audience. In 'variety' entertainments, many animals perform tricks—even pigs have been shown to possess much intelligence by the well-known clown, Mr Walker—but we wish to talk only of the 'legitimate drama.' The horse is not often introduced on the stage, unless under very close supervision, for he is apt to take fright too easily. There have, however, been some astonishing performances seen in such plays as *Mazeppa*; and some years ago, Mr George Rignold created a sensation in *Henry V.* by the realistic dash with which he brought up the rear in the triumphal procession, mounted on his white charger Crispin. About ten years ago, we remember seeing a sensational piece, the *Brigand's Bride*, in which a handsome gray mule plunged into a river (of

cloth), and saved his master's little girl from a canvas grave. Except for an occasional 'walk-on'—as in the case of the royal camel in the *Sultan of Mocha*—few animals, except dogs and horses, have been used in serious drama. In the magnificent production of *Round the World in Eighty Days*, at the Paris Porte St-Martin, however, the stage in one of the tropical scenes was converted into a vast cage filled with wild animals. And in pantomimes, as every schoolboy knows, all sorts and conditions of beasts and birds have contributed their share to the amusement of the British public.

MY FIRST BEAR.

DID any of my readers ever see a wild bear? Not one of the shivering, half-starved animals to be found in the country menagerie with staring coat and bleary eyes, looking anything but fierce as it crouches in its corner insensible to the 'stirring-up' of the attendant's stick, or pacing aimlessly across its cage and nibbling in the friendliest way the nuts which the fearless schoolboy tenders—but a real, roaring, unchained wild bear. The one is very different from the other. Before I knew what a wild bear really was, I had a great contempt for the tribe, and often dreamed of the slaughter I would work if I could only come across a few good specimens. I got the chance one day when I least expected it. It was in September 1885, in Manitoba, towards the close of the Riel Rebellion. I had been sent from Battleford with a detachment of mounted police to scour the country as far as Stony Lake in search of several half-breeds and Indians who were wanted for complicity in the murders of the white settlers at Frog Lake. It was on the homeward journey that I met my bear. We had left Frog Lake in the gray dawn of the morning, and had ridden steadily along all the hot day, pausing only for an hour by an alkaline marsh-pond to water the horses and eat a meal. The police were riding 'easy,' with unbuttoned jackets, and pipes in their mouths; and the prisoners, wrapped in their gaudy blankets, were huddled together in the wagons, asleep for the most part, quite indifferent to the jolting of their carriages and the blistering heat. I had ridden myself so long, that my horse 'Dragoon,' a magnificent animal of seventeen hands, and a pure Broncho, showed signs of fatigue; and I had eased him for a few miles by tying him to the tail-end of a buckboard into which I jumped for a little rest. My companions were two Indian prisoners, young fellows, and both entertaining and interesting to the last degree.

Pas-qui-ac, the elder, was tall and strong, magnificently built, and accounted the best long-distance runner of his tribe. More than once he offered to run for his liberty against any horse in my little troop, an invitation which I was obliged to decline. Mass-ega-wap, the younger, was a mere lad, fine in limb and feature, and with large, melting, coal-black eyes, which would have been a fortune to any Bel-gravia belle. (Pas-qui-ac was tried for arson on my return to Battleford, but although acquitted by the jury, was held on another charge of horse-stealing, and sent back to Edmonton by the police. Mass-ega-wap was found guilty of manslaughter,

and sentenced to twenty years' imprisonment in the Wood Mountain Penitentiary at Winnipeg, from which he was subsequently discharged, on account of the general amnesty granted by Her Majesty the Queen.)

Shortly before sundown, the sharp eyes of Pas-qui-ac descried a small black object almost on the horizon line, and as we neared it, his excitement knew no bounds, for he declared it to be an antelope. Mass-ega-wap, not long behind his dusky brother in the discovery, was also certain that it was a large head of game; and it was amusing to see the frantic gesticulations and hear the guttural chatter of these native hunters as they grew more and more excited. When we came to within five hundred yards of the place where it lay, apparently asleep, I fancied I could discern an animal, but to my unpractised eyes it seemed no larger than a dog, for this extraordinary discrepancy between the real and the imagined size of objects is well known on the prairie. At any rate, it was now certain that a wild animal of some sort was before me, and so far unheeding of my presence. To seize my Winchester and ram a few shells into my pocket took but a moment, and the next saw me out of the buckboard and into the saddle again. With the reins hanging on his neck, and guiding 'Dragoon' with my knees, I loaded as I rode, and managed to get within three hundred yards of my victim, when, to my surprise, he rose, and standing high on his hind-legs, proclaimed himself to be a bear. The sight of the galloping horse must have disconcerted him somewhat, for he dropped at once on all-fours and turned tail. It was with difficulty I gave him a snap-shot as he ran, for he was far to my right; but I could just hear his scream of defiance as 'Dragoon' threw up his heels and bolted. I had never fired a shot from his back, and had taken it for granted that he would 'stand the racket.'

After a circuitous gallop, during which I bewailed my ill-luck, and wondered if I should get within range again, I managed to pull up in the neighbourhood, indicated by two little shrubs, of where I had fired my shot. I tried in vain to track by blood or footmark the retreating quarry, for the hard sandy soil refused to give a sign, and there was nothing for it but to ride ahead and hope. I had not far to go, for, after a canter up a steepish bit of slope, not two hundred yards away, was my bear, standing on his hind-legs, roaring with fury and full of fight. Then followed a brief but ineffectual fight with my horse. Neither voice nor spur availed to force him another inch nearer the pawing adversary; and fearful of losing the game, but without a thought as to the recklessness of the proceeding, I jumped from his back, and saw him flying away while I advanced alone. It will be forgiven me, I trust, if I acknowledge that during these moments I was excited; I know it was not the correct thing to do, and most hunters are so cool and collected on paper—are they not?

I walked on quickly till I was about a hundred yards from Master Bruin, and determining to make a sure shot, I knelt and aimed at him. He did not look very big, and all my nervousness had disappeared as I pulled the trigger. For a second I was blinded by the smoke; but I heard the thud of the bullet; and before I could rise,

the bear was coming at me, stumbling along with a broken shoulder and screaming with fury. If he had looked insignificant a moment before, he seemed big enough now! How loud his scream was, how fast his gallop, how sharp and white his teeth! Retreat was impossible. I was only fifty yards from him now, and to run meant simply to be overtaken and killed; so I knelt again with a strange calmness I could not understand. I remember that I heard the twitter of a bird near by, and noticed the sky growing red with the sinking sun as I raised my rifle. How near he was! What a long aim I took, straight at his head. As I fired, he stopped an instant, turned right round, and ran away from me! I found afterwards that I had hit him right in the throat. I fancy he must have been delirious, if bears ever arrive at such a stage, and imagined, after he turned and ran, that he was still making for me. I was in no hurry to follow him at too close a distance, and I let him run until I marked him into a thicket of trees half a mile away. Then I followed slowly, tracking him easily step by step by his heavy blood-trail. As I entered the thicket, however, the trail was lost; and I peered about here and there, longing to catch another glimpse of him, when suddenly, just at my feet there rose a mighty roar, that made my heart stand still and my cheeks blanch with fear. Half hidden by the trailing vines, and not to be distinguished from the blackened stumps about me, lay the bear in his death-agony, but possessed of sufficient strength still to make an angry bound, half jump, half stumble, in my direction. Mechanically, I thrust the muzzle of my rifle at his head, fired again straight into his ear, and Bruin fell for the last time—dead! I confess that I was afraid for some minutes to make a close examination of the beast. How often I had dreamed of such a scene—how different from the dream was the reality!

A shot at the other end of the thicket made known to me that help was at hand; for the advent of 'Dragoon' riderless and covered with foam had sent a squad of men to search for me in the wilderness. The bear was dragged to the nearest buckboard, and carried there till camp was pitched for the night. He was a fair-sized beast, in fine condition, and weighed, at a rough guess, about three hundred and fifty pounds.

The delight of Pas-qui-ac and Mass-ega-wap when they saw the carcase knew no bounds. To themselves belonged the honour of the original discovery, and this fact they proclaimed on all sides again and again. And to me, the Pale-face, was not praise also due, for had I not gone forth unaided to fight the bear, and conquered him? That night, when the camp-fires were blazing and the silver stars were twinkling overhead, I was halted as I made my usual visit to the prisoners' tent, and made to listen while old Kee-way-tin sang my praises and christened me Wass-sass-ega-ya (The Red Deer's Horn), in token of my skill and prowess. Pas-qui-ac and Mass-ega-wap volunteered to skin the bear on condition that they should have the entrails for their supper (a favourite Indian dish). This was gladly promised, and the skinning was done with surprising skill and quickness. The carcase was afterwards cleaned and quartered, the sharpening of the knives and

the clank of the butcher's leg-irons making music the while. It was with fear that I sat down to the first bear-steak; but who shall tell of its goodness and worth? Was it because my own hand had slain the bear, or because I was tired and very hungry?—or was it because it was a novel dish? Who can tell? But it was more delicious than the finest Club steak I had ever tasted. I had bear's meat for three days on the homeward march, and enough left to feast the mess with for a day on my return to Battleford. The claws were mounted as watch-charms and given to wondering friends; the teeth made brooches for others; and the skin, rich, soft, and ebony black, adorns my sleigh, keeps me warm in spite of Canadian frost and snow, and sets me always thinking of the autumn evening far away when I bagged my first bear.

SLIGHT CIRCUMSTANCES.

It is stated that when Leopold von Ranke began to collect facts for his History, a singular accident occurred in his native town. A bridge gave way one morning, and some persons were swept away in the current beneath. Von Ranke, who was absent at the time, on his return inquired into the details of the catastrophe. 'I saw the bridge fall,' said one of the neighbours. 'A heavy wain had just passed over it, and weakened it. Two women were on it when it fell, and a soldier on a white horse.'—'I saw it fall,' declared another; 'but the wain had passed over it two hours previous. The foot-passengers were children; and the rider was a civilian on a black horse.'—'Now,' argued Von Ranke, 'if it is impossible to learn the truth about an accident which happened at broad noonday only twenty-four hours ago, how can I declare any fact to be certain which is shrouded in the darkness of ten centuries.' To this trivial incident—which to many persons would have borne no lesson—was due much of his caution and impartiality.

A few moments' consideration will convince any one that some of the most momentous crises in history have hinged upon very slight circumstances. A glass of wine, for instance, changed the history of France for nearly twenty years. Louis-Philippe, king of the French, had a son, the Duke of Orleans, and heir to the throne, who always drank only a certain number of glasses of wine, because even one more made him tipsy. On a memorable morning he forgot to count the number of his glasses, and took one more than usual. When entering his carriage, he stumbled, frightening the horses, and causing them to run. In attempting to leap from the carriage, his head struck the pavement, and he soon died. That glass of wine overthrew the Orleans rule, confiscated their property of twenty million pounds, and sent the whole family into exile.

If Mr Grenville had not carried, in 1765, his memorable resolution as to the expediency of charging stamp duties on the plantations of America, the Western world might still have been under British rule. In connection with this matter, there is another slight, albeit remarkable, circumstance, which may be told in Thackeray's own words. 'It was strange,' says he, 'that, in a savage forest of Pennsylvania, a young Virginian officer should fire a shot, and waken up a war

which was to last for sixty years, which was to cover his own country and pass into Europe, to cost France her American colonies, to sever ours from us, and create the great Western republic; to rage over the Old World when extinguished in the New; and of all the myriads engaged in the vast contest, to leave the prize of the greatest fame with him who struck the first blow.'

If the nose of Cleopatra had been shorter, says Pascal, the condition of the world would have been different. His meaning is, that if Cleopatra had had a nose short to deformity, she would have failed to attract Antony, who would not have been drawn into the conduct which culminated in the loss of the battle of Actium, which loss made way for the close of the Roman Republic in the inauguration of the Roman Empire.

Dyspepsia has been the cause of many momentous crises. A leg of mutton is said to have controlled the tide of Leipsic's battle; and the consequences of the indigestion of a certain duchess are proverbial.

The great failure of the potato crop in Ireland cannot be called a slight circumstance, yet it was comparatively slight compared with the momentous changes which it brought about; for the repeal of the corn-laws was hastened by the potato famine. As Lord Beaconsfield has observed, 'This mysterious but universal sickness of a single root changed the history of the world.'

Many men have been drawn to their destiny by the most trivial occurrences. Fenimore Cooper became a novelist through his wife's challenge. One evening, while reading a novel, he threw it down, saying: 'I believe I could write a better book myself.'—'Let me see you do it,' said his wife with a smile. In a few days he had written several chapters of *Precarion*, which, when finished, he published at his own expense. The novel attracted little attention; but it gave Cooper an inkling of his capacity for story-writing, and the *Spy*, his next novel, appealed so strongly to the patriotic sympathies of his countrymen, that it became a great success. Hawthorne, too, was induced to write the *Scarlet Letter* by a remark of his wife.

If Cowley had not found the *Faery Queen* in his mother's parlour, it is just possible that he would never have been a poet. Giotto, one of the early Florentine painters, might have remained a rude shepherd boy if a sheep drawn by him upon a stone had not attracted the notice of Cimabue. Opie might have perished in obscurity if he had not looked over the shoulder of his companion, Mark Oates, while he was drawing a butterfly. Had his friend and companion escaped the thunderstorm at Erfurt, Luther might have been a lawyer.

To exhaust the list of discoveries which have been made through slight circumstances is beyond our power. A few, however, may be noted. Porcelain was discovered by an alchemist while he was trying to find a mixture of earths that would make durable crucibles. If a watchmaker's apprentice had not held up some spectacle glasses between his thumb and finger, telescope lenses might never have been known; and if the shop of a Dublin tobacconist had not been destroyed by fire, Lundyfoot snuff would certainly not have given joy to thousands of snuff-takers. If a few drops of aquafortis had not dropped upon the

spectacles of a Nuremberg glass-cutter, etching on glass might still have remained unknown. Had not the wife of an English papermaker accidentally let a blue bag fall into a vat of pulp, blue-laid paper, the invention of which brought a fortune to the papermaker, might have still to be invented. Lithography, too, was perfected through suggestions made by accident. These few instances, which are not so well known as many others, and which are not intended to be representative, we have jotted down at random. Doubtless, many of the more important inventions due to trifling circumstances will be familiar to our readers.

A well-known Paris scientist, Dr Delaunay, has made some curious discoveries which show the connection between little and great things. To ascertain the qualities of an applicant cook, he says it is sufficient to give her a plate to clean, a sauce to make, and watch how she moves her hand in either act. If she moves it from left to right, or in the direction of the hands of a watch, you may trust her; if the other way, she is certain to be stupid and incapable. The intelligence of people may also be gauged, the Doctor further says, by asking them to make a circle on paper with a pencil, and noting in which direction the hand is moved. The good students in a mathematical class draw circles from left to right. The inferiority of the softer sex, as well as the male dunces, is shown by their drawing from right to left. Asylum patients do the same. In a word, says the Doctor, centrifugal movements are characteristic of intelligence and higher development; centripetal, are a mark of incomplete evolution. A person, as his faculties are developed, may even come to draw circles in a different way from what he did in his youth.

Sir Walter Scott, when walking along the banks of the Yarrow, saw Mungo Park throwing stones into the water and anxiously watching the bubbles that succeeded. In reply to Scott's inquiry as to the object of his occupation, the great traveller said he was thinking how often he had thus tried to sound the rivers in Africa, by calculating how long a time had elapsed before the bubbles rose to the surface. This was a slight circumstance, but the traveller's safety frequently depended upon it.

Now that electricity is used for so many purposes, the slight pressure of a small button frequently effects wonders. So it is, as has been well observed, with the machinery of human life—a slight circumstance may frequently produce the most momentous results.

PAPER BOTTLES.

An attempt now being made on an extended scale to introduce bottles made of paper into this country merits some passing notice. The paper-bottle industry, which has achieved considerable success in Chicago, and is gradually extending throughout the United States, has not yet obtained any development on this side of the Atlantic. Foremost amongst the advantages accruing from this new adaptation of paper is the fact that the bottles are unbreakable; whilst the cost at which they can be placed on the market is considerably lower than that of articles of the same size in glass, stoneware, or tin. A great saving in weight is moreover effected, a desideratum of no small

moment where cost of carriage of large numbers has to be taken into consideration; whilst the cost of packing is reduced to a minimum, for breakage in transit, which is a constant source of loss with glass bottles, is obviously impossible. Special machinery is employed in the manufacture of paper bottles. A long strip of paper of requisite thickness having been formed into a tube by bending around a circular 'mandrel,' is covered externally with an outer glazed sheet, bearing any printed labels to be employed; the tube is then cut into short lengths, to the ends of which are added tops, bottoms, and necks of paper—or of wood, if special strength is desired—nothing further being necessary beyond pouring in and lining the insides with a composition, which on setting will effectively resist the action of acids, spirits, inks, dyes, &c. The utilisation of paper is constantly receiving new adaptations, a bare enumeration of which would constitute a formidable list; whilst enough has been said to demonstrate that the latest development of this material in the bottle-making industry bids fair to hold a not unimportant part in the varied uses now obtained from paper.

MY SNOW IMAGE.

I.

I RAISED an image when the snow lay white—
An image fair, with eyes that sparkled bright,
And form that shone serenely through the night.

The frost was bitter, and the tempest blew
So keen, it pierced the forest through and through;
Yet still my figure stood, and stronger grew.

At last the breeze blew mild, and sunlight shone,
When lo, I looked!—my image fair was gone—
Dead ashes for its feet, its heart a stone.

O Sorrow, was thy lesson told in vain?
Methought, that if I built from care and pain
An image bright, some glory would remain.

II.

Ere long the year to riper fullness grew:
Glad swallows through the sunny copses flew,
And where the image stood, bright daisies blew.

All gone the icy stillness and the snow;
I wandered through the dewy meads, and lo!
Like thawing streams I felt my lifeblood flow.

O snowy image, did I sigh for thee?
The May-blooms hung in garlands from the tree,
And golden kingcups dappled hill and lea.

No more of ice my handiwork shall rise,
But weaved of sunny light from earth and skies,
And gleanings gathered in by grateful eyes:

No more of cold contentment or despair,
But steadfast Hope, whose breath shall be a prayer,
And Love, whose light shall show that life is fair.

SUNDAY AT SEA.

Ye gentlemen of England who live at home at ease,
Ah! little do ye think upon the dangers of the seas.

So runs the well-known glee; and how true it is that not only the dangers, but the entire life of those who 'occupy their business in great waters,' are utterly unknown and unimagined by the great majority of those who live at home at ease.

Take a lookout over the gleaming waters of the Channel: see that tall ship slowly moving across the horizon, silent, dignified, conscious of her strength; the white water curling brightly off her bow; her snowy canvas swelling before the breeze with tender curves and gentle alternations of light and shade. 'How beautiful!' we say. And we stand and gaze until the ever-increasing distance makes it but a pale shadow on the dim horizon line. It has excited our admiration more, perhaps, than most objects which pass beneath our gaze; for he who can look upon a gallant ship in full sail on a sunny sea without pleasure is indeed but a dull soul. But has it never struck us how utterly beyond our knowledge is the ship itself? It is a sealed book to us; we see its exterior—we cannot scan its page. It is an utterly unknown life; few can say with certainty, as men can, and do, of the habits of those with whose lives they are familiar: 'Ah! now they will be 'doing so-and-so;' for only those who are initiated into the mysteries of the sea can follow the sailor in his daily and nightly round.

But amidst all this blank desert of ignorance there is one green spot: in the vast empty vault of darkness which shadows the lives of our sailor-loved ones from us, there shines one peculiarly bright and lovely star—the star which draws the gaze of those on land and those at sea equally heavenward—the star of the Sabbath. For afloat, as on shore, there rise from the lips of men the same prayers for pardon, help, and peace, couched in the same simple words; the same hymns of praise, with the very tunes which in many

instances we first heard from our mothers' lips; and many a heart flies back over those thousand miles of ocean to join with other hearts, which in their turn are going forth to meet them guided by the spirit of love.

I remember well the first Sunday I spent at sea. Our hearts were still aching from the strain which had broken all the ties which bound us to home; England was hardly yet out of sight; the echo of that saddest of all words, 'Good-bye,' was still ringing in our ears, and the well-known prayers brought back vividly to our minds the surroundings inseparably connected with them in our young lives: the parish church, the familiar faces, the village where our boyhood had been spent, each humble cottage, each shady tree, each barn and hovel. But a Sunday at sea in the service of Her Majesty, though affording us this one great and precious link with our loved ones at home, cannot be said under all circumstances to continue the resemblance. There are conditions under which divine worship is conducted afloat which are utterly without parallel in the house of God ashore. The wind may roar and the squalls may burst savagely upon the high-pitched roof of the church; but the congregation is unaffected by the circumstance, save for sundry fears and anxieties as to the means of getting home dry-shod. But what if the edifice itself were to begin to roll and sway itself about in such bewildering fashion as to make the locality of each individual worshipper a matter of anxious doubt and difficulty? What if the very element on which it stood were to strive its utmost to increase the disorder?

We had two separate and distinct kinds of divine worship on board, specially adapted to the exigencies of the matter. One was known among us as 'Sit-down' church; the other as 'Stand-up' church. When the wind was fair and the sea smooth, when the sky was clear and the sun bright, when the surface of the ocean was reflecting from myriads of dimpling wavelets the brilliant hue and glancing beams of the firmament above, then Sunday at sea showed no very striking contrast to the day of rest ashore.

The services of the church were prefaced by the service of the state known to us as 'divisions,' when a careful and searching inspection of ship and crew was carried on in grave and decorous silence by captain, commander, and senior lieutenant. The blue-jackets and marines, drawn up on the upper deck, stood at ease 'toeing a line' with almost mathematical accuracy, gravely bowing to each other with unmoved faces as the ship rolled slowly upon the gently heaving surface of the sea; while the officers not actually on duty grouped themselves picturesquely, but with no attempt at regularity, under or abaft the bridge, and remained silent spectators of the function, or conversed in whispers apart. The temptation to illicit skylarking was often too great for the weak minds of the midshipmen; and suppressed forms of mild practical jokes were perpetrated on any of their number whose appearance, attitude, or dress seemed to encourage such a proceeding; otherwise, the silence that prevailed was broken only by an occasional order from the officer of the watch on the bridge.

'Divisions' over, the crew would disperse for a short time while the order to 'rig church' was carried out. In a large frigate, this was always done upon the maindeck, the principal gun-carrying deck, that is, of the ship, thoroughly protected from wind and rain by the upper deck above it. Here accommodation was provided for the men, some five hundred in number, by placing capstan bars and planks across inverted 'wash-deck tubs,' affording thus a kind of rough-and-ready form on which to sit. These were placed 'athwartships,' across the breadth of the deck, while chairs were arranged farther aft for the senior and junior officers, who generally sat on opposite sides of the deck. The chaplain, who on board ship is known by a thousand more or less irreverent names—Padre, Sky-pilot, &c.—is supplied with a portable apparatus as nearly akin to the reading-desk of the shore as the wit of a ship's carpenter can devise. This is also 'rigged' in a commanding position between the officers and men.

All being reported ready to the commander, the order is given to 'toll the bell;' and forthwith the sentry begins to thump slowly and monotonously upon the ship's bell, the clapper of which is held in the hand and used as a hammer, instead of the bell itself being swung. The men are marched off to their places, the officers take their seats, the captain comes out of his cabin, the chaplain enters his desk, and the familiar and solemn words of the service fall upon the ear, accompanied in this case by the muffled groaning of the ship as she sways before the pressure of the breeze. The responses are, as a rule, not loudly or distinctly made, but merely muttered; whereas, were all that congregation of men fully imbued with the spirit of prayer, a great and emphatic stream of supplication should ascend from that compact parish

to the throne of Him who rules the raging of the sea. But when the time arrives for Praise, then, provided that the tune is well known and popular, the blue-jackets break into a burst of song, often most harmonious, always admirable from the power and richness of the volume of sound, and in which many may be noted taking, with well-trained accuracy, the tenor and even the alto parts. This is sometimes led by a small harmonium; sometimes, should the ship be large enough to possess one, by the ship's band. Then follows, as on shore, the sermon; but when at last the blessing has been given, and ere the more seriously inclined have risen from their knees, the loud imperative order comes from the lips of the commander, 'Boatswain's mate, pipe down!' the shrill trill of that petty officer's whistle is instantly raised, in obedience to the mandate, and officers and men leave the maindeck, which is speedily cleared of its Sunday paraphernalia.

This, however, was fine-weather worship, when we could all meet in prayer without hindrance. But there came Sundays when the conditions were far otherwise—when the wind was shrieking and whistling with fiendish uproar through spars and rigging; when the waves were roaring and hissing, striking with the force and thud of a steam-hammer against the bows of the labouring ship, which herself added to the din by the indescribable moans and groans and cracks by which she gave expression to her indignation at such unfair treatment. She would writhe and wallow, would plunge and roll, would tremble and stop, and then make a still more furious rush forward, until all thought of divine worship in the usual form was out of the question. These were the days of 'Stand-up' church, and now the elaborate arrangements of the fine-weather function were conspicuously absent. The maindeck ports were closed, to keep out the hissing and angry seas, and the only light came from the hatchways above, many of them closed by gratings. All stood, officers and men alike; and those who had experience of such things kept their eyes on a handy ringbolt or friendly breeching of a gun, anything, in fact, to which they might cling should the motion of the ship become too violent even for well-trained sea-legs. Then the chaplain, no longer trusting himself within the compass of his reading-desk, but clinging with all the strength of one arm to an iron stanchion supporting the deck above, lifted up his feeble voice in opposition to those of the strident elements, which seemed to unite in the effort to smother his solemn tones with their demoniac uproar, lest they should wing their way upwards and attain their goal. No sermon now, no hymns, no litany, just the simple morning prayers, and the men are dismissed to find what comfort they can on the close, musty, dark, wet decks.

But the Sundays really pregnant with disaster were those when it was impossible for the commanding officer to estimate with certainty the

superior advisability of either form of service. It would be bright and sunny, the upper deck dry and warm, the seas perhaps rather high and long, and the ship inclined to roll and wallow as she sped across them; but it was a great thing to have the men inspected on deck and to keep the maindeck ports open for ventilation and for light. 'Divisions' would certainly be upon the upper deck; but now there was a distinctly humorous element imported into the otherwise serious function. The marines from their double line no longer bowed to each other gravely and gently, but uncertainly and with exaggerated emphasis. The ship would roll heavily to starboard, and the 'Joeys' on that side of the vessel, facing 'inboard,' would assume such an acute angle with the deck as to make one think that they were rehearsing a gymnastic drill of more than usual interest; while the opposite line on the port-side were trying to touch the deck with the backs of their heads while standing at attention. But in a moment all this would be reversed; the old ship would give a staggering pitch, inclining all the line aft, and seriously compromising the steadfastness of not a few; and would then roll over to port with such unexpected suddenness that the most accomplished sea-dogs would hang fire for a moment, and the waverers fall helplessly on the deck and roll away to leeward. The efforts of the remainder, who retained their footing, to appear as if they were unaware of and did not enjoy the misfortune of their comrades, would require the pencil of a Caldecott to depict.

Even the inspecting march of the captain, commander, and attendant satellites, usually conducted with great gravity, solemnity, and sternness, had an element of uncertainty imparted to it which seriously impaired its dignity; and the 'fetching away' of one or two of the party to leeward in a direction obviously opposed to their intentions and wishes, and the sprawling lurches of others, are sure to be immensely enjoyed by the junior members of the gunroom mess. I recollect once how our commodore, a man of small stature, but unusual bulk, came up the after hatchway one stormy morning, and had hardly planted one foot upon the slippery deck, when his heel shot away from under him with the roll of the ship, and he sat down with all the weight of his sixteen stone and with terrific suddenness upon the deck, to the great detriment of his comfort and his dignity.

Divisions over, the question had to be settled, 'Stand-up' or 'Sit-down' church? 'Stand-up' was the safer, no doubt; but there were arguments in favour of 'Sit-down' as well. One such Sunday is clearly graven in my memory. We were running some ten or eleven knots almost dead before the wind, with stun'-sails set on both sides; our speed will show that the wind was strong; we were leaping from one long sea to another, and if the good old ship could do nothing else, she could roll. Her gifts in that particular were truly marvellous. She would go over with a long heavy lurch until the water was bubbling up through her lee scupper-holes; while, if you looked through a weather-port, you stared right up into the sky above; and just when everybody had made up his mind that she had reached her limit on that roll, and would go no farther, she

would hang fire for a minute, as if to consider the matter, and then, with a little kick, would go another degree farther, out of pure mischief. That last kick settled everybody. The steward would roll out of his berth, pursued by a clattering crowd of revolting plates and dishes; the cook would shoot out of the 'galley' with the boiling contents of half-a-dozen capsized mess-kettles washing over him; ship's boys and midshipmen would take frightful headers down yawning hatchways with an apparent impossibility of being ever seen again alive; the sixty-eight-pound shot would leap from their racks, and bound in wild excitement across the maindeck, carrying terror and disaster in their track; the sea-chests would start off from their apparently immovable positions on the lower deck, and indulge in a frantic bacchanalian orgie, which usually ended in one or two of them being precipitated into the hold. Nevertheless, on this particular occasion the sun was bright and the weather delicious; and in an evil moment, the order was given to 'rig church' for the more elaborate form of worship.

Our troubles commenced at once, even while the bell was a-tolling and before the service was begun. It had already been noted as an ominous circumstance that the men who were carrying the reading-desk to its proper station fell down in a heap with that structure on the top of them, and loudly broke the third commandment in consequence; but the order had been given, and must be obeyed. Our boys, a goodly row of stalwart lads, were drawn up aft, opposite the wardroom skylight, which was wide open for air and light; they were under the charge of a ship's corporal, and they 'toed a line' with admirable regularity and discipline under that strict petty-officer's eye. But even the eye of a ship's corporal is of no avail against the laws of nature. The old ship prepared for action; she gave one of her long heavy rolls—down, down, down she went; the boys were taken unawares; they started all together on a fatal slide; there was nothing to bring them up until they caught the coaming of the skylight with their toes; their pace increased, and tripping on the treacherous coaming, they went headlong down the open skylight, and fell crashing on the wardroom table below; while at the same moment, a Portuguese midshipman whom we had on board shot, head first, into the big drum, which was hanging up on the opposite side of the deck, and went rattling, booming, and banging away to leeward, with that unmanageable instrument, amidst a shout of smothered laughter from those around. Roundly did the first lieutenant rate the unfortunate corporal for not keeping the boys in order. It was nothing to him that that functionary was hanging on, nails, teeth, and eyelids, to a ringbolt, to save himself from a similar fate. He was put there to keep order, and he must do his duty, even should the skies fall. Gradually, order is restored; the boys are marched off to their places; the men take their seats on the improvised forms; the officers sit down with some misgivings on their respective chairs; and the Padre commits himself to the protection of his reading-desk with a gleam of satisfaction on his face at noticing that it was securely lashed to his friend the stanchion, and service began.

At first, all went well. The men managed to

keep pretty steady, though, if the topmost man of the row slipped, he bore down upon the next man, who leaned heavily upon the next, and so imperilled the entire row. When we stood up, too, a chair would now and again begin to slide down the incline of the deck; but it was arrested at once by the owner. We got through the Psalms and First Lesson without any serious interruption, though the tendency of some of our chairs to skate off without notice made it almost an impossibility to attend, and caused us serious anxiety, the more so as a sea had occasionally 'plopped' up through the ports and made the decks more slippery than ever. We had reached the middle of the Second Lesson, when our chief-engineer suddenly started off on his chair at the top of a terrific roll, at a hand-gallop. He was a very tall man, with unusually long legs, and his only hope of salvation would have been to rise instantly—a difficult matter, when your chair has commenced its career and the angle of the deck is increasing every moment—and, abandoning his seat, to seek security by grasping the nearest fixture. But our gallant chief lost his head. He madly tucked his long legs up on each side of his chair, and, with horror depicted on his countenance, bore straight down upon the wardroom skylight with a velocity far beyond that of a Canadian tobogganer. It seemed that nothing but a miracle could save him from the fate of the boys; but, recognising his danger, he threw himself sideways off his conveyance just as he reached the fatal coaming, and managed to cling to it with such a frenzied grasp as to arrest his own downward progress, while the chair went bounding into the wardroom, and, smashing a swinging lamp, deluged with oil the ship's log, which had been left open on the table, and utterly ruined it.

But the disaster of the chief engineer was, a second or two after, swallowed up and blotted out by the ruinous calamity which involved the whole ship's company in its malignant embrace. The roll which had well-nigh brought him to destruction was indeed terrific, and many a mess-mate had been on the verge of following him down that fatal slide; but the old ship was now on her mettle, and her counter-roll was a masterpiece. Over, over, over she went, till the terrified occupants of the remaining chairs rose hastily and clung with feverish tenacity to guns, tackles, or bolts, and so saved themselves, while their chairs went rattling down the incline without them. But the ship's company were in a far different position. Up went her port side to the very skies; down sank the starboard side till the seas bubbled and seethed through her wide open ports; then she hesitated a moment, the men hanging on to their seats like grim death, feeling well that they were on the brink of a catastrophe; and then she gave her little kick, and lay down a fathom or so farther. That settled the matter; and with one terrific rattling crash, the mass of men, blue-jackets, marines, and boys went swooping away in one indescribable and chaotic ruin, head over heels, into the lee scuppers, followed by wash-deck tubs, capstan bars, planks, round-shot, and every movable thing on board the ship; and as they lay there inextricably mixed, entangled, huddled up, piled three or four deep on top of each other, three great green seas came

roaring in through the weather-ports in tuns of water, and washed them all down just as thoroughly as if they had been overboard. After that, we piped down.

THIS MORTAL COIL.

CHAPTER III.—ARCADIA.

THE village of Whitestrand, on the Suffolk coast—an oasis in a stretch of treeless desert—was, and is, one of the remotest and most primitive spots to be found anywhere on the shores of England. The railways, running inland away to the west, have left it for ages far in the lurch; and even the two or three belated roads that converge upon it from surrounding villages lead nowhere. It is, so to speak, an absolute terminus. The World's End is the whimsical title of the last house at Whitestrand. The little river Char that debouches into the sea just below the church, with its scattered group of thatched cottages, cuts off the hamlet effectually with its broad estuary from the low stretch of reclaimed and sluice-drained pasture-land of wiry grass that rolls away to southward. The very name Whitestrand, as old as the days of the Danish invasion of the East Anglian plain, at once describes the one striking and noteworthy feature of the entire district. It has absolutely no salient point of its own of any sort, except the hard and firm floor of pure white sand that extends for miles and miles on either side of the village.

All Whitestrand—what there was left of it—belonged to Mr Wyville Meysey. His family had bought the manor and estate a hundred years before, when the banking firm of Meysey's in the Strand was in the first heyday of its financial glory. Unhappily for him, his particular ancestor, a collateral member of the great house, had preferred the respectable position of a country gentleman to an active share in the big concern in London. From that day forth, the sea had been steadily eating away the Meysey estate, till very little was left of it now but salt marsh and sandhills and swampy pasture-lands.

It was Tuesday when Hugh Massinger and Warren Relf set sail from the Tower on their voyage in the *Mud-Turtle* down the crowded tidal Thames; on Thursday morning, two pretty girls sat together on the roots of an old gnarled poplar that overhung the exact point where the Char empties itself into the German Ocean. The Whitestrand poplar, indeed, had formed for three centuries a famous landmark to seafaring men who coast round the inlets of the Eastern Counties.

The elder of the two girls who sat together picturesquely on this natural rustic seat was dark and handsome, and so like Hugh Massinger himself in face and feature, that no one would have had much difficulty in recognising her for the second cousin of whom he had spoken, Elsie

Challoner. Her expression was more earnest and serious, to be sure, than the London poet's; her type of beauty was more tender and true; but she had the same large melting pathetic eyes, the same melancholy and chiselled mouth, the same long black wiry hair, and the same innate grace of bearing and manner in every movement as her distinguished relative. The younger girl, her pupil, was fairer and shorter, a pretty and delicate blonde of eighteen, with clear blue eyes and wistful mouth, and a slender but dainty girlish figure. They sat hand in hand on the roots of the tree, half overarched by its hollow funnel, looking out together over the low flat sea, whose fresh breeze blew hard in their faces, with the delicious bracing coolness and airiness peculiar to the shore of the German Ocean. There is no other air in all England to equal that strong air of Suffolk; it seems to blow right through and through one, and to brush away the dust and smoke of town from all one's pores with a single whiff of its clear bright purity.

'How do you think your cousin'll come, Elsie?' the younger girl asked, twisting her big straw hat by its strings carelessly in her hands. 'I expect he'll drive over in a carriage from Daw's from the Almundham Station.'

'I'm sure I don't know, dear,' the elder and darker answered with a smile.—'But how awfully interested you seem to be, Winifred, in this celebrated cousin of mine! What a thing it is for a man to be a poet! You've talked of nothing else the whole morning.'

Winifred laughed. 'Cousins are so very rare in this part of the country, you see,' she said apologetically. 'We don't get sight of a cousin, you know—or, for the matter of that, of any other male human being, erect upon two legs, and with a beard on his face—twice in a twelve-month. A live young man in a tourist suit is quite a rarity, I declare, nowadays.—And then a poet too! I never in my life set eyes yet upon a genuine all-wool unadulterated poet.—And you say he's handsome, extremely handsome!'

'Winifred! Winifred! you naughty bad girl!' Elsie laughed out, half in jest and half in earnest, 'moderate your transports. You've got no sense of propriety in you, I do believe—and no respect for your instructress's dignity either. I oughtn't to let you talk on like that.—But as it's only Hugh, after all, I suppose it really doesn't matter. I look upon Hugh, Winnie, like my own brother.'

'What a jolly name—Hugh!' Winifred cried, enthusiastically. 'It goes so awfully well together, too, Hugh Massinger. There's a great deal in names going well together. I wouldn't marry a man called Adair, now, Elsie, or O'Dowd, either, not if you were to pay me for it (though why you should pay me, I'm sure I don't know), for Winifred Adair doesn't sound a bit nice; and yet Elsie Adair goes just beautifully.—Winifred Challoner—that's not bad, either. Three syllables, with the accent on the first. Winifred Massinger—that sounds very well too; best of all, perhaps. I shouldn't mind marrying a man named Massinger.'

'Other things equal,' Elsie put in laughing.

'Oh, of course he must have a moustache,' Winifred went on in quite a serious voice.

'Even if a man was a poet, and was called Massinger, and had lovely eyes, and could sing like a nightingale, but hadn't a moustache—a beautiful, long, wiry, black moustache, like the curate's at Snade—I wouldn't for the world so much as look at him. No close-shaven young man need apply. I insist upon a moustache as absolutely indispensable. Not red: red is quite inadmissible. If ever I marry—and I suppose I shall have to, some day, to please papa—I shall lay it down as a fixed point in the settlements, or whatever you call them, that my husband must have a black moustache, and must bind himself down by contract beforehand as long as I live never to shave it.'

Elsie shaded her eyes with her hand and looked out seaward. 'I shan't let you talk so any more, Winnie,' she said, with a vigorous effort to be sternly authoritative. 'It isn't right; and you know it isn't. The instructress of youth must exert her authority. We ought to be as grave as a couple of church owls.—What a funny small sailing-boat that is on the sea out yonder! A regular little tub! So flat and broad! She's the roundest boat I ever saw in my life. How she dances about like a walnut-shell on the top of the water!'

'Oh, that's the *Mud-Turtle*!' Winifred cried eagerly, anxious to display her nautical knowledge to the full extent before Elsie, the town-bred governess. 'She's a painter's yawl, you know. I've seen her often. She belongs to an artist, a marine artist, who comes this way every summer to sketch and paint mud-banks.'

'She's coming in here now, I think,' Elsie murmured, half aloud.—'O no; she's not; she's gone beyond it, towards the point at Walberswick.'

'That's only to tack,' Winifred answered with conscious pride in her superior knowledge. 'She's got to tack because of the wind, you know. She'll come up the creek as soon as she catches the breeze. She'll luff soon.—Look there, now; they're luffing her. Then in a minute they'll put her about a bit, and tack again for the creek's mouth.—There you are, you see: she's tacking, as I told you.—That's the artist, the shorter man in the sailor's jersey. He looks like a common A.B. when he's got up so in his seafaring clothes; but when you hear him speak, you can tell at once by his voice he's really a gentleman. I don't know who the second man is, though, the tall man in the tweed suit—he's not the one that generally comes—that's Mr Potts. But, oh, isn't he handsome! I wonder if they're going to sail close alongside. I do hope they are. The water's awfully deep right in by the poplar here. If they turn up the creek, they'll run under the roots just below us.—They seem to be making signs to us now.—Why, Elsie, the man in the tweed suit's waving his hand to you!'

Elsie's face was crimson to look upon. As the instructress of youth, she felt herself distinctly discomposed. 'It's my cousin,' she cried, jumping up in a tremor of excitement and waving back to him eagerly with her tiny handkerchief. 'It's Hugh Massinger! How very delightful! He must have come down by sea with the painter.'

'They're going to run in just close by the tree,' Winifred exclaimed, quite excited also at the sudden apparition of the real live poet. 'O Elsie,

doesn't he just look poetical! A man with a face and eyes like that couldn't help writing poetry, even if he didn't want to. He must be a friend of Mr Relf's, I suppose. What a lovely, romantic, poetical way to come down from London—tossing about at sea in a glorious breeze on a wee bit of a tub like that funny little *Mud-Turtle*!

By this time, the yawl, with the breeze in her sails, had run rapidly before the wind for the mouth of the river, and was close upon them by the roots of the poplar. As it neared the tree, Hugh stood up on the deck, bronzed and ruddy with his three days' yachting, and called out cheerily in a loud voice: 'Hillo, Elsie, this is something like a welcome! We arrive at the port, after a stormy passage on the high seas, and are met at its mouth by a deputation of the leading inhabitants. Shall we take you on board with your friend at once, and carry you up the rest of the way to Whitestrand?'

Elsie's heart came up into her mouth. She would have given the world to be able to cry out cordially: 'O Hugh, that'd be just lovely;' but propriety and a sense of the duties of her position compelled her instead to answer in a set voice: 'Well, thank you; it's ever so kind of you, Hugh; but we're here in our own grounds, you know, already.—This is Miss Meysey, Winifred Meysey: Winnie, this is my cousin Hugh, dear. Now you know one another.—Hugh, I'm so awfully glad to see you!'

Warren Relf turned the bow toward the tree, and ran the yawl close alongside till her tiny taffrail almost touched the roots of the big poplar. 'That's better,' he said.—'Now, Massinger, introduce us. You do it like a Lord Chamberlain, I know.'

'You won't come up with us, then, Miss Chal-loner?' asked Hugh.

Elsie bent her head. 'We mustn't,' she said candidly, 'though I own I should like it. It's so very long since I've seen you, Hugh. Where are you going to stop at in the village? You must come up this very afternoon to see me.'

Hugh bowed a bow of profound acquiescence. 'If you say so,' he answered with less languor than his wont, 'your will is law. We shall certainly come up.—I suppose I may bring my friend Relf with me—the owner and skipper of this magnificent and luxurious vessel?—We've had the most delightful passage down, Elsie. I never in my life felt anything like it. The blood of the old Sea-kings comes up in my veins, and I've been rhyming "viking" and "liking," and "striking" and "diking" ever since we got well clear of London Bridge, till this present moment.—I shall write a volume of Sonnets of the Sea, and dedicate them duly to you—and Miss Meysey.'

As for Winifred, with a red rose spreading over all her face, she said nothing; but twirling her hat still in her hand, she gazed and gazed open-eyed, and almost open-mouthed—except that an open mouth is so very unbecoming—upon the wonderful stranger with the big dark eyes, who had thus dropped down from the clouds upon the manor of Whitestrand.

'I'll put her in nearer,' Warren Relf said quietly, after a few minutes, glancing with mute admiration at Elsie's beautiful face and slim figure.—'We'll lie by here for half an hour,

Hugh, and if you prefer it, I'll put you ashore, and you can walk up through the grounds of the Hall, while I navigate the ship to the *Fisherman's Rest*, up yonder at Whitestrand.'

As he spoke, he put over the boom for a moment, to lay her in nearer to the roots of the tree. It was an unlucky movement. Winifred was sitting close to the water's edge, with her hat in her hand, dangling over the side. The boom, flapping suddenly in the wind with an unexpected twirl, struck her wrist a smart blow, and made her drop the hat with a cry of pain into the current of the river. Tide was on the ebb; and almost before they had time to see what had happened, the hat had floated on the swift stream far out of reach, and was careering hastily in circling eddies on its way seaward.

Hugh Massinger was too good an actor, and too good a swimmer into the bargain, to let slip such a splendid opportunity for a bit of cheap and effective theatrical display. The eyes of Europe and of Elsie were upon him—not to mention the unknown young lady, who, for aught he knew to the contrary, might perhaps turn out to be a veritable heiress to the manor of Whitestrand. In a second, he had pulled off his coat and boots—sprung lightly to the further deck of the *Mud-Turtle*, and taken a header in his knickerbockers and stockings and flannel shirt into the muddy water. In nothing does a handsome man look handsomer than in knickerbockers and flannels. The tide was setting strong in a fierce stream round the corner of the tree, and a few stout strokes, made all the stouter by the consciousness of an admiring trio of spectators, brought the eager swimmer fairly abreast of the truant hat in mid-current. He grasped it hastily in his outstretched hand, waved it with a flourish high above his head, and gave it a twist or two of playful triumph, all wet and dripping, in his graceful fingers, before he turned. An act of daring is nothing if not gracefully or masterfully performed. And then he wheeled round to swim back to the yawl again.

In that, however, he had reckoned clearly without his host. The water proved in fact a most inhospitable entertainer. Hand over hand, he battled hard against the rapid current, tying the recovered hat loosely around his neck by its ribbon strings, and striking out vigorously with his cramped and trammelled legs in the vain effort to stem and breast the rushing water. After thirty or forty strokes, he looked in front of him casually, and saw, to his surprise, not to say discomfiture, that he was farther away from the yawl than ever. This was distressing—this was even ignominious; to any other man than Hugh Massinger, it would indeed have been actually alarming. He only thought to himself how ridiculous and futile he must needs look to that pair of womankind in having attempted with so light a heart a feat that was utterly beyond his utmost powers.

Vanity is a mighty ruler of men. If Hugh Massinger had stopped there till he died, he would never have called aloud for help. Better peace with honour, on the damp bed of a muddy stream, than the shame and sin of confessing one's self openly beaten in fair fight by a mere insignificant tidal river. It was Elsie who first recognised the straits he was in—for though love is blind, yet love is

sharp-eyed—and cried out to Warren Relf in an agony of fear: 'He can't get back! The stream's too much for him!—Quick, quick! You've not a moment to lose! Put about the boat at once and save him!'

With a hasty glance, Relf saw she was right, and that Hugh was unable to battle successfully with the rapid current. He turned the yawl's head with all speed outward, and took a quick tack to get behind the baffled swimmer and intercept him, if possible, on his way toward the sea, whither he was now so quickly and helplessly drifting.

CHAPTER IV.—BURIDAN'S ASS.

For a minute the two girls stood in breathless suspense: then Warren Relf, cutting in behind with the yawl, flung out a coil of rope in a ring towards Hugh with true seafaring dexterity, so that it struck the water straight in front of his face flat like a quoit, enabling him to grasp it and haul himself in without the slightest difficulty. The help came in the nick of time, yet most inopportunist. Hugh would have given worlds just then to be able to disregard his proffered aid, and to swim ashore by the tree in lordly independence without extraneous assistance. It is grotesque to throw yourself wildly in, like a hero or a Leander, and then have to be tamely pulled out again by another fellow. But he recognised the fact that the struggle was all in vain, and that the interests of English literature and of a well-known insurance office in which he held a small life policy, imperatively demanded acquiescence on his part in the friendly rescue. He grasped the rope with a very bad grace indeed, and permitted Relf to haul him in, hand over hand, to the side of the *Mud-Turtle*.

Yet, as soon as he stood once more on the yawl's deck, dripping and unpicturesque in his clinging clothes, but with honour safe, and the lost hat now clasped tight in his triumphant right hand, it began to occur to him that, after all, the little adventure had turned out in its way quite as romantic, not to say effective, as could have been reasonably expected. He forgave himself his wet and unbecoming attire, as he handed the hat, with as graceful a bow as circumstances permitted, from the yawl's side to Winifred Meysey, who stretched out her hands, all blushes and thanks and apologetic regrets, from the roots of the poplar by the edge, to receive it.

'And now, Elsie,' Hugh cried, with such virile cheerfulness as a man can assume who stands shivering in wet clothes before a keen east wind, 'perhaps we'd better make our way at once up to Whitestrand without further delay to change our garments.—Miss Meysey, I'm afraid your hat's spoiled.—Put her about now, Relf. Let's run up quick. I don't mind how soon I get to Whitestrand.'

Warren Relf headed the yawl round with the wind, and they ran merrily before the stiff breeze up stream towards the village.

'O Elsie,' cried Winifred, 'it was so grand! Wasn't it just magnificent of him to jump in like that after my poor old straw? I never saw anything so lovely in my life. Exactly like the sort of things one reads about in novels!'

Elsie smiled a more sober smile of maturer appreciation. 'Hugh's always so,' she answered,

with proprietary pride in her manly and handsome and chivalrous cousin.

The men made their way up stream to Whitestrand, and landed at last, with an easy run, beside the little hithe. At the village inn—the *Fisherman's Rest*, by W. Stannaway—Hugh Massinger, in spite of his disreputable dampness, soon obtained comfortable board and lodging, on Warren Relf's recommendation. Relf was in the habit of coming to Whitestrand frequently, and was 'well-known,' as the landlord remarked, to the entire village, children included, so that any of his friends was immediately welcome at the quaint old public-house by the water's edge.

'I'll change my clothes in a jiffy,' the poet cried to his friend as he leapt ashore, 'and be back with you at once, a new creature.'

In ten minutes he emerged again, as he had predicted, in the front room, another man—an avatar of glory—resplendent in a light-brown velvet coat and Rembrandt cap, that served still more obviously than ever to emphasise the full nature and extent of his poetical pretensions. It was a coat that a laureate might have envied and dreamt about. The man who could carry such a coat as that could surely have written the whole of the *Divina Commedia* before breakfast, and tossed off a book or two of *Paradise Lost* in a brief interval of morning leisure.

'Awfully pretty girl that,' he said as he entered, and drummed on the table with impatient forefinger for the expected steak: 'the little one, I mean, of course—not my cousin. Fair, too. In some ways I prefer them fair. Though dark girls have more go in them, after all, I fancy; for dark and true and tender is the North, according to Tennyson. But fair or dark, North or South, like Horniman's teas, they're "all good alike," if you take them as assorted. And she's charmingly fresh and youthful and naive.'

'She's pretty, certainly,' Warren Relf replied with a certain amount of unusual stiffness apparent in his manner; 'but not anything like so pretty, to my mind, or so graceful either, as your cousin, Miss Challoner.'

'Oh, Elsie's well enough in her own way, no doubt,' Hugh went on with a smile of expansive admiration. 'I like them all in their own way. I'm nothing, indeed, if not catholic and eclectic. On the whole, one girl's much the same as another, if only she gives you the true poetic thrill. But the other—Miss Meysey, now—who's she, I wonder?—Good name, Meysey. It sounds like money, and it suggests daisy. There was a Meysey a banker in the Strand, you know—not very daisy-like, that, is it?—and another who did something big in the legal way—a judge, I fancy. He doubtless sat on the royal bench of British Themis with immense applause (which was instantly suppressed), and left his family a pot of money. Meysey—lazy—crazy—hazy. None of them'll do, you see, for a sonnet but daisy.—How many more Miss Meyseys are there, if any? I wonder. And if not, has she got a brother? So pretty a girl deserves to have tin. If I were a childless, rich old man, I think I'd inconspicuously establish and endow her, just to improve the beauty and the future of the race, on the strictest evolutionary and Darwinian principles.'

'Her father's the Squire here,' Warren Relf replied, with a somewhat uneasy glance at Hugh, shot sideways. 'He lords the manor and a great part of the parish. Wyville Meysey's his full name. He's rich, they say, tolerably rich still; though a big slice of the estate south of the river has been swallowed up by the sea, or buried in the sand, or otherwise disposed of. But north of the river, they say he's all right. That's his place, the house in the fields, just up beyond the poplar. I daresay you didn't notice it as we passed, for it's built low—Elizabethan, half-hidden in the trees. All the big houses along the East Coast are always planned rather squat and flat, to escape the wind, which runs riot here in the winter. The old gentleman's connected with the bankers in the Strand—some sort of a cousin or other, more or less distantly removed, I fancy.'

'And the sons?' Hugh asked, with evident interest, tracking the subject to its solid kernel.

'The sons? There are none. They had one once, I believe—a dragoon or hussar—but he was shot, out soldiering in Zululand or somewhere; and this daughter's now the sole living representative of the entire family.'

'So she's an heiress?' Hugh inquired, getting warmer at last, as children say at Hide-and-seek.

'Ye-es. In her way—no doubt, an heiress.—Not a very big one, I suppose, but still what one might fairly call an heiress. She'll have whatever's left to inherit.—You seem very anxious to know all about her.'

'Oh, one naturally likes to know where one stands—before committing one's self to anything foolish,' Hugh murmured placidly. 'And in this wicked world of ours, where heiresses are scarce—and actions for breach of promise painfully common—one never knows beforehand where a single false step may happen to land one. I've made mistakes before now in my life; I don't mean to make another one through insufficient knowledge, if I can help it.'

He took up a pen that lay before him upon the table of the little sitting-room, and began drawing idly with it some curious characters on the back of an envelope he pulled from his pocket. Relf sat and watched him in silence.

Presently, Massinger began again. 'You're very much shocked at my sentiments, I can see,' he said quietly, as he glanced with approval at his careless hieroglyphics.

Relf drew his hand over his beard twice. 'Not so much shocked as grieved, I think,' he replied after a moment's pause.

'Why grieved?'

'Well, because, Massinger, it was impossible for any one who saw her this morning to doubt that Miss Challoner is really in love with you.'

Hugh went on fiddling with the pen and ink and the envelope nervously. 'You think so?' he asked, with some eagerness in his voice, after another short pause. 'You think she really likes me?'

'I don't merely think so,' Relf answered with confidence; 'I'm absolutely certain of it—as sure as I ever was of anything. Remember, I'm a painter, and I have a quick eye. She was deeply moved when she saw you come.

It meant a great deal to her.—I should be sorry to think you would play fast and loose with any girl's affections.'

'It's not the girl's affections I play fast and loose with,' Massinger retorted lazily. 'I deeply regret to say it's very much more my own I trifle with. I'm not a fool; but my one weak point is a too susceptible disposition. I can't help falling in love—really in love—not merely flirting—with any nice girl I happen to be thrown in with. I write her a great many pretty verses; I send her a great many charming notes; I say a great many foolish things to her; and at the time I really mean them all. My heart is just at that precise moment the theatre of a most agreeable and unaffected flutter. I think to myself, "This time, it's serious." I look at the moon, and feel sentimental. I apostrophise the fountains, meadows, valleys, hills, and groves to forebode not any severing of our loves. And then I go away and reflect calmly, in the solitude of my own chamber, what a precious fool I've been—for, of course, the girl's always a penniless one—I've never had the luck or the art yet to captivate an heiress; and when it comes to breaking it all off, I assure you it costs me a severe wrench, a wrench that I wish I was sensible enough to foresee or adequately to guard against, on the prevention-better-than-cure principle.'

'And the girl?' Relf asked, with a growing sense of profound discomfort, for Elsie's face and manner had instantly touched him.

'The girl,' Massinger replied, putting a finishing stroke or two to the queer formless sketch he had scrawled upon the envelope, and fixing it up in the frame of a cheap lithograph that hung from a nail upon the wall opposite: 'well, the girl probably regrets it also, though not, I sincerely trust, so profoundly as I do. In this case, however, it's a comfort to think Elsie's only a cousin. Between cousins there can be no harm, you will readily admit, in a little innocent flirtation.'

'It's more than a flirtation to her, I'm sure,' Relf answered, with a dubious shake of his head. 'She takes it all *au grand sérieux*.—I hope you don't mean to give her one of these horrid wrenches you talk so lightly about?—Why, Massinger, what on earth is this? I—I didn't know you could do this sort of thing!'

He had walked across carelessly, as he paced the room, to the lithograph in whose frame the poet had slipped the back of his envelope, and he was regarding the little addition now with eyes of profound astonishment and wonder. The picture was a coarsely executed portrait of a distinguished statesman, reduced to his shirt-sleeves, and caught in the very act of felling a tree; and on the scrap of envelope, in exact imitation of the right honourable gentleman's own familiar signature, Hugh had written in bold free letters the striking inscription, 'W. E. Gladstone.'

The poet laughed. 'Yes, it's not so bad,' he said, regarding it from one side with parental fondness. 'I can imitate anybody's hand at sight.—Look here, for example; here's your own.' And taking another scrap of paper from a bundle in his pocket, he wrote, with rapid and practised mastery, 'Warren H. Relf' on a corner of the sheet in the precise likeness of the painter's own large and flowing handwriting.

Relf gazed over his shoulder in some surprise,

not wholly unmingled with a faint touch of alarm. 'I'm an artist, Massinger,' he said slowly, as he scanned it close; 'but I couldn't do that, no, not if you were to pay me for it. I could paint anything you chose to set me, in heaven above, or earth beneath, or the waters that are under the earth; but I couldn't make a decent fac-simile of another man's autograph.—And, do you know, on the whole I'm awfully glad that I could never possibly learn to do it.'

Massinger smiled a languid smile. 'In the hands of the foolish,' he said, addressing his soul to the beefsteak which had at last arrived, 'no doubt such abilities are liable to serious abuse.'

RAILWAY-TRAIN TELEGRAPHY.

TELEGRAPHING to and from trains in motion is a method of communication possessing so many evident advantages, that the efforts of men eminent in this branch of science have during recent years been perseveringly directed against the very great difficulties which up to the present time have defied all attempts to solve in a practical manner this most important application of the art of telegraphy. Such efforts richly deserve the success with which they have been rewarded; and the month of October 1887, in which the experimental trials gave such satisfactory results, will mark an epoch in the history of the progress of this wonderful science.

Like a great many others connected with the successful diversion of the electric current during recent years into channels which supply the wants and wishes of man, this problem has been worked out by American scientists, whose labours in this particular field produce a richer harvest than elsewhere. We first of all hear of a patent being issued to Mr Wiley Smith by the United States in 1881; then of the practical experiments on the New York, Newhaven, and Hartford Railroad, carried on with remarkable success by Mr Phelps in 1885; and now, in 1887, we hear of the improved Phelps's system working most satisfactorily over the Lehigh Valley Railroad in the presence of two hundred and thirty witnesses. In this system Mr Phelps is assisted by the devices of such eminent electricians as Edison, Gilliland, and Smith; and so perfect is it, that a train running at the rate of sixty miles an hour can send or receive messages without difficulty. To convey a message along a wire is no longer a surprise to ordinary minds in civilised countries; but to convey a message where, as in the case of a moving train, there can be no stationary wire, must seem little less than miraculous to minds ignorant of the power of inductive influence possessed by the electric current. This inductive power is so great, however, that, under the skilful management of the inventors whose names are given above, the message jumps, as it were, from the telegraph wires to the train, or *vice versa*, over a distance of more than twenty feet. To give a general idea of the manner in which the transmission is accomplished, we purpose to describe in simple language the method first tried by Phelps in 1885, which in principle does not differ from that now adopted.

He laid a well-insulated wire between the rails for the purpose of conveying messages to and from the train. This wire was connected by ordi-

nary telegraph wires with the instruments in the stations. In order to establish communication between these instruments and the ones in the train, it was of course necessary that a special telegraph car should be constructed. Below this car, and at a height of only seven inches above the wire between the rails, was suspended a two-inch iron pipe, containing a continuous coil or circuit of insulated copper wire about a mile and a half long. One end of this wire was carried to the roof of the car, and thence to the instruments inside. Now, suppose a message is being transmitted along the wire between the rails, the electric current flowing along this wire acts inductively on the mile-and-a-half coil attached to the telegraph car. The message is conveyed from this coil to the car in the ordinary way; but as the induced current set up in this coil is a very feeble one, it requires to be strengthened before it can be turned to any practical use.—The current in this coil as truly represents that in the wire between the rails as a reflection in the water represents an object in the atmosphere above; and as the reflection is dimmer than the object, so also, in this case, is the induced or secondary current feebler than the primary.—This strengthening process is accomplished by means of what electricians call a 'relay,' which is simply an instrument ingeniously designed for the purpose of admitting the influx of a current of electricity from a battery at the receiving station. The first current is but a tiny rivulet, the tributary current is a mighty river; but the characteristics of the former, instead of being lost in the volume of the latter, are accentuated and magnified, and so the message becomes audible. To understand more clearly the action of the relay, the reader may be reminded that messages are conveyed by means of frequent interruptions of the electric current as it passes along the wire; the relay at every interruption of the first current cuts off the current from the local battery, but admits it during the intervals between the interruptions, and thus the message is strengthened without being otherwise altered.

There are other instruments and arrangements besides those already mentioned, but we cannot describe them here. One, however, must not be omitted. It is called a 'buzzer,' from the resemblance of the sound it produces to the buzzing of a bee. It is a rapid current-breaker at regular intervals, and was specially designed for this purpose by Mr Phelps. Current-breakers are common enough in electric apparatus of various kinds. The ordinary electric bell is worked by a current-breaker; the electric machines so common in the streets possess current-breakers; the induction coil of Ruhmkorff also possesses a current-breaker. Phelps's 'buzzer' is similar in principle. The sound of the buzzer, although, strictly speaking, the very reverse of continuous, appears to be unbroken. When messages are transmitted, the sound is broken by means of the Morse key into the usual signals for letters; and the sensibly and irregularly interrupted sounds now find their way to a telephone, which, for the sake of convenience, is strapped to the head of the official who interprets the words which reach his ear under the (to him) familiar guise of the Morse alphabet.

Such, then, is the outline of the Phelps's system

of 1885. Time has effected many improvements on it, a few of which we will mention. In the first place, the wire laid between the rails is dispensed with, an ordinary telegraph line fixed on poles about sixteen feet high and eight feet from the rails having been found to answer every purpose. The latter is of course much cheaper, and is less likely from its position to suffer damage. In the second place, the mile-and-a-half of wire coiled in the two-inch pipe beneath the telegraph car is rejected, as a natural consequence of the preceding. Instead of it, the roof-sheathing of the car, which is usually of metal, is made to do duty; and when the metallic sheathing is absent, a tube or rod half an inch in diameter carried along the eaves the entire length of the train, is equally serviceable. On the whole, the improvements tend towards economy and convenience, but do not at all interfere with the principle of the Phelps's system.

Already messages are being sent by this means, the charges being only ten cents in addition to Western Union rates. Not more than fifty-five miles of the Lehigh Valley Railroad are yet fitted with the necessary appliances; but the system is being extended to the entire line as rapidly as possible; and other railway Companies are making arrangements for adopting it.

The advantages of such a system cannot be over-estimated. Not only can business men send telegrams while travelling, but the guard of the train and the traffic superintendent can be in constant communication with each other, and the guard of one train can signal to the guard of another. If only the number of serious railway accidents—which are becoming more and more disastrous as speed is increased and implicit trust reposed in instantaneous brakes—is diminished, the advent of this new invention should be welcomed; but whatever may be its future, we must agree with Colonel Gourand, who, at the dinner held subsequent to the recent trial, declared that, accustomed as he was to electrical surprises, that day's performances had been to him a 'revelation.'

THE GOLDEN INCUBUS.

CHAPTER IV.—A LITTLE SKIRMISH.

I DIDN'T believe in the people opposite, in spite of their references being said to be good. You may say that's because of what followed; but it isn't, for I didn't like the looks of the stiff elderly Miss Mimprisses; and I didn't like the two forward servants, though they seemed to keep themselves to themselves wonderfully, and no man ever allowed in the house. Worst of all, I didn't like that handsome young Miss Adela, sitting at work over coloured worsted at the dining-room or drawing-room window, for young Mr Barclay was always looking across at her; and though he grew red-faced, my poor Miss Virginia grew every day more pale.

They seemed very strange people over the way, and it was only sometimes on a Sunday that any one at our place caught a glimpse of them, and then one perhaps would come to a window for a few minutes and sit and talk to Miss Adela—one of the elder sisters, I mean; and when I caught sight of them, I used to think

that it was no wonder they had taken to dressing so primly and so plain, for they must have given up all hope of getting husbands long before.

Mr Barclay suggested to Sir John twice in my hearing that he should invite his new tenants over to dinner; and once, in a hesitating way, hinted something about Miss Virginia calling. But Sir John only grunted; while I saw my dear young lady dart such an indignant look at Mr Barclay as made him silent for the rest of the evening, and seem ashamed of what he had said.

I talked about it a good deal to Tom as I sat before my pantry fire of an evening; and he used to leap up in my lap and sit and look up at me with his big eyes, which were as full of knowingness at those times as they were stupid and slit-like at others. He was a great favourite of mine was Tom, and had been ever since I found him, a half-starved kitten in the area, and took him in and fed him till he grew up the fine cat he was.

'There's going to be trouble come of it, Tom,' I used to say; and to my mind, the best thing that could have happened for us would have been for over-the-way to have stopped empty; for, instead of things going on smoothly and pleasantly, they got worse every day. Sir John said very little, but he was a man who noticed a great deal. Mr Barclay grew restless and strange, but he never said a word now about going away. While, as for Miss Virginia, she seemed to me to be growing older and more serious in a wonderful way; but when she was spoken to, she had always a pleasant smile and a bright look, though it faded away again directly, just as the sunshine does when there are clouds. She used to pass the greater part of her time reading to Sir John, and she kept his accounts for him and wrote his letters; and one morning as I was clearing away the breakfast things, Mr Barclay being there, reading the paper, Sir John says sharply: 'Those people opposite haven't paid their first quarter's rent.'

No one spoke for a moment or two, and then in a fidgety sharp way, Mr Barclay says: 'Why,' it was only due yesterday, father.'

'Thank you, sir,' says Sir John, in a curiously polite way; 'I know that; but it was due yesterday, and it ought to have been paid.—'Ginny, write a note to the Misses Mimpriss with my compliments, and say I shall be obliged by their sending the rent.'

Miss Virginia got up and walked across to the writing-table; and I went on very slowly clearing the cloth, for Sir John always treated me as if I was a piece of furniture; but I felt uncomfortable, for it seemed to me that there was going to be a quarrel.

I was right; for as Miss Virginia began to write, Mr Barclay crushed the newspaper up in his hands and said hotly: 'Surely, father, you are not going to insult those ladies by asking them for the money the moment it is due.'

'Yes, I am, sir,' says the old gentleman sharply; 'and you mind your own business. When I'm dead, you can collect your rents as you like; while I live I shall do the same.'

Miss Virginia got up quickly and went and laid her hand upon Sir John's breast without

saying a word; but her pretty appealing act meant a deal, and the old man took the little white hand in his and kissed it tenderly. 'You go and do as I bid you, my pet,' he said; 'and you, Burdon, wait for the note, take it over, and bring an answer.'

'Yes, Sir John,' I said quietly; and I heard Miss Virginia give a little sob as she went and sat down and began writing. Then I saw that the trouble was coming, and that there was to be a big quarrel between father and son.

'Look here, father,' says Mr Barclay, getting up and walking about the room, 'I never interfere with your affairs'—

'I should think not, sir,' says the old man, very sarcastic-like.

'But I cannot sit here patiently and see you behave in so rude a way to those four ladies who honour you by being your tenants.'

'Say I feel greatly surprised that the rent was not sent over yesterday, my dear,' says Sir John, without taking any notice of his son.

'Yes, uncle,' says Miss Virginia. She always called him 'uncle,' though he wasn't any relation.

'It's shameful!' cried Mr Barclay. 'The result will be that they will give you notice and go.'

'Good job too,' said Sir John. 'I don't like them, and I wish they had not come.'

'How can you be so unreasonable, father?' cried the young man hotly.

'Look here, Bar,' says Sir John ('Fold that letter and seal it with my seal, 'Ginny')—'look here, Bar.'

I glanced at the young man, and saw him pass his hand across his forehead so roughly that the big signet ring he wore—the old-fashioned one Sir John gave him many years before, and which fitted so tightly now that it wouldn't come over the joint—made quite a red mark on his brow.

'I don't know what you are going to say, father,' cried Mr Barclay quickly; 'but, for heaven's sake, don't treat me as a boy any longer, and I implore you not to send that letter.'

There was a minute's silence, during which I could hear Mr Barclay breathing hard. Then Sir John began again. 'Look here, sir,' he said. 'Over and over again, you've wanted to go away and travel, and I've said I didn't want you to go. During the past three months you've altered your mind.'

'Altered my mind, sir?' says the young man sharply.

'Yes, sir; and I've altered mine. That's fair. Now, you don't want to go, and I want you to.'

'Uncle!'

'Have you done that letter, my pet?—Yes? That's well. Now, you stand there and take care of me, for fear Mr Barclay should fly in a passion.'

'Sir, I asked you not to treat me like a boy,' says Mr Barclay bitterly.

'I'm not going to,' says Sir John, as he sat playing with Miss Virginia's hand, while I could see that the poor darling's face was convulsed, and she was trying to hide the tears which streamed down. 'I'm going to treat you as a man. You can have what money you want. Be off for a

year's travel. Hunt, shoot, go round the world, what you like; but don't come back here for a twelvemonth.—Burdon, take that letter over to the Misses Mimpriss, and wait for an answer.'

I took the note across, wondering what would be said while I was gone, and knowing why Sir John wanted his son to go as well as he did, and Miss Virginia too, poor thing.

The knocker seemed to make the house opposite echo very strangely, as I thumped; but when the door was opened in a few minutes, everything in the hall seemed very proper and prim, while the maid who came looked as stiff and disagreeable as could be.

'For Miss Mimpriss, from Sir John Drinkwater,' I said; 'and I'll wait for an answer.'

'Very well,' says the woman shortly.

'I'll wait for an answer,' I said, for she was shutting the door.

'Yes; I heard,' she says, and the door was shut in my face.

'Hang all old maids!' I said. 'They needn't be afraid of me;' and there I waited till I heard steps again and the door was opened; and the ill-looking woman says in a snappish tone: 'Miss Adela Mimpriss's compliments, and she'll come across directly.'

'Any one would think I was a wild beast,' I said to myself, as I went back and gave my message, finding all three in the room just as I had left them when I went away.

CHAPTER V.—JAMES BURDON SMELLS FIRE.

Mr Barclay followed me out, and as soon as we were in the hall, 'Burdon,' he says, 'you have a bunch of small keys, haven't you?'

'Yes, Master Barclay, down in my pantry.'

'Lend them to me: I want to try if one of them will fit a lock of mine.'

He followed me down; and I was just handing them to him, when there was a double knock and a ring, and I saw him turn as red as a boy of sixteen found out at some trick.

I hurried up to open the door, leaving him there, and found that it was Miss Adela Mimpriss.

'Will you show me in to Sir John?' she says, smiling; and I did so, leaving them together; and going down-stairs, to see Mr Barclay standing before the fire and looking very strange and stern. He did not say anything, but walked up-stairs again; and I could hear him pacing up and down the hall for quite a quarter of an hour before the bell rang; and then I got up-stairs to find him talking very earnestly to Miss Adela Mimpriss, and she all the time shaking her head and trying to pull away her hand.

I pretended not to see, and went into the dining-room slowly, to find Miss Virginia down on her knees before Sir John, and him with his two hands lying upon her bent head, while she seemed to be sobbing.

'I did not ring, Burdon,' he said huskily.

'Beg pardon, Sir John; the bell rang.'

'Ah, yes. I forgot—only to show that lady out.'

I left the room; and as I did so, I found the front door open, and Mr Barclay on the step, looking across at Miss Adela Mimpriss, who was just tripping up the steps of the house opposite;

and I saw her use a latchkey, open the door, and look round as she was going in, to give Mr Barclay a laughing look; and then the door was closed, and my young master shut ours.

That day and the next passed quietly enough; but I could see very plainly that there was something wrong, for there was a cold way of speaking among our people in the dining-room, the dinner going off terribly quiet, and Sir John afterwards not seeming to enjoy his wine; while Miss Virginia sat alone in the drawing-room over her tea; and Mr Barclay, after giving me back my keys, went up-stairs, and I know he was looking out, for Miss Adela Mimpriss was sitting at the window opposite, and I saw her peep up twice.

This troubled me a deal, for, after all those years, I never felt like a servant, but as if I was one of them; and it made me so upset, that, as I lay in my bed in the pantry that night wondering whether Mr Barclay would go away and forget all about the young lady opposite, and come back in a year and be forgiven, and marry Miss Virginia, I suddenly thought of my keys.

'That's it,' I said. 'It was to try the lock of his portmanteau. He means to go, and it will be all right, after all.'

But somehow, I couldn't sleep, but lay there pondering, till at last I began to sniff, and then started up in bed, thinking of Edward Gunning.

'There's something wrong somewhere,' I said to myself, for quite plainly I could smell burning—the oily smell as of a lamp, a thing I knew well enough, having trimmed hundreds.

At first, I thought I must be mistaken; but no—there it was, strong; and jumping out of bed, I got a light; and to show that I was not wrong, there was my cat Tom looking excited and strange, and trotting about the pantry in a way not usual unless he had heard a rat.

I dressed as quickly as I could, and went out into the passage. All dark and silent, and the smell very faint. I went up-stairs and looked all about; but everything was as I left it; and at last I went down again to the pantry, thinking and wondering, with Tom at my heels, to find that the smell had passed away. So I sat and thought for a bit, and then went to bed again; but I didn't sleep a wink, and somehow all this seemed to me to be very strange.

CHAPTER VI.—A SUDDEN CHANGE.

If any one says I played spy, I am ready to speak up pretty strongly in my self-defence, for my aim always was to do my duty by Sir John my master; but I could not help seeing two or three things during the next fortnight, and they all had to do with a kind of telegraphing going on from our house to the one over the way, where Miss Adela generally appeared to be on the watch; and her looks always seemed to me to say: 'No; you mustn't think of such a thing,' and to be inviting him all the time. Then, all at once I thought I was wrong, for I went up as usual at half-past seven to take Mr Barclay's boots and his clothes which had been brought down the night before, after he had dressed for dinner. I tapped and went in, just as I'd always done ever since he was a boy, and went across to the window and drew the curtains. 'Nice morning, Master Barclay,' I

said. 'Half-past'— There I stopped, and stared at the bed, which all lay smooth and neat, as the housemaid had turned it down, for no one had slept in it that night. I was struck all of a heap, and didn't know what to think. To me it was just like a silver spoon or fork being missing, and setting one's head to work to think whether it was anywhere about the house.

He hadn't stopped to take his wine with Sir John after dinner; but that was nothing fresh, for they'd been very cool lately. Then I hadn't seen him in the drawing-room; but that was nothing fresh neither, for he had avoided Miss Virginia for some little time.

'It is very strange,' I thought, for I had not seen him go out; and then, all at once I gave quite a start, for I felt that he must have done what Sir John had told him to do—gone.

'That won't do,' I said directly after. 'He wouldn't have gone like that;' and I went straight to Sir John's room and told him, as in duty bound, what I had found out, for Mr Barclay was not the young man to be fast and stop out of nights and want the servants to screen him. There was something wrong, I felt sure, and so I said.

'No,' said the old gentleman, as he sat up in bed, and then began to dress; 'he wouldn't go at my wish; but that jade over the way is playing with him, and he is too proud to stand it any longer, besides being mortified at making such an ass of himself. There's nothing wrong, Burdon. He has gone, and a good job too.'

Of course, I couldn't contradict my master; but I went up and examined Mr Barclay's room, to find nothing missing, not so much as a shirt or a pair of socks, only his crush-hat, and the light overcoat from the brass peg in the front hall; and I shook my head.

Miss Virginia looked paler than ever at breakfast; but nothing more was said up-stairs. Of course, the servants gossiped; and as it was settled that Mr Barclay had done what his father had told him, a week passed away, and matters settled down with Miss Adela Mimpriss sitting at the window just as usual, doing worsted-work, and the old house looking as grim as ever, and as if a bit of paint and a man to clean the windows would have been a blessing to us all.

Every time the postman knocked, Miss Virginia would start; and her eyes used to look so wild and large, that when I'd been to the little box and found nothing from Mr Barclay, I used to give quite a gulp; and many's the time I've stood back in the dining-room and shook my fist at Miss Adela sitting so smooth and handsome at the opposite house, and wished she'd been at the world's end before she came there.

CHAPTER VII.—A TERRIBLE DISCOVERY.

Mr Barclay had been gone three weeks, and no news from him; and I was beginning to think that he had gone off in a huff all at once, though I often wondered how he would manage for want of money, when one night, as I sat nursing Tom, I thought I'd look through my desk, that I hadn't opened for three or four years, and have a look at a few old things I'd got there—a watch Sir John gave me, but which I never wore; six spade-ace guineas; and an old gold pin, beside a few odds

and ends that I'd had for a many years; and some cash. Tom didn't seem to like it, and he stared hard at the desk as I took it on my knees, opened it, lifted one of the flaps, and put my hand upon the old paper which contained the statement about the old gold-plate. No; I did not. I put my hand on the place where it ought to have been; but it wasn't there.

'I must have put it in the other side,' I said to myself; and I opened the other lid.

Then I turned cold, and ran my hand here and there, wild-like, to stop at last with my mouth open, staring. The paper was gone! So was the money, and every article of value that I had hoarded up.

For a few minutes I was too much stunned even to think; and when at last I could get my brain to work, I sat there, feeling a poor, broken, weak old man, and I covered my face with my hands and cried like a child.

'To think of it!' I groaned at length—'him so handsome and so young—him whom I'd always felt so proud of—proud as if he'd been my own son. Why, it would break his father's heart if he knew. It's that cursed woman's doing,' I cried savagely. 'She turned his head, or he'd never have done such a cruel, base, bad act as to rob a poor old man like me.' For I'd recollected lending Mr Barclay my keys, and I felt that sooner than ask his father for money, he had taken what he could find, and gone. 'Let him!' I said savagely at last. 'But he needn't have stolen them. I'd have given him everything I'd got. I'd have sold out the hundred pounds I've got in the bank and lent him that. But he didn't know what he was doing, poor boy. That cursed woman has turned his brain.'

'Ah, well!' I said at last bitterly, 'it's my secret. Sir John shall never know. He trusted me with one, and now his son'— I stopped short there, for I recollected the paper, and fell all of a tremble, thinking of that gold plate, and that some one else knew of its hiding-place now; and I asked myself what I ought to do. For a long time I struggled; but at last I felt that, much as I wanted to hide Mr Barclay's cruelly mean act, I must not keep this thing a secret. 'It's my duty to tell my master,' I said at last, 'and I must.' So I went up to where Sir John was sitting alone, pretending to enjoy his wine, but looking very yellow and old and sunken of face. 'He's fretting about Master Barclay,' I said to myself, and I felt that I could not tell him that the lad had taken my little treasures, but that he must know about the paper, so I up and told him only this at once; and that's why he said I was an old fool, and that it was all my fault.

'Good heavens! you old fool!' he cried excitedly, 'what made you write such a paper? It was like telling all the world.'

'I thought it would be so shocking, Sir John, if we were both to die and the things were forgotten.'

'Shocking? Be a good job,' he cried. 'A man who has a lot of gold in his care is always miserable.—Taken out of your desk, you say. When?'

'Ah, that I can't tell, Sir John. It might have been done years ago, for aught I know.'

'And the old gold plate all stolen and melted down, and spent. Good heavens! Burdon; and

here have I been thinking you a trustworthy man. There; we must see to it at once.—I shan't rest till I know it is safe.'

It seemed to me then that he snatched at the chance of finding something to do to take his attention off his trouble, for when I asked him if I should get a bricklayer to come in, he turned upon me like a lion. 'Burdon,' he said, 'we'll get this job done, and then I shall have to make arrangements for you to go into an imbecile ward.'

'Very good, Sir John,' I said patiently.

'Very good!' he cried, laughing now. 'There; be off, and get together what tools you have, and as soon as the servants have gone to bed, we'll go and open the old cellar ourselves.'

FEMALE GOVERNMENT CLERKS IN AMERICA.

EVERY country has a certain favoured few whose only employer is 'Government,' the Ministry or Administration which for the time holds dominant power; but none can count so many women among these few as the United States. In the Treasury and Interior Departments, in Washington, are many hundreds of women performing the same clerical duties as their brethren do—copying or inditing letters, examining or adjusting claims, scrutinising and correcting returns of gaugers and tobacco inspectors, and keeping sets of books—whose salaries range from twelve to twenty-three pounds per month, some even receiving twenty-seven pounds.

When women were first appointed to these positions, during the closing years of the late civil war, it was looked upon as a temporary and rather rash experiment; they then did mechanical work, such as assorting and packaging the newly issued bonds; counting, recounting, and packaging the 'fractional currency,' as the paper money was called which was issued in lieu of silver to represent fractional parts of a dollar. Later, when this perishable circulating medium began to return to the Treasury—in a sadly mutilated condition—to women's nimble fingers was delegated the task of assorting and counting this mass of ragged, dirty, odoriferous 'money'—pieces of paper about one inch by two, with some of yet smaller dimensions.

Having once got a foothold in government work, woman little by little pushed herself farther and farther in, until now there are few, if any, branches of service where she is not represented. From all parts of the United States they have come, and all ranks of life are represented, so, of course, there are some odd specimens among them. In the earlier days, all these appointments were by political favour; consequently, some quite unlearned people crept in. One or two, to my knowledge, took writing lessons after they were in office, and for many weeks they used to come and ask me to 'back' their letters for them, their chirography and spelling being so very defective that they did not dare to entrust them to the post-office clerks.

Most of these women have some dependents—their fatherless children, their aged parents, or their younger brothers and sisters—who rely on them for support; very few are free to use all their money for themselves. But where they can

do so, they usually invest a little every year in real estate, bonds, or stocks, or in perfecting themselves in some attainment, music, art, language, or even medicine. One lady recently took her degree as M.D. after a long course of evening study; meantime, she faithfully attended to the duties pertaining to a very important desk. Some graduate to the stage, the concert-room, or lecture platform, and not a few of them are connected with the press. Sometimes—alas, there are so many spinsters in the United States—one marries and leaves the office; and when, by-and-by, she comes to see her former co-labourers and show them her baby, that young person excites almost a proprietary interest in the breast of every woman there; for clerks cannot be together in the same office for seven hours per diem, three hundred days in the year, without becoming quite intimate and strongly interested in the good or ill fortune of one another. Each is interested in the last letter which the others have had from 'home;' for Washington is really home to comparatively few of those who earn their bread there; tenure of office is so uncertain, that each one feels that at any hour he or she may be obliged to return to the northern, southern, or western town whence he or she came.

Office hours are the same in all branches of government service—from nine A.M. to four P.M., with an intermission of half an hour at noon for luncheon. This repast most of the clerks carry from home, as thirty minutes is scarcely long enough for one to go to a café. The vacations allowed are thirty days per annum—with pay—and the legal holidays—Christmas, New-Year's Day, Washington's birthday (February 22), and the 4th of July, when the national independence is celebrated over the land with much ringing of bells, firing of cannon, braying of brass bands, and burning of gunpowder in every form known to juvenile hearts; also May 30th, or Decoration Day, which is the day observed in memory of those who fell during the last war, when thousands of graves are strewn with flowers, and various services, more or less devotional in character, are conducted in the national cemeteries, those large enclosures where long rows of dead soldiers lie side by side, each with a simple headstone, telling who lies there; or, as is so often the case, bearing the pathetic inscription, 'Unknown.' The President also sets apart one day—usually the last Thursday in November—as a day of general thanksgiving for the peace and prosperity of the past twelvemonth.

All clerks are politicians. Politics is a component part of life in Washington; it is in the very air one breathes. Until a few years ago, all appointments were by political favour. If you had a near kinsman high up in official favour, you were pretty sure to get or retain your office, no matter what you might do, short of actual crime, and nothing was so much dreaded as a decided change in the administration. Now, all appointments are, by law, made under competitive examination, and favour is *supposed* to have nothing to do with it.

It often takes our naturalised citizens some time to become accustomed to having women set so nearly upon the same plane with the lords of creation; and I remember one young Irishman, a graduate of a Dublin college, and a surveyor by

profession, who, when appointed to a position in the Treasury department, was set to do certain mathematical work upon which were also employed two other men—a German and a Scotchman—and a lady. The computations were, owing to the nature of the work, to be done with great rapidity; but to insure perfect accuracy, each clerk's papers were re-computed by all the other three; and it chanced that the few errors the Irishman made were detected by the feminine computer, and this so hurt his pride, that he became really angry. 'Never mind,' said he excitedly one day; 'I'll find some mistakes in your papers, Miss—just see if I don't!'

Before she could reply, the Scotchman cried: 'Well, why don't you? That's what you're hired for. *We* find errors in her papers; why don't you?'

However, he soon became accustomed to the matter, and very soon ceased to care whether it were Mr or Miss who corrected his papers.

There are many clerks who know something, by experience, about other countries than the one in which they were born. Some of them have travelled before adversities have reduced them to working for their bread and butter; and others carefully economise for three or four years, in order that they may be able to afford a visit to England and the continent. Sometimes a windfall in the shape of a small legacy is utilised in the same way. One lady whom I knew received about six hundred pounds as her share of certain moneys which the government owed her grandfather for services during the Mexican war; and as soon as she got it, she went to one of her companions and said that she had determined to use this money by taking a trip abroad; adding: 'You know that I would be as helpless as a child in travelling alone, so I want you to go with me. I will put the money in your hands right off; and you can use it as if half of it was your very own, if you'll only go with me and take care of me. You are conversant with three languages, and I have but a little familiarity with French. You are accustomed to travelling alone, too; and I would feel as secure with you as I ever did with my husband.' And so on. But her friend, thinking it only a whim, begged her to give up the scheme and save the dollars for future use—for the day when she might lose her present position, or when illness might overtake her or her little daughter; and absolutely refused to aid her in squandering this small fortune.

But Mrs — was determined, and at last secured another lady to spend half her money for her. Weeks passed; and about four months after the two ladies had sailed, we were astonished to see Mrs — appear in the office alone. In spite of our surprised inquiries, we could for some time learn nothing as to the cause of this abrupt return; but by-and-by the other one came home and told her side of the story. She said that she had in her pocket all their letters of credit, their tickets, and all the loose coin they possessed; and that one morning, when they were in Venice, she had started out to go to early mass at a church some distance from their hotel; and that the gondolier had robbed her of everything she had; and then, giving her a little money, had rowed her to the railway station, and buying her a ticket for some point at a distance—if my

memory serves me right, it was Genoa—had put her aboard the train: that she was so frightened, that she did not know what to do; but when she reached her journey's end, had gone to some one in the place—either the consul or a clergyman, I forget which—and obtaining enough of a loan to take her to London, had proceeded directly thither, where she had acquaintances, and then, for the first time, bethought her to telegraph to her friend in Venice!

Of course, no one believed this romantic tale; but the truth was never known to a certainty; only, as the lawful owner of the funds had never had any settlement with her companion from the day they left New York, it was supposed that somehow the money had slipped through the other lady's fingers, and then, alarmed, she had run away, and concocted this pretty little romance about a timid maiden—with gray hair—and a wicked gondolier. It was better than any novel to the many who knew both the ladies, and it made quite an excitement in the usually humdrum life of government clerks.

There is a vast amount of *esprit de corps* among these fellow-workers. If one has a bit of good luck, it is told all over the office, as a matter of general rejoicing. If affliction comes, hearts and purses are quickly opened, even by those who may not be personally acquainted with the one in trouble. It is not often, however, that people show their appreciation of sympathy as did one Mrs B—. The day after her mother's funeral, she brought to her office-friends some small bouquets made up of the flowers which had lain upon the coffin. But, as it is the custom in some parts of the United States to remove the silver coffin plates just before interment, one need not be surprised at seeing the flowers passed around as a keepsake. In at least one house I know, the several coffin plates are neatly arranged on the parlour wall, as a bric-à-brac fancier hangs up cracked china.

PICTURES OF THE IMAGINATION.

THERE is, and there always must be, a great difference between 'that which is' and 'that which seems'—between the real and the ideal; and if this fact were more generally borne in mind, much disappointment would be prevented. In youth, pictures of the imagination are, as a rule, very vivid and glowing, and the anguish on discovering that 'things are not what they seem' is correspondingly great. Pecksniff confessed that in the days of childhood he thought 'pickled onions grew on trees, and that every elephant was born with an impregnable castle on his back.' Is it unreasonable to say that many of the ideas of youth are not less absurd? Take, for example, the average youth's imaginary picture of the 'splendid' life of a sailor. Nowadays, as we all know, comparatively few lads run away to sea—they prefer, even at a very early age, to dabble in literature and to speculate on the brilliant future of the 'literary calling;' but at one time—owing principally to the great popularity of Marryat's novels—this was quite common, and lads very soon discovered that the life of a sailor is

by no means so full of romance as their fancy painted.

Although everybody has had experiences of this sort, yet we continue to build those castles, and to paint those vivid mental pictures, for the simple reason that it is perfectly natural to do so. In like manner, everybody is addicted to drawing imaginary portraits—of picturing how such and such a man must look, in spite of an experience which tells us that those portraits will in all probability be totally unlike the original. It ought to be known by this time that the character or the personal appearance of an author cannot be judged from his writings, any more than the subject of those writings affords any clue to the circumstances under which they were written. Hogarth's poet indited an ode to riches while his wife was being dunned for the milk-score; and it is tolerably well known that Moore wrote *Lalla Rookh* in a cottage blocked up with snow, with an English winter howling around. After this, it is not surprising to learn that Tennyson has written to an admirer of his well-known poem, commencing, 'Break, break, break, on thy cold gray stones, O Sea,' saying that it was composed, not by the seashore, but 'made in a Lincolnshire lane at five o'clock in the morning.' Therefore, the old piece of advice, 'Never read the life of your literary hero,' is as full of significance now as ever it was; and it is because this injunction has been disregarded, that so many pictures of the imagination in connection with literary men have been destroyed. An author may indeed say of his 'literary executor'—as some one said of Lord Campbell—that he adds a new terror to death.

An American author, when a youth, was inexpressibly grieved to hear that the poet of whom he was then fond kept his hair very short, and wore the best fitting coat in New York. Popular imagination is apt to associate genius with an abundance of flowing locks and uncomfortable-looking cloaks; and it is doubtless owing to this reason that portraits of Tennyson never fail to give satisfaction. But, as a rule, photographs of eminent men are very disappointing—why, it would sometimes be difficult to say. Can it be, as some one has suggested, that all the bright, clever, handsome, and 'promising young men' never come to anything? Ladies are especially fond of drawing imaginary portraits of authors, actors, well-known divines, and professional beauties; and when they first see a photograph of any well-known personage, it is usually favoured with some honest though not flattering criticism. In the case of most other photographs, there is a surprising similarity of result, especially in the case of those of humorous writers and artists. It is naturally expected that there will be an air of jollity about such men; but most of them look as if they did not enjoy life, and even in the flesh many of them looked miserable.

Leech, according to an author who knew him, 'disappointed expectation in the way of comedy. He was very silent, and his air was generally one of settled gloom.' Artemus Ward always seemed unhappy; and Josh Billings, in the characteristic words of an American reporter, had the air of a man who had just seated himself on a tack. The living American humorists are equally disappointing. Mark Twain has been described as 'wearing

the injured look of a bad boy who has been pulled out of bed to see uncongenial company.' If the personal appearance of such men as these fails to realise expectation, it is no wonder that their photographs are disappointing.

Of late years, the practice of giving 'portraits' of eminent men in newspapers has enormously increased, until one can hardly pick up a copy of any provincial journal without seeing one or two specimens of this kind of illustration. Unfortunately, however, the problem of reproducing photographs to work on certain kinds of fast printing-machines has not yet been satisfactorily solved; and consequently, many well-known men have been anything but flattered by some of these crude attempts at illustration. Not long ago, a popular dramatist humorously threatened to bring an action for libel against a newspaper which had printed what he called a 'beastly caricature' of himself. Mr John Augustus O'Shea, too, once remarked of a certain newspaper 'portrait' of himself, that the 'likeness in a fog' might save him from arrest if 'wanted,' but there was a risk of his American agent billing him as a 'coloured gemman!' And now, an American authoress has implored all her acquaintances who value their reputation to refuse to lend a photograph for the purpose of newspaper illustration. After making due allowance for exaggeration, there can be no doubt that many newspaper portraits are decidedly bad, and that they do much to destroy imaginary portraits and to create false impressions.

Places, like men, are frequently very different from the imaginary pictures formed of them. Oscar Wilde confessed that he was 'disappointed in the Atlantic.' It was, he said, not nearly so grand as he had expected. If we are not mistaken, a popular journalist once expressed his indignation at the amount of 'gush' that had been written about the grandeur of Niagara. Almost every traveller, indeed, records that he was disappointed in the appearance of certain of the well-known places in the world, because they were so different from what he had expected. Who has not experienced this feeling with regard to the sights in our own land? It is a singular fact, too, that the scenes of our youth, when visited after an absence of ten or twenty years, are generally disappointing, and invariably very different from the mental pictures we retain of them, even if no alterations have been made. Streets seem shorter, fields smaller, walls turn out to be much lower than we had supposed, and, in short, everything we see strikes us as being on a more insignificant scale now than when we were young. This can be easily accounted for, owing to the fact that the mental pictures formed in our childhood—when a five-foot wall, say, would appear rather high—have not become larger as we grow older. At thirty, a five-foot wall, as a rule, appears comparatively low; hence the disparity between the mental pictures and the evidence of our senses.

Charles James Yellowplush, in describing his adventures in 'foring parts,' said he never saw a single Frenchman swallow a frog, which he had been 'led to beleave was their reglar though beastly custom.' Many ideas such as this are nothing more than popular pictures of the imagination, just as it has long since been discovered that the 'picturesque' red-man of Fenimore Cooper was a purely fictitious personage. Dick

Deadeye qualified Longfellow's well-known assertion by saying that 'things are *seldom* what they seem;' but taking all things into consideration, it may be doubted whether the qualification is necessary.

A HANDY SCRAP-BOOK.

A correspondent of an educational newspaper believes he has found a good thing in the way of a serviceable scrap-book. Instead of leaves on which to paste the scraps, it has pockets or envelopes, into which he drops his cuttings from newspapers or magazines. By this simple method he is saved the time and trouble of pasting. These cuttings are classified according to subjects; all the scraps on a given subject, or class of subjects, are put into the same envelope. The title of the subject is written on the envelope containing it, and the name is also entered in the index in front of the book. When information is wanted upon any subject, all the scraps will be found in one place, and can be easily removed, consulted, and replaced at pleasure. Besides printed scraps, notes, one's own thoughts reduced to writing, lectures, or addresses, can thus be filed, and a record of the time and place of delivery written on the outside of the envelope. Busy, practical men, literary men, teachers, or clergymen can in this way keep their scraps of information in readiness for future consultation. An ingenious student of natural history has perhaps an improvement upon this method. Instead of a scrap-book with pockets or envelopes, he utilises a row of pasteboard boxes made to resemble books, upon the backs of which the contents, 'Biography,' 'Natural History,' &c., are inscribed. Both of the foregoing methods of scrap-keeping have been tested and found practically useful, and by either of them an article, when useless or finally disposed of, can be withdrawn and destroyed.

J E T S A M.

THE warm wave feels cool evening's breath;
White foam-flakes with its blue commingle;
Soul-saddened in the hush of death,
The tide lays gently on the shingle
A burden which it cherisheth.

The living locks of brown sea-drift
With the dead locks of gold are weaving;
The clinging garments fall and lift
Responsive to the billows' heaving;
Low at my feet they stretch their gift.

O first-born love with death for bride!
O starless night with far to-morrow!
O wailings of a funeral tide
Filled with the endless Ocean's sorrow,
And by its beauty sanctified!

Dear nameless daughter of the deep,
Then seen, then loved, us nought shall sever!
Outwatch with me this life of sleep
Till death's morn join our souls for ever,
And I my plighted troth will keep.

HUMOURS OF A GOVERNMENT OFFICE.

THE annoyances so often complained of by those whose evil genius has driven them into dealings with government departments; the formalities, the endless delays, the crooked ways which prevail in the temples dedicated to the worship of Red-tape, are commonly supposed to be part of a cunningly devised system invented by over-paid and overbearing officials, whose one object is to embarrass, humiliate, and embitter the lives of such of Her Majesty's lieges as are not fortunate enough to belong to their own haughty and exclusive caste. If this be so, it may be some consolation to the said lieges to learn that the authors of the system are also its victims—that the wielders of the red-tape scourge do not spare their own backs. Let us examine a few of the stripes it inflicts.

A clerk wants a hat-peg fixed up in his room. He puts forward a requisition, which, after being initialed by a number of officials—initialing is the one great feature in the work of a government department—finally reaches the individual who directs the workmen. After a decent interval, the executive arrive, generally in the plural number, and proceed to survey the room in which operations are to be undertaken, and to fix on a site for the hat-peg. It might be thought that the clerk who set the ball a-rolling would be a fairly good judge on this last point; but it would be very irregular to consult him. The executive, having 'earned a night's repose,' depart; and soon after—perhaps in less than a week even—another workman appears on the scene with a selection of hammers, screws, nails, planes, and—if he happens to remember them—hat-pegs. Having fixed on a site of his own—different from that chosen by his predecessors, and of course different from that desired by the clerk—he proceeds to fix up the peg, and sometimes completes the work in a day.

The position of the peg, though eminently artistic, is inconvenient; in fact, it prevents the closing of the room-door. He does not deny this

when it is pointed out to him; he merely remarks that he cannot exceed his instructions, which were to put up a hat-peg, and that to take one down requires a fresh set of instructions. In a few weeks, after the inevitable requisition, these are given; more workmen arrive, the offending peg is removed, and the door is closed once again. If the second requisition is cunningly worded, the second set of instructions may include the fixing up of the peg in a more convenient position; but to negotiate this successfully requires great tact and experience.

Does a clerk want a handle taken from an ordinary door and fixed on a baize-covered door? After the usual formalities, the horny-handed son of toil puts in an appearance, unscrews the handle, throws it in a corner of the room, and prepares to go. On being remonstrated with for leaving undone half of what is required, the nature of which is explained to him, he states that he has carried out his instructions, and expresses a mild surprise that he, a specialist in ordinary doors, should be expected to do work which appertains to the 'green-baize-door department man.'

Government servants, however, are capable of great despatch when put on their mettle. This was illustrated some years ago, when a dynamite explosion broke the glass in the windows of a public office and several neighbouring houses. The men sent to repair the damage in the government building, feeling that something more than ordinary was expected of them, displayed the most feverish activity, took out sashes, marked them with cabalistic figures, put them back, took measurements—apparently for new carpets—sawed up blocks of wood, and generally manifested their appreciation of the fact that it was an occasion on which England expected every man to do his duty. The result was that in a week all the windows were completely boarded up preparatory to being glazed. It is true that on the evening of the day following the explosion, a large private institution next door, which had been equally damaged, had regained the *status quo* as regards

its windows; but this result had probably been achieved in a most irregular and unofficial manner, very revolting to the instincts of the order-loving civil servant.

Order, which is heaven's first law, is also the first law in a government office. Nothing is ever rushed through. If a clerk thinks his rank entitles him to better candles than those served out to him—candles, the quality of which depends on the rank of the user, are much affected in the civil service, probably because they are worse and dearer than gas or oil—he gets his principal to ask the office-keeper to request the Under-secretary of State to pray the Under-secretary of the Board of Works to move the Board to grant the Secretary of State permission to authorise the Under-secretary to direct the office-keeper to issue the superior kind of candles. By the time the office-keeper gets the directions, the dark evenings are perhaps past; next winter probably another maker's candles are used, and as he adopts a different classification of his goods, all the correspondence and requisitions have not much practical result, except to make a precedent.

Precedent governs everything, especially correspondence. The addressing and wording of letters are subjects of deep interest, and are the causes of many searchings of heart. If a Secretary of State is a civilian, is the writer directed by Secretary Mr Jones or by Mr Secretary Jones? If a military man, is he General Secretary Robinson or Secretary General Robinson? Is a Board to be requested to do a thing, or only moved to consider whether it should give directions to have it done? Happy and respected is the man to whom such questions present no difficulties.

Daring spirits, scorning precedent, sometimes strike out new and highly original lines. An officer in the army having preferred a request on some subject, the official who brought it to the notice of the Commander-in-chief asked if it might be granted, and was told 'certainly not.' It is said the official drafted the following letter, which certainly had the merit of brevity: 'In reply to your letter dated —, I am directed by the Commander-in-chief to inform you that certainly not.' Such men, however, are very exceptional, and their originality is not encouraged.

Most Crown servants are great sticklers for form, though whether, in adhering strictly to system, they do not occasionally try to poke a little fun at it, is a doubtful question. This culpable tendency may perhaps be detected in the following case. When a certain tax is paid one year and not the next, the clerk who keeps the record must enter opposite the name of the taxed one the reason for the discontinuance. One of Her Majesty's subjects having one year paid his taxes and shortly afterwards the debt of nature, naturally failed to pay the former the succeeding year. The cause—'Dead'—was entered in the proper column; but as the formality of crossing through his name was overlooked, a reason had to be given for non-payment on the third year, and the clerk gave a very cogent one—'Still dead.'

The issue of pay to civil servants has exercised the ingenuity of generations of officials. All conceivable systems have been tried, except issuing one-twelfth of the annual salary at the end of each month. In one of the largest departments, a very

humorous system is in force. Suppose a clerk has a salary of two hundred and sixty pounds a year—one month he gets twenty pounds, next month the same, and the third month twenty-five pounds. This makes a quarter of two hundred and sixty pounds, and completes a quarter's pay. He begins the next quarter with twenty pounds, and goes on as before. This stoppage from his pay during two months, to be added to the third month's allowance, may be supposed to spring from a paternal solicitude for his welfare, as it gives him a larger amount when it is wanted to meet the landlord's and other claims on quarter-day; but as a large majority in the office in question are bachelors who live in lodgings, and for whom quarter-day has therefore no terrors, the wisdom of the arrangement is not very patent.

The statement that the clerk gets twenty-five pounds the third month requires modification. He would get it if, like others, he was trusted to pay his income-tax at the end of the official year; but the authorities prefer to put him out of temptation's way, and so deduct a quarter of his income-tax from each third month's pay. And, as a wholesome moral discipline, they calculate the tax on the whole of his income; but, at the end of the year, they return, if he claims it, the tax on the one hundred and twenty pounds which is exempt in the case of salaries under four hundred pounds a year. An artistic finish is given to the joke by making him give a receipt for his pay several days before he gets it.

The sharp practice displayed in the collection of this tax is sometimes returned in kind. A clerk who had exhausted his ordinary leave, took 'French' leave for a day, for which delinquency, notwithstanding his protests, he was docked of a day's pay. At the end of the year he claimed the return of the income tax, not on that amount which was exempt, but on the whole of his salary, on the ground that the stoppage of a day's pay had brought his income below the minimum chargeable with the tax. His claim was at first refused; but he appealed to the Income Duty Commissioners, by whom it was allowed. As the tax at that time was very high, he gained much more than he had lost by the docking of his pay, and his day's leave besides. The triumph over constituted authority must also have counted for something, for a civil servant, too, is human.

A colleague who stayed away without leave was less fortunate. On being called upon for an explanation, he could think of no better excuse than that he had gone to see some friends, and had forgotten that he was in business. As this forgetfulness of a not unimportant fact in his life had held sway over him for about a week, it was considered as well to make the fact correspond with the long-standing illusion, and when, as usually happens in such cases, he suddenly discovered in himself a strong desire to cast off official fetters, he was graciously permitted to do so. As the records show, he 'retired voluntarily.'

Leave beyond the ordinary term does not, however, as a rule entail these dire consequences. It is nearly always granted, within certain limits, in cases of sickness or of domestic bereavement

or other misfortune. What constitutes domestic misfortune is, however, a difficult question. A man who had just lost his mother, applied for special leave to enable him to attend her funeral and make some arrangements as to the future of his young and orphaned brothers and sisters. This was refused, and he was obliged to take leave without pay. Next year, having exhausted his ordinary leave, he applied for leave without pay, as he was about to get married and experienced a not unnatural desire for a short honeymoon. Much to his surprise, he was granted leave *with pay*. As the same Board had dealt with both cases, it seems that to the official mind the death of a mother is a less grievous domestic calamity than the taking unto one's self a wife.

Not so, however, the death of a father. A certain knight of the quill once upon a time asked for a week's leave that he might go to bury his father. This was readily granted; and so much sympathy was expressed by his chief, that he thought it a good opportunity to borrow some filthy lucre from his sympathiser. A gallant admiral who had to be consulted as to the leave was also sympathetic, and he too bled to the tune of some 'paltry pounds.' The orphan then took his departure. A day or two afterwards, there arrived a visitor, who wished to see Mr X the orphan. Mr X's chief explained that he wasn't to be seen—in fact he had gone away to bury his father. 'But,' said the stranger, 'I am his father!'—'Well,' replied the official—a man of few words—I don't know anything about Mr X's private affairs; I only know he is gone to bury you.'

At the end of the week of mourning, Mr X returned, looking very disconsolate. When asked by his chief how he fared, he pulled a very long face, and said that he had had 'the melancholy satisfaction of seeing the last rites properly and decently performed,' and so on, adding, that of course he felt very deeply on the subject, but that no doubt time would lighten the load of his affliction. 'Ah!' replied the other, 'I can sympathise with you. I lost my father when I was a young man. When you lose your father, you lose your best friend. I hadn't the pleasure of your poor father's acquaintance during his lifetime; but he called here a few days after his death, and I had a short conversation with him. Now, this was most irregular; and my object in sending for you was this—when next the poor old gentleman dies, do, if you possibly can, arrange to have him buried and to be back here to meet him in case he calls again. That's all.—Good-morning.'

Exit Mr X, not perhaps an outwardly sadder, but certainly a much wiser man.

In some departments, sick-leave counts in diminution of ordinary leave; and it is observed that in these departments the employees are much healthier than in those where it does not so count. This rule has another curious effect: it tends to make the end of the year—when the ordinary leave has been taken, and is therefore safe from deductions—much more unhealthy than the beginning.

That 'want of pence which vexes public men' appears to be chronic with a large number of servants of the Crown, and sometimes places them in awkward and ludicrous situations. A gentle-

man who did not affect the 'ready-cash' principle in his monetary transactions, having caught sight of a creditor making for his room, and finding it inconvenient to grant him an interview, gave a few hurried directions to his colleague as to how to receive the unwelcome visitor, and then took up a strategic position under his own desk. On the arrival of the enemy, the said colleague, being either a conscientious man or an unready man or perhaps wishing to have a little joke at his friend's expense, failed to carry out his instructions, and merely remarking that his friend was 'somewhere about,' and would no doubt be back presently, requested the newcomer to take a seat. He took one—that just vacated by the absconding debtor, at the very desk under which he was hiding.

Now, the unfortunate fugitive was a man of a corpulent habit, and very dignified withal; the day was very hot, the floor was very dusty, and his prison was a very tight fit. The slightest movement would betray him. His position was neither dignified nor comfortable; and he could only console himself with the reflection that time was on his side. The tradesman, he reflected, must go at last; and if he could only hold out till then, all would yet be well. But the cup of his misfortunes was not yet quite full. When he heard his faithless friend rise from his place and leave the room, leaving the enemy free to wander at will about the place inspecting the furniture and otherwise gratifying his curiosity, he gave himself up for lost. The enemy, however, did not avail himself of his opportunity. But if his bump of curiosity was imperfectly developed, he had a wonderful organ of patience. He waited nearly an hour—more nearly a fortnight, it seemed to his victim—until this quality was exhausted, and at last he left. The released prisoner, with cramp in his limbs and rage in his heart, covered with dust and humiliation, rushed through another door to find and visit with condign punishment the miserable wretch who had betrayed him. But his desire for vengeance was his undoing. Turning a corner, he ran into the arms—of his creditor! He had suffered in vain.

THIS MORTAL COIL.

CHAPTER V.—ELECTIVE AFFINITIES.

THE Girton governess of these latter days stands on a very different footing indeed in the family from the forty-pound-a-year-and-all-found young person who instructed youth as a final bid for life in the last generation. She ranks, in fact, in the unwritten table of precedence with the tutor who has been a university man; and, as the outward and visible sign of her superior position, she dines with the rest of the household at seven-thirty, instead of taking an early dinner in the school-room with her junior pupils off hashed mutton and rice-pudding at half-past one. Elsie Chaloner had been a Girton girl. She was an orphan, left with little in the world but her brains and her good looks to found her fortune upon; and she had wisely invested her whole small capital in getting herself an education which would enable

her to earn herself in after-life a moderate livelihood. In the family at Whitestrand, where she had lately come, she lived far more like a friend than a governess: the difference in years between herself and Winifred was not extreme; and the two girls, taking a fancy to one another from the very first, became companions at once, so intimate together that Elsie could hardly with an effort now and again bring herself to exert a little brief authority over the minor details of Winifred's conduct. And, indeed, the modern governess, though still debarred the possession of a heart, is now no longer exactly expected to prove herself in everything a moral dragon: she is permitted to recognise the existence of human instincts in the world we inhabit, and not even forbidden to concede at times the abstract possibility that either she or her pupils might conceivably get married to an eligible person, should the eligible person at the right moment chance to present himself, with the customary credentials as to position and prospects.

'I wonder, Elsie,' Winifred said after lunch, 'whether your cousin will really come up this afternoon? Perhaps he won't now, after that dreadful wetting. I daresay, as he only came down in the yawl, he hasn't got another suit of clothes with him. I shouldn't be surprised if he had to go to bed at the inn, as Mr Relf does, while they dry his things for him by the kitchen fire! Mr Relf never brings more, they say, than his one blue jersey.'

'That's not like Hugh,' Elsie answered confidently. 'Hugh wouldn't go anywhere, by sea or land, without proper clothes for every possible civilised contingency. He's not a fop, you know—he's a man all over—but he dresses nicely and appropriately always. You should just see him in evening clothes; he's simply beautiful then. They suit him splendidly.'

'So I should think, dear,' Winifred answered with warmth. 'I wonder, Elsie, whether papa and mamma will like your cousin?'

'It's awfully good of you, darling, to think so much of what sort of reception my cousin gets,' Elsie replied with a kiss, in perfect innocence. (Winifred blushed faintly.) 'But, of course, your papa and mamma are sure to like him. Everybody always does like Hugh. There's something winning about him that insures success. He's a universal favourite, wherever he goes. He's so clever and so nice, and so kind and so sympathetic. I never met anybody else so sympathetic as Hugh. He knows exactly beforehand how one feels about everything, and makes allowances so cordially for all one's little private sentiments. I suppose that's the poetic temperament in him. Poetry must mean at bottom, I should think, keen insight into the emotions of others.'

'But not always power of responding sympathetically to those emotions.—Look, for example, at such a case as Goethe's,' a clear voice said from the other side of the hedge. They were walking along, as they often walked, with arms clasped round one another's waists, just inside the grounds, close to the footpath that led across the fields; and only a high fence of privet and dog-rose separated their confidences from the ear of the fortuitous public on the adjoining footpath.

So Hugh had come up, unawares from behind, and overheard their confidential chit-chat! How far back had he overheard? Elsie wondered to herself. If he had caught it all, she would be so ashamed of herself!

'Hugh!' she cried, running on to the little wicket gate to meet him. 'I'm so glad you've come. It's delightful to see you.—But oh, you must have thought us two dreadful little sillies.—How much of our conversation did you catch, I wonder?'

'Only the last sentence,' Hugh answered lightly, taking both her hands in his and kissing her a quiet cousinly kiss on her smooth broad forehead. 'Just that about poetry meaning keen insight into the emotions of others; so, if you were saying any ill about me, my child, or bearing false witness against your neighbour, you may rest assured at any rate that I didn't hear it.—Good-morning, Miss Meysey. I'm recovered, you see; dried and clothed and in my right mind—at least, I hope so. I trust the hat is the same also?'

Winifred held out a timid small hand. 'It's all right, thank you,' she said, with a sudden flush; 'but I shall never, never wear it again, for all that. I couldn't bear to. I don't think you ought to have risked your life for so very little.'

'A life's nothing where a lady's concerned,' Hugh answered airily with a mock bow. 'But indeed you give me credit for too much gallantry. My life was not in question at all; I only risked a delightful bath, which was somewhat impeded by an unnecessarily heavy and awkward bathing-dress.—What a sweet place this is, Elsie; so flowery and bowery, when you get inside it. The little lane with the roses overhead seems created after designs by Birket Foster. From outside, I confess, to a casual observer the first glimpse of East Anglian scenery is by no means reassuring.'

They strolled up slowly together to the Hall door, where the senior branches were seated on the lawn, under the shade of the one big spreading lime-tree, enjoying the delicious coolness of the breeze as it blew in fresh from the open ocean. Elsie wondered how Hugh and the Squire would get on together; but her wonder indeed was little needed; for Hugh, as she had said, always got on admirably with everybody everywhere. He had a way of attacking people instinctively on their strong point; and in ten minutes, he and the Squire were fast friends, united by firm ties of common loves and common animosities. They were both Oxford men—at whatever yawning interval of time, that friendly link forms always a solid bond of union between youth and age; and both had been at the same college, Oriel. 'I daresay you know my old rooms,' the Squire observed with a meditative sigh. 'They looked out over Fellows' Quad, and had a rhyming Latin hexameter on a pane of stained glass in one of the bay windows.'

'I know them well,' Hugh answered, with a rising smile of genuine pleasure—for he loved Oxford with a love passing the love of her ordinary children. 'A friend of mine had them in my time. And I remember the line: "Oxoniam quare venisti præmeditari." An excellent leonine, as leonines go, though limp in its quantity.—Do

you know, I fell in love with that pane so greatly, that I had a wire framework made to put over it, for fear some fellows should smash it some night, flinging about oranges at a noisy wine-party.'

From Oxford, they soon got off upon Suffolk, and the encroachment of the sea, and the blown sands; and then the Squire insisted upon taking Hugh for a *tour du propriétaire* round the whole estate, with running comments upon the wasting of the foreshore and the abominable remissness of the Board of Admiralty in not erecting proper groynes to protect the interests of coast-wise proprietors. Hugh listened to it all with his grave face of profound sympathy and lively interest, putting in from time to time an acquiescent remark confirmatory of the wickedness of government officials in general, and of the delinquent Board of Admiralty in particular.

'Æolian sands!' he said once, with a lingering cadence, rolling the words on his tongue, as the Squire paused by the big poplar of that morning's adventure to point him out the blown dunes on the opposite shore—'Æolian sands! Is that what they call them? How very poetical! What a lovely word to put in a triolet! Æolian—just the very thing of all others to go on all-fours with an adjective like Tmolian!—So it swallowed up forty acres of prime salt-marsh pasture—did it, really? That must have been a very serious loss indeed. Forty acres of prime salt-marsh! I suppose it was the sort of land covered with tall rank reedy grasses, where you feed those magnificent rough-coated, long-horned, Highland-looking cattle we saw this morning? Splendid beasts: most picturesque and regal. "Bulls that walk the pastures in kingly-flashing coats," George Meredith would call them. We passed a lot of them as we cruised up stream to-day to Whitestrands.—And the sand has absolutely overwhelmed and wasted it all? Dear me! dear me! What a terrible calamity! It was the Admiralty's fault! Might make a capital article out of that to bully the government in the *Morning Telephone*.'

'If you did, my dear sir,' the Squire said warmly with an appreciative nod, 'you'd earn the deepest gratitude of every owner of property in the county of Suffolk, and indeed along the whole neglected East Coast.—The way we've been treated and abused, I assure you, has been just scandalous—simply scandalous. Governments, buff or blue, have all alike behaved to us with incredible levity. When the present disgraceful administration, for example, came into power'—

Hugh never heard the remainder of that impassioned harangue, long since delivered with profound gusto on a dozen distinct election platforms. He was dimly aware of the Squire's voice, pouring forth denunciation of the powers that be in strident tones and measured sentences; but he didn't listen; his soul was occupied in two other far more congenial pursuits: one of them, watching Elsie and Winifred with Mrs Meysey; the other, trying to find a practicable use for Æolian sands in connection with his latest projected heroic poem on the Burial of Alaric. Æolian; dashes: Tmolian; abashes: not a bad substratum, that, he flattered himself, for the thunderous lilt of his opening stanza.

It was not till the close of the afternoon, however, that he could snatch a few seconds alone with Elsie. They wandered off by themselves then, near the water's edge, among the thick shrubbery; and Hugh, sitting down in a retired spot under the lee of a sheltering group of guelder-roses, took his pretty cousin's hands for a moment in his own, and looking down into her great dark eyes with a fond look, cried laughingly: 'O Elsie, Elsie, this is just what I've been longing for all day long. I thought I should never manage to get away from that amiable old bore, with his encroachments and his mandamuses, and his groynes and his interlocutors. As far as I could understand him, he wants to get the Board of Admiralty, or the Court of Chancery, or somebody else high up in station, to issue instructions to the east wind not to blow Æolian sands in future over his sacred property. It's too grotesque: quite, quite too laughable. He's trying to bring an action for trespass against the German Ocean.'

Will ye bridle the deep sea with reins? will ye chasten
the high sea with rods?

Will ye take her to chain her with chains who is
older than all ye gods?

Or will you get an injunction against her in due form on stamped paper from the Lord Chief-justice of England? Canute tried it on, and found it a failure. And all the time, while the good old soul was moaning and droning about his drowned land, there was I, just sighing and groaning to get away to a convenient corner with a pretty little cousin of mine with whom I had urgent private affairs of my own to settle.—My dear Elsie, Suffolk agrees with you. You're looking this moment simply charming.'

'It's your own fault, Hugh,' Elsie answered with a blush, never heeding overtly his last strictly personal observation. 'You shouldn't make yourself so universally delightful. I'm sure I thought, by the way you talked with him, you were absolutely absorbed in the wasting of the cliff, and personally affronted by the aggressive east wind. I was just beginning to get quite jealous of the encroachments.—For you know, Hugh, it's such a real pleasure to me always to see you.'

She spoke tenderly, with the innocent openness of old acquaintance; and Hugh, still holding her hand in his own, leaned forward with admiration in his sad dark eyes, and put out his face close to hers, as he had always done since they were children together. 'One kiss, Elsie,' he said persuasively.—'Quick, my child; we may have no other chance. Those dreadful old bores will stick to us like leeches. "Gather ye roses while you may: Old Time is still a-flying."'

Elsie drew back her face half in alarm. 'No, no, Hugh,' she cried, struggling with him for a second. 'We're both growing too old for such nonsense now. Remember, we've ceased long ago to be children.'

'But as a cousin, Elsie,' Hugh said with a wistful look that belied his words.

Elsie preferred in her own heart to be kissed by Hugh on different grounds; but she did not say so. She held up her face, however, with a rather bad grace, and Hugh pressed it to his own tenderly. 'That's paradise, my dear,' he

murmured low, looking deep into her beautiful liquid eyes.

'O son of my uncle, that was paradise indeed; but that was not like a cousin,' she answered with a faint attempt to echo his playfulness, as she withdrew, blushing.

Hugh laughed, and glanced idly round him with a merry look at the dancing water. 'You may call it what you like,' he whispered with a deep gaze into her big dark pupils. 'I don't care in what capacity on earth you consider yourself kissed, so long as you still permit me to kiss you.'

For ten minutes they sat there talking—saying those thousand-and-one sweet empty things that young people say to one another under such circumstances—have not we all been young, and do not we all well know them?—and then Elsie rose with a sigh of regret. 'I think,' she said, 'we mustn't stop here alone any longer; perhaps Mrs Meysey wouldn't like it.'

'Oh, bother Mrs Meysey!' Hugh cried, with an angry sideward toss of his head. 'These old people are a terrible nuisance in the world. I wish we could get a law passed by a triumphant majority that at forty everybody was to be promptly throttled, or at least transported. There'd be some hope of a little peace and enjoyment in the world then.'

'Oh, but, Hugh, Mrs Meysey's just kindness itself, and I know she'll let you come and see me ever so often. She said at lunch I might go out on the water or anywhere I liked, whenever I chose, any time with my cousin.'

'A very sensible, reasonable, intelligent old lady,' Hugh answered approvingly, with a mollified nod. 'I wish they were all as wise in their generation. The profession of chaperon, like most others, has been overdone, and would be all the better now for a short turn of judicious thinning.—But Elsie, you've told them I was a cousin, I see. That's quite right. Have you explained to them in detail the precise remoteness of our actual relationship?'

Elsie's lip quivered visibly. 'No, Hugh,' she answered. 'But why? Does it matter?'

'Not at all—not at all. Very much the contrary. I'm glad you didn't. It's better so. If I were you, my child, I think, do you know, I'd allow them to believe, in a quiet sort of way—unless, of course, they ask you point-blank, that you and I are first-cousins. It facilitates social intercourse considerably. Cousinhood's such a jolly indefinite thing, one may as well enjoy as long as possible the full benefit of its charming vagueness.'

'But Hugh, is it right? Do you think I ought to?—I mean, oughtn't I to let them know at once, just for that very reason, how slight the relationship really is between us?'

'The relationship is *not* slight,' Hugh answered with warmth, darting an eloquent glance deep down into her eyes. 'The relationship's a great deal closer, indeed, than if it were a much nearer one.—That may be paradox, but it's none the less true, for all that.—Still, it's no use arguing a point of casuistry with a real live Girtton girl. You know as much about ethics as I do, and a great deal more into the bargain. Only, a cousin's a cousin anyhow; and I for my part wouldn't go out of my way to descend gratui-

tously into minute genealogical particulars of once, twice, thrice, or ten times removed, out of pure puritanism. These questions of pedigree are always tedious. What subsists all through is the individual fact that I'm Hugh, and you're Elsie, and that I love you dearly—of course with a purely cousinly degree of devotion.'

'Hugh, you needn't always flourish that limitation in my face, like a broomstick.'

'Caution, my dear child—mere ingrained caution—the solitary resource of poverty and wisdom. What's the good of loving you dearly on any other grounds, I should like to know, as long as poetry, divine poetry, remains a perfect drug in the publishing market? A man and a girl can't live on bread and cheese and the domestic affections, can they, Elsie? Very well, then, for the present we are both free. If ever circumstances should turn out differently'—The remainder of that sentence assumed a form inexpressible by the resources of printer's ink, even with the aid of a phonetic spelling.

When they turned aside from the guelder-roses at last with crimson faces, they strolled side by side up to the house once more, talking about the weather or some equally commonplace and uninteresting subject, and joined the Meyseys under the big tree. The Squire had disappeared, and Winifred came out to meet them on the path. 'Mamma says, Mr Massinger,' she began timidly, 'we're going a little picnic all by ourselves on the river to-morrow—up among the sandhills papa was showing you. They're a delicious place to picnic in, the sandhills; and mamma thinks perhaps you wouldn't mind coming to join us, and bringing your friend the artist with you. But I daresay you won't care to come: there'll be only ourselves—just a family party.'

'My tastes are catholic,' Hugh answered jauntily. 'I love all innocent amusements—and most wicked ones. There's nothing on earth I should enjoy as much as a picnic in the sandhills.—You'll be coming too, of course, won't you, Elsie?—Very well, then. I'll bring Relf, and the *Mud-Turtle* to boot. I know he wants to go mud-painting himself. He may as well take us all up in a body.'

'We shall do nothing, you know,' Winifred cried apologetically. 'We shall only just sit on the sandhills and talk, or pick yellow horned-poppies, and throw stones into the sea, and behave ourselves generally like a pack of idlers.'

'That'll exactly suit me,' Hugh replied with a smile. 'My most marked characteristics are indolence and the practice of the Christian virtues. I hate the idea that when people invite their friends to a feast they're bound to do something or other definite to amuse them. It's an insult to one's intelligence; it's degrading one to the level of innocent childhood, which has to be kept engaged with Blindman's Buff and an unlimited supply of Everton toffee, for fear it should bore itself with its own inanity. On that ground, I consider music and games at suburban parties the resource of incompetence. Sensible people find enough to amuse them in one another's society, without playing dumb crambo or asking riddles. Relf and I will find more than enough, I'm sure, to-morrow in yours and Elsie's.'

He shook hands with them all round and raised his hat in farewell with that inimitable grace which was Hugh Massinger's peculiar property. When he left the Hall that afternoon, he left four separate conquests behind him. The Squire thought this London newspaper fellow was a most sensible, right-minded, intelligent young man, with a head on his shoulders, and a complete comprehension of the rights and wrongs of the intricate riparian proprietors' question. Mrs Meysey thought Elsie's cousin was most polite and attentive, as well as an extremely high-principled and excellent person. (Ladies of a certain age are always strong on the matter of principles, which they discuss as though they were a definitely measurable quantity, like money or weight or degrees Fahrenheit.) Winifred thought Mr Massinger was a born poet, and oh, so nice and kind and appreciative. Elsie thought dear darling Hugh was just the same good, sweet, sympathetic old friend and ally and comforter as ever. And they all four united in thinking he was very handsome, very clever, very brilliant, and very delightful.

As for Hugh, he thought to himself, as he sauntered back by the rose-bordered lane to the village inn, that the Squire was a most portentous and heavy old nuisance; that Mrs Wyville Meysey was a comic old creature; that Elsie was really a most charming girl; and that Winifred, in spite of her bread-and-butter blushes, wasn't half bad, after all—for an heiress.

The heiress is apt to be plain and forbidding. She is not fair to outward view, as many maidens be. Her beauty has solid, not to say strictly metallic qualities, and resides principally in a safe at her banker's. To have tracked down an heiress who was also pretty was indeed, Hugh felt, a valuable discovery.

When he reached the inn, he found Warren Relf just returned from a sketching expedition up the tidal flats. 'Well, Relf,' he cried, 'you see me triumphant. I've been reconnoitring Miss Meysey's outposts, with an ultimate view to possible siege operations. To judge by the first results of my reconnaissance, she seems a very decent sort of little girl in her own way. If sonnets will carry her by storm, I don't mind discharging a few cartloads of them from a hundred-ton-gun point-blank at her outworks. Most of them can be used again, of course, in case of need, in another campaign, if occasion offers.'

'And Miss Challoner?' Relf suggested, with some reproach in his tone. 'Was she there too? Have you seen her also?'

'Yes, Elsie was there,' the poet answered languidly, as he rang the bell for a glass of soda-water. 'Elsie was there, looking as charming and as piquante and as pretty as ever; and, by Jove! she's the cleverest and brightest and most amusing girl I ever met anywhere up and down in England. Though she's my own cousin, and it's me that says it, as oughtn't to say it, she's a credit to the family. I like Elsie. At times, I've almost half a mind, upon my soul, to fling prudence to the winds, and ask her to come and accept a share of my poor crust in my humble garret.—But it won't do, you know—it won't do. *Sine Cerere et Baccho, friget Venus*. Either I must make a fortune at a stroke, or

I must marry a girl with a fortune ready made to my hand already. Love in a cottage is all very well in its way, no doubt, with roses and eglantine—whatever eglantine may be—climbing round the windows; but love in a hovel—which is the plain prose of it in these hard times—can't be considered either pretty or poetical. Unless some Columbus of a critic, cruising through reams of minor verse, discovers my priceless worth some day, and divulges me to the world, there's no chance of my ever being able to afford anything so good and sweet as Elsie.—But the other one's a nice small girl of her sort too. I think for my part I shall alter and amend those quaint little verses of Blackie's a bit—make 'em run:

I can like a hundred women;
I can love a score;
Only with a heart's devotion
Worship three or four.'

Relf laughed merrily in spite of himself.

Massinger went on musing in an undertone: 'Not that I like the first and third lines as they stand, at all: a careful versifier would have insisted upon rhyming them. I should have made "devotion" chime in with "ocean" or "lotion," or "Goshen," or "emotion," or something of that sort, to polish it up a bit. There's very good business to be got out of "emotion," if you work it properly; but "ocean" comes in handy, too, down here at Whitestrand. I'll dress it up into a bit of verse this evening, I think, for Elsie or the other girl.—Winifred's her Christian name. Hard case, Winifred. "Been afraid" is only worthy of Browning, who'd perpetrate anything in the way of a rhyme to save himself trouble. Has a false Ingoldsby gallop of verse about it that I don't quite like. Winnie's comparatively easy, of course: you've got "skinny" and "finny," and "Minnie" and "spinney." But Winifred's a very hard case indeed. "Winnie" and "guinea" are good enough rhymes; but not quite new: they've been virtually done before by Rossetti, you know. But I doubt if I could ever consent to make love to a girl whose name's so utterly and atrociously unmanageable as plain Winifred.—Now, Mary—there's a name for you, if you like: with "fairy" and "airy," and "chary" and "vagary," and all sorts of other jolly old-world rhymes to go with it. Or if you want to be rural, you can bring in "dairy"—do the pretty-milkmaid business to perfection. But "Winifred"—"bin afraid"—the thing's impossible. It compels you to murder the English language. I wouldn't demean myself—or I think it ought to be by rights bemean myself—by writing verses to her with such a name as that.—I shall send them to Elsie, who, after all, deserves them more, and will be flattered with the attention into the bargain.'

At ten o'clock, he came out once more from his own room to the little parlour, where Warren Relf was seated 'cooking' a sky in one of his hasty seaside sketches. He had an envelope in his hand, and a hat on his head. 'Where are you off?' Relf asked carelessly.

'Oh, just to the post,' Hugh Massinger answered with a gay nod. 'I've finished my new batch of verses on the ocean—emotion—potion—devotion

theme, and I'm sending them off, all hot from the oven, to my cousin Elsie.—They're not bad in their way. I like them myself. I shall print them, I think, in next week's *Athenæum*.'

WALLOON TRADITIONS.

In these days of enlightenment, when people are loth to believe anything that they cannot see with their own eyes or explain by their own reasoning, it seems almost incredible that there should be a race of Europeans living so close to us as do the Walloons on the confines of Belgium and France, whose peasants believe that good and evil spirits actually exist in their midst, and that success or failure is entirely due to the agency of mountain spirits, dwarfs, and domestic goblins.

Some of the most popular of the Walloon superstitions relate to dwarfs. These are called *Halver-mannekens* (half-men) and *Kabouter-mannekens* (little fellows) by the Flemish, and are said to live in caves and subterranean places. Many tales are told of their skill and intelligence. The villagers of Hasselt, in Limburg, asserted that whenever war raged in the neighbourhood, numbers of dwarfs would appear; that they lived in a large cave in the woods, only coming into the village to obtain what they needed, and leaving it as soon as they were satisfied, without harming anything. When the dwarf-wives became old, they allowed their husbands to shut them up underground, after providing them with a loaf of bread; and the most diligent search by the keenest eyes could not discover where the earth had been disturbed.

In another village is a hill called Kabouterberg, in which there are many caverns; these are supposed to be the dwelling-places of some dwarfs who were in the service of a local miller. Whenever his grindstone needed whetting, he had only to put overnight a slice of bread-and-butter and a glass of beer upon it, and in the morning his stone was ready for use. The same reward was sufficient to procure the washing of the family's clothes.

In a neighbouring district, another miller, being unable to finish his task of sifting flour, left its completion till the next day, and on going away, accidentally dropped a piece of bread-and-butter. When he returned the next morning, he was amazed to find his work had been finished during the night, and the food had disappeared. Determined to prove that his sight and memory had not deceived him, he repeated the experiment, with a similar result. Being anxious to know who worked so well for such small pay, he hid, on the third night, behind some sacks, and about midnight saw a naked dwarf appear, who, after eating the food placed ready for him, set to work diligently. The miller pitied the industrious little fellow, who laboured away without any clothes to protect him from the cold; and on the following night, placed a warm suit of garments with the bread, butter, and beer; after which, the manikin never appeared without his clothes.

In the Pays Liégeois, legends relate that the household duties are performed by larger spirits, who answer to the German Kobold, the Scotch Brownie, and Milton's 'Lubber Fiend.' These are called Sotays, and are said to be more active,

industrious, and disinterested than any of the goblin race. The Sotay mows the hay; reaps, thrashes, and winnows the corn; cleans the stables and cowhouses; grooms the horses—for which he has an especial liking—and at daybreak everything is finished without any one knowing by whom or how it has been accomplished. The only recompense claimed is a bowl of milk—the 'cream-bowl duly set.'

Tradition relates that the Sotays are adepts in the art of metallurgy; and the peasants of Dinant—the place so famed in bygone days for the manufacture of pots and kettles—constantly tested the practical knowledge of these amateur tinkers. When a pot or saucepan was cracked or broken, if it was placed on the doorstep and the door quickly closed, it would be found mended in two minutes.

To each of the countless ruins in the provinces of Namur and Liège, popular credulity assigns a class of evil spirits, called by the Walloons *gâttes d'or* (golden goats), from the Walloon *gât*, a goat. These gnomes are said to guard a treasure hidden far down in a precipice underneath the ruins; and the belief is, that, should any one be rash enough to try and unearth this treasure, the *gâttes d'or* use a charm which allures the searcher towards them; and they then lead him on and on, till he loses himself in the bowels of the earth, when they disappear, and leave him to perish. The peasants point out the crevices in the rock under the ruins as being the passages through which the gnomes pass to and from their dwelling-places.

The superstitions held by the Walloons are shared by all the Belgian peasantry, in common with other nations who claim a northern origin. They believe in all kinds of omens, of which the following are the most universal. To meet a priest when about to undertake anything unusual, is considered a certain sign of failure, and the performer will invariably turn back, convinced that the day is lost. The hooting of owls, the howling of dogs, the crossing of forks, the spilling of salt, thirteen at table, are here, as elsewhere, taken for evil omens. Few will throw reeds in the fire, because they are of service to oxen; and an ox being present at our Saviour's birth, it ought, therefore, to be held as sacred. The bed of a dying person must be placed in such a position that the rafters cannot run in a contrary direction to it; for, unless they are parallel, the agonies of death would inevitably be protracted. When linen is washed, the water is never said 'to boil,' but 'to play;' otherwise, the clothes would be destroyed. To catch a wren is to bring sorrow or death into the family of its captor. Precious stones are supposed to possess virtues more valuable than their intrinsic worth. The turquoise guards its wearer from falls and accidents. Diamonds, emeralds, and pearls were formerly used to detect infidelity. An *ærolite* is said to be unsurpassed as a means for discovering a thief. The metal must be ground to powder, then mixed with flour and made into bread, of which no genuine thief can swallow the smallest portion. On Easter Sunday it was the custom to breakfast off two eggs that had been laid on Good-Friday, in order to render the eater proof against fever. To abstain from meat after Lent was a cure for the toothache.

On Christmas Eve a piece of the burnt Yule-log is preserved, and put under the bed, to serve as a protection against lightning; and a willow branch that has been blest on Palm Sunday is kept in a sacred corner. Peasants mark their walls with a cross, as a preventive against fire. During the annual fair at Fosse, in Namur, the women come from all parts carrying osier wands, with which they touch the image of St Bridget, and then stroke their cattle with the same wands, either to cure their ailments or to protect them from disease.

Notwithstanding that the mountainous districts are in all countries the strongholds of superstition, the lowlands here are full of the same beliefs. A curious custom was observed at Willebroeck, Vive St Bavon, and other villages near Courtrai. When any one dies, the clergy of the parish meet to conduct the body to the churchyard; and if on their way they chance to come to four cross-roads, the bearers put down the coffin, and all kneel to repeat a short prayer. The idea is, that those who have left the world are sure to return to it; that, as there are four ways, the traveller might wander aimlessly about, not knowing in which direction his home lay; therefore, his friends pray for him at one of the roads, so that he may choose the right path and not be misled by evil spirits. But at Oostmalle, a still more extraordinary observance prevails: the wife accompanies the dead body of her husband to the grave, sitting upon his coffin. There seems to be no satisfactory reason for this custom.

One of the most singular customs was that called the Court du Coucou, which occurred annually at Polleur. This ancient village lies at the bottom of the valley between Verviers and Spa, near the famous castle of Franchimont. On the first Sunday after the 15th of August, the fête was celebrated amid an immense gathering of people. A mock-court of justice was formed with a president, and all assembled at the inn nearest to the bridge which joined the village of Polleur to that of Sart. From the inn, the court adjourned to the bridge itself; and before its tribunal were summoned all the hen-pecked husbands and those who were possessed of any peculiarity. The proceedings began with the most ridiculous pleadings, and any stranger who happened to be present was constantly appealed to, and asked the most nonsensical questions. The accused, who were always found guilty, were condemned to pay a fine, which must be spent at the inn; and to give variety to the proceedings, the culprit was compelled to get into a cart, which was backed from the bridge till it reached a heap of mud or something similar, when it was tilted up, and the unhappy one was shot out. The trials by court concluded in the arraignment of the last married man in the village; and the fact being proved against him, he was at once thrown over the bridge into the river, which insured a good ducking. The rest of the day was spent at the inn.

Another feature of these ceremonies was the display of a banner on which was painted a nondescript monster called 'La Bête de Staneux.' It represented a kind of centaur, half-horse half-woman, with a lion's tail. Long hair floated down its back, and it held a bow in the left hand, and an arrow in the right. This picture

was exhibited at the different inns till 1789, when the fête was suppressed. From time immemorial, the banner had been carefully preserved within the walls of the parish church; and it was only after the year 1786 that the priests allowed it to be seen beyond them. During the same time, a figure rudely carved in wood, which usually stood in the church porch, was also exhibited, and burnt when the fête was abolished.

According to the best authorities, this Bête de Staneux was said to be a representation of the ancient goddess of the Ardennes, where Diana was worshipped under different names. The people of Polleur had a tradition that the picture was displayed in order to commemorate a victory gained over a monster who infested the neighbouring forest of Staneux.

The custom of celebrating the opening of the month of May was held everywhere in the vicinity of the Meuse; and some fifty years ago Maypoles were placed before roadside chapels, and images of the Virgin and other saints, and in front of the curés' houses. At Aerschot and many other places in the Campine, a Maypole was set up before the doors of unmarried women. The young and pretty had one decked with buds and flowers, while the older women had nothing but a stick covered with withered leaves.

The last observance worthy of notice is one that was retained in the church of Nivelles, where there was a crypt. Between the wall and a pillar close by was a hole, through which, the people believed, no one in a state of mortal sin could pass.

The well-known story of the 'white lady' belongs to these parts, and her traditions are preserved by the families of Angewieiller, Croy, Bassompierre, and Salm, all of whom it severally affects. This fairy gave as a love-token, to one of the Counts of Angewieiller, a goblet, a ring, and a spoon, which were to be kept as heirlooms, and given to his three daughters on their marriage days, to insure them happiness and prosperity. The goblet passed into the possession of the house of Croy; and one day, as a Marquise, who was a descendant of this family, was showing it to some of her friends, it slipped from her hands, and was broken into hundreds of pieces. Picking up every bit, she locked them carefully away in a cabinet, saying: 'If I cannot have it whole again, I will at least preserve every fragment.' The next day, when she went to the cabinet to look at the pieces, she found the goblet as perfect as it had been before the accident. So goes the story.

THE GOLDEN INCUBUS.

CHAPTER VIII.—THE SIGNET RING.

It was exactly twelve o'clock by the chiming timepiece in the hall. Just the hour for such a task, I felt with a sort of shiver, as Sir John came down to the pantry, where I had candles ready, and a small crowbar used for opening packing-cases, and a screw-driver.

'Everybody seems quiet up-stairs, Burdon,' says Sir John, 'so let's get to work at once.—But, hillo! just put out a lamp?'

'No, Sir John,' I said. 'I often smell that

now; but I've never been able to make out what it is.'

'Humph! Strange,' he says; and then we went straight to the cellar, the great baize door at the top of the kitchen steps being shut; and directly after we were standing on the damp sawdust with the bins of wine all round.

'It hasn't been touched, apparently, and there seems to be no need; but I should like to see if it is all right. But we shall never get through there, Burdon,' he says, looking at the bricked-up wall, across the way to the inner cellar.

'I don't know,' I said, taking off my coat and rolling up my sleeves, to find that though the highest price had been paid for that bricklaying, the cheat of a fellow who had the job had used hardly a bit of sand and bad lime, so that, after I had loosened one brick and levered it out, all the others came away one at a time quite clear of the mortar.

'Never mind,' says Sir John. 'Out of evil comes good.—I'll try that sherry too, Burdon, and we'll put some fresh in its place. But if that's left twenty years, we shall never live to taste it, eh?'

I shook my head sadly as I worked away in that arch, easily reaching the top bricks, which were only six feet from the sawdust; and, as is often the case, what had seemed a terrible job proved to be so easy, that, two hours afterwards, when Sir John had made me open a bottle of the bricked-up sherry, and fill two of the cellar glasses for us to have a drop apiece, there were all the bricks in a rough pile on one side, and the sherry was in a bin, and the empty bottles stacked in a corner.

'Maybe a little foul air in the place,' says Sir John; 'and we'll give it a bit of time to get out.—That's a very fine glass of sherry, my man,' he says, taking a good long sip, 'well matured. Ha! It's like the old cups and salvers turned into liquid gold.'

'My service and respects to my dear old master!' I said, as I stood before him where he sat on the pile of bricks, looking all covered with mortar and sawdust on his black dress clothes, and me ten times worse, and one hand bleeding as I took a taste of the finest sherry I ever drank in my life, which is saying a deal, for Sir John would have good wine.

'Thank you, Burdon,' he says in rather a husky way. 'Master and man all these years; but it's getting near the end now, when all men will be the same.—I beg your pardon, Burdon—my good old fellow—I called you a fool. Shake hands.'

'As you have called me many a time, my dear old master,' I said, as we stood there joined in a strong grip. 'But I know you, sir,' I said, smiling with the tears standing thick in my eyes—'yes, I know you, sir, and I don't mind.'

We neither of us spoke, for it seemed as if we both felt afraid lest the other should see how weak he was. But at last he says: 'Fill up the glasses again, Burdon. Working as we have been, a good glass of wine will not hurt either you or me.'

I did as he said. We drank the delicious fine old stuff slowly and solemnly; and then, after I'd put the bottle and glasses aside, I snuffed the candles.

'There,' he says; 'the place will be sweeter

now. We'll just have a glance at the old chests, and then we must build up the empty bottles again. To-morrow, I'll order in some more wine—for my son.'

He said that last so solemnly that I looked up at him as he stood there with the light shining in his eyes.

'As'll come back some day, sorry for the past, Sir John,' I said, 'and ready to do what you wish.'

'Please God, Burdon!' he says, bowing his head for a bit. Then he looked up quite sharply, and took a candle, and I the other. 'Come along,' he says in his old quiet, stern way; and I was half afraid I had offended him, as he stepped in at the opening and stood at the mouth of the inner cellar. Then I heard him give a sharp sniff, and I smelt it too—that same odour of burnt oil. We neither of us spoke as we walked over the damp black sawdust, both thinking of the likelihood of foul air being in the place; but we found we could breathe all right; and as we held up the candles, the light shone on the black-looking old chests, every one with its padlocks and seals all right, just as we had left them all those years before.

I looked up at Sir John, and he gave me a satisfied nod as he tried one of the seals, and then we both stood as if turned to stone, for from just at my feet there came a dull knocking sound, and as I looked down, I could see the black sawdust shake.

What I wanted to do was to run, for I felt that the place was haunted; but I couldn't move, and when I looked at Sir John, he was holding up his right hand, as if to order me to be silent. Then he held his candle down, for there was another sound, but this time more of a grinding cracking in a dull sort of way, just as if some one was forcing an iron chisel in between the joints of the stones. Then there was a long pause, and I half thought it had been fancy; but soon after, as I stood there hardly able to breathe, the sawdust just in one place was heaved up about an inch.

I was terribly alarmed, not knowing what to think; but Sir John was brave as brave, and he signed to me not to speak, and stood watching till there was a dull cracking sound, the sawdust was heaved up again, and all at once I seemed to get a hot puff of that burnt oily smell right in my nose. Then I began to understand, and felt afraid in a different fashion, as I knew that we had only got there just in time.

The next minute Sir John made a movement toward me, took my candle and turned it upside down, so that it went out, and then pointed back toward the outer cellar, as he put his lips to my ear:

'Iron bar!'

I stepped back softly, and got the iron bar from where it lay on the edge of a bin, and I was about to pick up the screw-driver, when I remembered where the wooden mallet lay, and I picked up that before stepping softly back to where Sir John was watching the floor; and now I could see that the sawdust was higher in one place, as if a flagstone had been heaved up a little at one end.

There was no doubt about it, for, as I handed the crowbar, the end of the stone was wrenched up a little higher and then stuck; for it was

tightly held by those on either side; but it was up far enough to let a thin ray of dull light come up through the floor and shine on the side of one of the old chests.

It was a curious scene there, in that gloomy cellar: Sir John standing on one side, candle in his left, the iron bar in his right hand, and me on the other bending down ready with the mallet to hit over the head the first that should come up through the floor. For, though horribly alarmed, I could understand now what it all meant—an attempt to steal the gold in the chests, though how those who were working below had managed to get there was more than I could have said.

As we watched, the smell of the burnt oil came through, and I knew that it must have been going on for a long time.

All at once we could hear a low whispering, and then there was a grinding noise of iron against stone; the flag gritted and gave a little, but it held fast all along; and I could understand that the man who was trying to wrench it up had no room to work, and therefore no power to wrench up the stone. Then came the faint whispering again, and it seemed to sound hollow. Then another grinding noise, and the end of the flag was moved a trifle higher, so that the line of light on the old chest looked two or three inches broad.

I stepped softly to Sir John and put my lips to his ear as the whispering could be heard again, and I said softly: 'Shall I fetch the police?'

Sir John for answer set his candle down upon the top of one of the chests and put it out with the bar as he whispered to me in turn: 'Wait a few moments.' And then—'Look!' He pointed with the iron bar; and as I stared hard at the faint light shining up from below the edge of the stone, I could see just the tips of some one's fingers come through and sweep the sawdust away to right and left. Then they came through a little more, and were drawn back, while directly after came the low whispering again, and the hand now was thrust right through as far as the wrist.

'Yes,' said Sir John then, as he grasped my arm—'the police.' Just then he uttered a gasp, and I turned to look at him; but we were in the dark, and I could not see his face, but he gripped my arm more tightly, and I looked once more toward the broad ray, to see the hand resting now full in the light, and I turned cold with horror, for there was something shining quite brightly, and I could see that it was a signet ring, and what was more, the old ring Mr Barclay used to wear—the one he had worn since he was quite a stripling, and beyond which the joint had grown so big that he could never get the jewel off.

I should have bent down there, staring at that ring for long enough, fascinated, as you may say, until all at once I felt my arm dragged, and I was pushed softly into the outer cellar, and from there into the passage beyond, Sir John closing and locking the door softly, before tottering into the pantry and sinking into a chair, uttering a low moan.

'Oh, don't take on, sir,' I whispered; but he turned upon me roughly.

'Silence, man!' he panted, 'and give me time to think;' and then I heard him breathe softly, in a voice so full of agony that it was terrible to hear: 'Oh, my son!—my son!'

'No, no, sir,' I said—for I couldn't bear it. 'He wouldn't; there's some mistake.'

'Mistake? Then you saw it too, Burdon? No; there is no mistake.'

I couldn't speak, for I remembered about the keys, and something seemed to come up in my throat and choke me, for it seemed so terrible for my young master to have done this thing.

'What are you going to do, sir?' I said at last, and it was me now who gripped his arm.

'Do?' he said bitterly. 'All that is a heritage: mine to hold in trust for my son—his after my death to hold in trust for the generations to come. Burdon, it is an incubus—a curse; but I have my duty to do: that old gold shall not be wasted on a wanton!'

'What!' I panted. 'You think that too?'

'Yes,' he cried fiercely. 'It is that wretched Jezebel who has turned my poor boy's brain!'

CHAPTER IX.—MR BARCLAY GOES TOO FAR.

When young Mr Barclay—

Stop! How do I know all this?

Why, it was burned into my memory, and I heard every word from him.

When young Mr Barclay left the dining-room on the night he disappeared, he went up to his own room, miserable at his position with his father, and taking to himself the blame for the unhappiness that he had brought upon the girl who loved him with all her sweet true heart. 'But it's fate—it's fate,' he said, as he went up to his room; and then, unable to settle himself there, he lit a cigar, came down, and went out just as he was dressed in his evening clothes, only that he had put on a light overcoat, and began to walk up and down in front of our house and watch the windows opposite, to try and catch a glimpse of Miss Adela.

Ten o'clock, eleven, struck, but she did not show herself at the window; and feeling quite sick at heart, he was thinking of going in again, when he suddenly heard a faint cough, about twenty yards away; and turning sharply, he saw the lady he was looking for crossing the road, having evidently just come back from some visit.

'Adela—at last,' he whispered as he caught her hand.

'Mr Drinkwater!' she cried in a startled way. 'How you frightened me.'

'Frightened?' he said reproachfully. 'Is that all you have to say to one who has patiently watched for weeks, trying in vain to get a few words with you!'

'How absurd!' she said, as he held her hand and detained her. 'What can you want?'

'You!' he said excitedly.—'Don't struggle to get away. Listen to me!'

'No, no, no!' she cried in a half-frightened way. 'Let me go. My sisters are waiting.'

'Let you go? How can you be so cruel to me? Adela, dearest, you know I love you.'

'What madness—what nonsense!—Mr Drinkwater, loose my hand!'

'Never! till you give me some hope.—Adela, your looks have told me so a hundred times—have led me on to speak so plainly—you do love me—you will be my wife?'

'Impossible!' she panted as she tried to get away. 'You cannot marry me.'

'I can—I will!' he cried passionately. 'I have given her up for your sake. I will not be driven into a marriage that would end in misery. Adela, dearest, listen to me.'

'Mr Drinkwater!'

'I can bear this no longer. You are trifling with me.'

'No, no; I am perfectly serious. You must never think of me again. My sisters would'—

'Would listen to me. I'm sure they would.'

'Now, Mr Drinkwater, pray be sensible. This is absurd, out in the open street.'

'There is no one to hear us, and you refuse to grant me an interview.'

'Of course,' she cried. 'I have told you again and again that it is impossible, and that I cannot listen to you.'

'Yes,' he said; 'but with your beautiful mocking eyes laughing the while and bidding me come on.'

'It is not true,' she said, laughing.—'Mr Drinkwater, will you let me pass?'

'I will, and walk with you.'

'If you please, no.'

'Indeed, but I will,' he cried; and he kept by her till she reached the steps. 'It is not proper for a beautiful young girl to be out at eleven o'clock alone.'

'Well, there: now I am at our door, so good-night, Mr Ungallant,' she said mockingly.

'No, not yet.'

'What do you mean?'

'I mean that I've begged for an interview until I can beg no more, and now I am going to enforce it.'

'Are you mad?'

'Very nearly,' he said; and as she hurriedly thrust in the latchkey, he held her other hand.

'Now, will you loose my hand?' she panted excitedly. 'My sisters'—

'I'm coming in to see them in a straightforward English manner,' he said, for he was as obstinate now to persist as she evidently was to shake him off.

'Indeed, you are not,' she cried, slipping from him and through the door; but before she could close it, he had thrust it back and stood beside her in the passage, which was feebly lit by a half-turned-down oil lamp.

'Oh, this is madness. How can you be such a fool!'

'Love makes men fools,' he retorted, closing the door.—'Now take me up and introduce me to your sisters.'

'What—what shall I do?' she muttered. 'Pray, pray, go!'

'No; I have stormed the castle now,' he cried, laughingly, though he half wondered at her calling him a fool, 'and mean to stay till the lovely little garrison yields at discretion.'

'No, no; for your life, you must go,' she cried, trying to push him toward the door. 'Pray, pray, go!'

'Never! You have driven me to this by your mocking looks, so now give way and don't let's trifle any more.'

She backed from him, trembling now, till she reached the dining-room, into which she darted and tried to shut the door; but he was too quick, and followed her in, when she ran from him to

sink sobbing into an easy-chair, and in an instant he was on his knees before her.

'Adela, dearest Adela,' he whispered tenderly; 'forgive me all this, but'—

'Adela, is that you?—Here, for goodness' sake. —Why don't you answer?'

'Is she there?'

The first was a rough man's voice, the next that of a woman, and as they were heard in the passage, another voice cried hoarsely: 'It's of no use: the game's up.'

'Hist! Hide! Behind that curtain! Anywhere!' panted Adela, starting up in alarm. —'Too late!'

Barclay had sprung to his feet, and stood staring in amazement, and perfectly heedless of the girl's appeal to him to hide, as two rough bricklayer-like men came in, followed by a woman.

'It's caved in, and Ned is hurt,' cried the first man; and then: 'Who's this?'

'What?—No, no, no!' cried Adela wildly. 'Don't, don't say he's hurt.'

'Here, who's this?' said the first man again. 'Oh, it's you, is it?'

'Trapped!' muttered Barclay Drinkwater, as, without fully understanding his position, he realised the fact that there was something peculiarly wrong in the place into which he had forced himself; and his first act now was to make for the door; but it was blocked by the two men, while the oldish woman who had entered with them gazed at him viciously.

'Stand where you are!' said the first of the men.—'How comes he here, Adela?'

'I couldn't help it, Tom. He forced his way in. It's all a mistake. It's Mr'—

'Oh, I know who it is well enough,' said the man savagely. 'Forced his way in? Very well. He wouldn't come here unless he wanted to stop, and stop he shall.'

'Let me pass,' said Mr Barclay sternly.

'Not me,' said the man, with an ominous look.

'Yes, yes; let him go,' cried the girl. 'I'll explain all to Ned. And you all stand there, and don't come to his help.'

'Ten minutes more or less won't hurt, my girl,' cried the man.

'Will you let me pass?' cried Mr Barclay.—'Miss Mimpriss, I beg your pardon for this intrusion. Forgive me, and good-night.'

One man gave the other a quick look, and as Mr Barclay tried to pass, they closed with him, and, in spite of his struggles, bore him back from the door. The next moment, though, he recovered his lost ground, and would have shaken himself free, but the sour-looking woman who had entered with the two men watched her opportunity, got behind, flung her arms about the young man's neck, and he was dragged heavily to the floor, where, as he lay half stunned, he saw Adela gazing at him with her brows knit; and then, without a word of protest, she hurried from the room.

Mr Barclay heaved himself up, and tried to rise; but one of his adversaries sat upon his chest while the other bound him hand and foot, an attempt at shouting for help being met by a pocket-handkerchief thrust into his mouth.

A minute later, as Mr Barclay lay staring wildly, the rough woman, whom he recalled now as one of the servants, and who had hurried from

the room, returned, helping Adela to support a pallid-looking man, whose hands, face, and rough working clothes were daubed with clayey soil.

'Confound you! why didn't you bring down the brandy?' he said harshly.—'Gently, girls, gently. That's better. I'm half crushed.—Who's that?'

'Visitor,' said one of Mr Barclay's captors sourly. 'What's to be done?'

Mr Barclay looked wildly from one to the other, asking himself whether all this was some dream. Who were these men? Where the elderly Misses Mimpriss? And what was the meaning of Adela Mimpriss being on such terms with the injured man, who looked as if he had been working in some mine?

Their eyes met once, but she turned hers away directly, and held a glass of brandy to the injured man's lips.

'That's better,' he said. 'I can talk now. I thought I was going to be smothered once.—Well, lads, the game's up.'

'Why?' said one of the others sharply.

'Because it is. You won't catch me there again if I know it; and here's private inquiry at work from over the way.'

'Hold your tongue!' said the first man of the party. 'There; he can't help himself now. You watch him, Bell; and if he moves, give warning.'

The rough woman seated herself beside Mr Barclay and watched him fiercely. The two men crossed over to their companion; while Adela, still looking cold and angry, with brow wrinkled up, drew back to stand against the table and listen.

The men spoke in a low tone; but Mr Barclay caught a word now and then, from which he gathered that, while the man who had in some way been hurt was for giving up, the other two angrily declared that a short time would finish it now, and that they would go on with it at all hazards.

'And what will you do with him?' said the injured man grimly.

Mr Barclay could not help looking sharply at Adela, who just then met his eye, but it was with a look more of curiosity than anything else; and as she realised that he was gazing at her reproachfully, she turned away and watched the three men.

'Very well,' said the one who was hurt, 'I wash my hands of what may follow.'

'All right.'

Mr Barclay turned cold as he wondered what was to happen next. He saw plainly enough now that the house had been let to a gang of men engaged upon some nefarious practice, but what it was he could not guess. Coining seemed to be the most likely thing; but from what he had heard and read, these men did not look like coiners.

Then a curious feeling of rage filled him, and the blood rushed to his brain as he lay reproaching himself for his folly. He had been attracted by this woman, who was evidently thoroughly in league with the man who spoke to her in a way which sent a jealous shudder through him, while the sisters of whom he had once or twice caught a glimpse, seemed to be absent, unless—The thought which occurred to him seemed to be so wild that he drove it away, and lay waiting for what was to come next.

'Be off, girls!' said the first man suddenly; and without a word, the two women present left the room, Adela not so much as casting a glance in the direction of the prisoner.

The three men whispered together for a few moments, and then Mr Barclay made an effort to get up, but it was useless, for the first two seized him between them, all bound as he was, and dragged him out of the room, along the passage, and down the stone steps to the basement, where they thrust him into the wine-cellar, and half dragged him across there into the inner cellar, the houses on that side being exactly the same in construction as ours.

'Fetch a light,' said one of them; and this was done, when the speaker bent down and dragged the handkerchief from the prisoner's mouth.

'You scoundrel!' cried Mr Barclay.

'Keep a civil tongue in your head, my fine fellow,' he said.

'You shall suffer for this,' retorted Mr Barclay.

'Pr'aps so. But now, listen. If you like to shout, you can do so, only I tell you the truth: no one can hear you when you're shut in here; and if you do keep on making a noise, one of us may be tempted to come and silence you.'

'What do you want?—Money?'

'You to hold your tongue and be quiet. You behave yourself, and no harm shall come to you; but I warn you that if you attempt any games, look out, for you've desperate men to deal with. Now, then, will you take it coolly?'

'Tell me first what this means,' said Mr Barclay.

'I shall tell you nothing. I only say this—will you take it coolly, and do what we want?'

'I can't help myself,' says Mr Barclay.

'That's spoken like a sensible lad,' says the second man.—'Now, look here: you've got to stop for some days, perhaps, and you shall have enough to eat, and blankets to keep you warm.'

'But, stop here—in this empty cellar?'

'That's it, till we let you go. If you behave yourself, you shan't be hurt. If you don't behave yourself, you may get an ugly crack on the head to silence you. Now, then; will you be quiet?'

'I tell you again, that I cannot help myself.'

'Shall I undo his hands?' said one to the other.

'Yes; you can loosen them.'

This was done, and directly after Mr Barclay sat thinking in the darkness, alone with as unpleasant thoughts as a man could have for company.

A NEW THEORY REGARDING THE UNIVERSE.

It is a wonderful thought to consider, that although we human creatures can by no possible means convey ourselves outside the confines of the globe upon which our lives are passed, we have been able to learn so much about those other globes and appearances which are popularly spoken of as 'the heavenly bodies.' The knowledge has, it is true, been slowly acquired. A theory has been enunciated to last for a time, perhaps for centuries, when it is pushed out of

place by some other theory, which perhaps in its turn may soon have to give place to a newer one. How natural was it for the ancient observers to suppose that the various orbs which appear to execute so stately a march across the sky, together with those seemingly much larger bodies the sun and moon, were travelling round the earth as a centre. This, the Ptolemaic theory was so plausible, and one so evidently in accordance with common-sense, that it held its ground for eighteen centuries. Thales, Pythagoras, and others had previously taught a different lesson, and one more in accordance with modern ideas. But their followers were few, and their teachings were discredited because they seemed to be contrary to the ideas gleaned from popular observation. Seeing was believing then, as it is now; and when the stars were seen to move across the heavens, and the sun and moon to rise and set, it was only natural to assume that their movements were real, and that the earth was as still and immovable as it appeared to be. Then came Copernicus, who retaught the forgotten doctrine of the earth's movement on its own axis, and its annual journey round the sun as the centre of our system. Galileo corroborated this hypothesis by his telescopic observations; and Newton crowned all by his grand conception of gravitation. In this way, the now universally accepted theory of the solar system was founded.

But the solar system, vast though it be—its most remote member, Neptune, is 2,745,998,000 miles from the sun—really constitutes but a very small part of the great scheme of the universe. The nearest of the so-called fixed stars is so distant from us that we have no means of measuring that distance, and when astronomers endeavour to give to others some idea of their remoteness, they tell us that light—which travels at the rate of one hundred and eighty-six thousand miles per second—would occupy so many centuries in bridging the gulf which separates us from those remote bodies. We see, therefore, that any difficulty which we may have in learning about the constitution of the planets which form members of our own system, is immensely increased when we come to ask for information concerning the far more distant stars. In the one case we are dealing with things which are, so to speak, within reach of our hands; and in the other case, with objects which are upon another continent.

The only messengers which reach this earth from space are the so-called shooting-stars, or meteorites. These are assumed to be dark bodies, which, travelling through space, become attracted by this earth, and are quickly drawn towards it by the irresistible power of gravitation. Upon entering our atmosphere—which, it will be remembered, extends about two hundred miles above the surface of the earth—the course of these meteorites is checked by the resistance which the air offers to their progress—a frictional resistance, which is accompanied by the evolution of light and fervent heat. As a result, these swiftly moving bodies are vaporised; but the vapour formed quickly condenses into solid particles—meteoric dust, which is deposited, slowly but surely,

upon the earth. Such dust has been found on the pure snow of the Arctic regions, where dust of the ordinary kind is impossible. It has also been collected on the tops of elevated buildings, and has been dredged up from the depths of the Atlantic.

Besides this celestial dust, which is slowly adding to the bulk of the earth, there are many authentic records of the fall of meteoric stones of large size, many of which have been preserved as curiosities in our public museums. These shooting-stars are familiar enough to us; perhaps some will say that they are too common to be regarded as phenomenal. But few persons are aware how plentiful these beautiful objects really are. We are indebted to Professor Newton of America for some statistics with regard to them. He made a series of careful calculations, with a view to discover as nearly as possible how many meteorites enter the atmosphere of this earth in a given time, and so become visible. As a result, he has found that the annual number is about 146,000,000,000. That is to say, in every twenty-four hours, no fewer than four hundred million meteorites are propelled towards and received by the earth. And this number, be it noted, does not include that vast number of shooting-stars which are called telescopic, for the reason that they are too small or too distant to be detected by the unaided eye. It is therefore easy to see that the earth in travelling along her orbit passes through showers of these meteoric stones, and that it is only by the protecting influence of our atmosphere that these stones do not represent deadly missiles to its inhabitants. Travelling at the enormous velocity of thirty miles a second, they would, were it not for that protection, be far more effective projectiles than the swiftest of cannon-balls.

Upon a close investigation of the nature and composition of these meteoric stones, Mr Norman Lockyer has founded a new theory with regard to the constitution of the heavenly bodies. Like all theories, it will have to bear the test of time, either to be preserved, or to be discarded for something better. Still, until that something better makes its appearance, we must admit, upon considering this new hypothesis, that it contains nothing but what seems to be consistent with truth. Let us endeavour to explain in a very brief manner the salient points of this new doctrine.

We know that meteors have a tendency to collect in swarms, and that these form closed rings, which travel in elliptical orbits round the sun. On two nights in the year—one in August, and one in November—the earth's orbit intersects these meteor-paths, and on those nights shooting-stars are plentiful. In 1866, Schiaparelli showed that one of these swarms of meteors had an orbit which was identical with the path of a certain comet, an observation which led to the inference that a comet consists of a mass of meteors rendered luminous or incandescent by frequent and innumerable collisions among themselves. This theory of the genesis of a comet is now widely accepted among astronomers. Mr Lockyer not only accepts this view, but he holds that all the heavenly bodies owe their origin to meteorites. He tells us that all self-luminous bodies in the heavens are composed of meteorites, or

masses of 'vapour produced by heat brought about by condensation of meteor-swarms due to gravity,' and that 'the existing distinction between stars, comets, and nebulae rests upon no physical basis.' But how, it will be asked, does Mr Lockyer seek to prove the truth of this new hypothesis? The answer to this reasonable inquiry is, that he depends upon the evidence of the spectroscope.

Let us, for the benefit of those who have not had an opportunity of following up the more recently trodden paths of scientific research, give a few words to this marvellous instrument. The spectroscope is the outcome of the labours of many minds. Two hundred years ago, the great Newton made the first contribution towards it by admitting a beam of sunlight through a round hole in the shutter of a darkened room and causing that beam to pierce a prism of glass. The prism split up the white light into its constituent coloured rays. Many years afterwards, Professor Wollaston substituted a slit for the round hole in the shutter, and found that this alteration led to a strange result. The coloured ribbon of light was no longer continuous, as with Newton, but was cut across by many dark lines. Fraunhofer, a German optician, mapped these lines to the number of several hundred, and they have since been called by his name. No one knew what they meant until the year 1835, when Bunsen and Kirchhoff discovered the secret. These two investigators were examining the light given by different metals when volatilised in the intense heat of the electric arc. They made this examination by means of the spectroscope, an instrument consisting of a prism placed in a tube, with an adjustable slit at one end, and a magnifying-glass at the other end. (This instrument, it will be seen, is simply a convenient modification of the darkened room with a slit in its shutter.) They noticed that each metal gave certain distinctive bright lines, and that these bright lines were identical in position with certain dark lines on the solar spectrum. They next found that the dark lines were due to the vapours of the burning metals, and that the corresponding bright lines were only seen when the glowing metals themselves were examined.

Such is, briefly, the history of the spectroscope, an instrument which has added enormously to our knowledge during the past forty years. The dark lines in the solar spectrum tell us that a large number of the metals known to us on this earth are in a state of active combustion in the sun. We are also able, with the spectroscope, to examine the light given by stars, comets, and nebulae, and to gain by the nature of their spectra some idea as to their composition. The spectroscope, in short, offers us a means of analysing the light given by a body so remote from us that that light takes centuries of time before it can reach this earth. And it should be noted that by this wonderful method of spectrum analysis we cannot only identify the nature of the glowing matter in these far-off regions of space, but we can also get an approximate idea of the temperature at which it glows. Some of these distant bodies—nebulae, for instance—represent a heat which can be compared with that of the familiar Bunsen burner; other bodies are associated with the heat given by the oxyhydrogen flame; others, again, with the far higher temperature of the

electric arc; while the brightest stars of heaven—Sirius, for example—glow with a heat unattainable by any means at the disposal of man.

We have already pointed out that the only substance which reaches this earth from outside space is the meteorite. It is something ponderable, which cannot only be handled, but can be subjected to chemical analysis, and to the still more searching eye of the spectroscope. Mr Lockyer founds his new theory upon the constitution of the meteoric stone. Volatilising these meteorites at various temperatures, and examining their spectra, he finds that there is a wonderful agreement in character between the spectra so obtained and the spectra of the various classes of heavenly bodies just mentioned. We will quote his own words with reference to the application of this method to solar observation. He says: 'The solar spectrum can be very fairly reproduced—in some parts of the spectrum, almost line for line—by taking a composite photograph of the arc spectrum of several stony meteorites, chosen at random, between iron meteoric poles.' It is impossible to describe fully in a popular manner the innumerable and patient experiments, extending over a period of fourteen years, which have guided Mr Lockyer to the conclusions at which he has arrived. To understand the force of his arguments, one must have something more than a casual knowledge of the wonderful instrument which has assisted him in his labours. To summarise the matter: He seeks to prove that the whole of the heavenly bodies are due to the ubiquitous meteorite—sparsely clustered—their luminosity being due to glowing gases let loose by their collisions among themselves—and we have the nebulae. Drawn within the attractive influence of the sun, such clusters become comets. A further development is seen in a certain class of stars, where gravity has caused a nearer approach of the constituent meteorites. And at length we reach the highest stage of all, where the meteorites are volatilised, and the star is a mass of incandescent vapour at a temperature beyond our ken. The spectroscope therefore teaches us of what stuff the stars are made, and the physical reason for the fact that 'one star differeth from another in glory.'

THE LONDON POLICE.

THE London police force, like all the institutions of that vast metropolis, is arranged upon a gigantic plan. The superintendents, inspectors, sergeants, and constables make up an army thirteen thousand eight hundred strong—a truly formidable force, but none too large, when it is considered that the Metropolitan Police District extends over a radius of fifteen miles from Charing Cross, exclusive of the City of London and its liberties, and embraces an area of six hundred and eighty-eight square miles, of a rateable value of thirty-three million eight hundred thousand pounds per year. Over such an area as this, including as it does a population of some five million three hundred and sixty thousand persons, there is of course a vast amount of work to be done; and it must be borne in mind that the duties of the London police are not

limited to the taking into custody of criminals and disorderly persons, and the watching of property, but include such duties as the carrying out of the Smoke Abatement Acts, the inspection of common lodging-houses, regulation of street traffic, and at certain times the onerous duty of taking up stray dogs—all of which duties are anything but light in a town like London; nor are they likely to become less arduous, seeing that during the year 1886 twelve thousand two hundred and fifty-two new houses were built within the police district, making twenty-nine miles of new streets.

The number of persons apprehended by the police during the year 1886 was seventy-two thousand one hundred and thirty. The value of property stolen during the same period was one hundred and eighteen thousand three hundred and forty pounds, of which eighteen thousand one hundred and twenty-nine pounds was recovered, leaving a net loss of one hundred thousand two hundred and eleven pounds; but the latter sum, it is to be presumed, would be set down by certain parties as a net gain. Notwithstanding the vast size of London, it is somewhat astonishing to notice that no fewer than seventeen thousand eight hundred and two persons were reported to the police as missing, and eight thousand nine hundred and forty-three were found and restored to their friends. During the twelve months, there occurred one thousand and fifty fires, fifty-eight of which were extinguished by the police. The truth of the saying, that it is safer to travel by railway than to walk the streets of London, would seem to be quite verified by the fact that the number of persons known by the police to have been run over and killed in the streets was one hundred and fourteen, the number maimed or injured from the same cause being three thousand nine hundred and forty-nine.

During the year, licenses were issued to hackney drivers, stage-drivers, and conductors to the number of twenty-six thousand three hundred and twenty; and it is very interesting to observe that amongst these men there are nine hundred and eighty-seven over sixty and under seventy years of age; one hundred and thirty over seventy and under eighty; and four over eighty years old. Occasionally, a London driver may have the chance of a windfall in the shape of property left in his conveyance, for it seems that last year the number of articles left in public carriages, &c., and deposited in the hands of the police, was twenty-two thousand three hundred and sixty-one, out of which twelve thousand one hundred and eleven were restored to the owners, who paid as rewards to the finders sums amounting to one thousand nine hundred and ninety-three pounds, representing a value of between fifteen and sixteen thousand pounds. Among the 'finds' the following are some of the most remarkable: Bag with two hundred and sixteen pounds in notes and gold; another bag containing one hundred pounds in notes; a third bag with bonds to the amount of three hundred pounds; and several lots of cash varying from ten to fifty pounds. After the articles have been deposited for three months, they are, in the absence of being claimed by the owners, returned to the parties depositing them.

THE SLEEPERS.

A CONTRAST.

BEHOLD them slumbering side by side,
Fair smiling youth and hoary age :
One dreams of worldly pomp and pride,
Where men a godless warfare wage ;
The other dreams of summer bowers,
Bright sunshine, warbling birds, and flowers.

One brow is marked with lines of care,
Which shows the world-worn spirit grieves ;
The other gleams 'neath clustering hair,
Like a fair star through quivering leaves.
One heart is grasping, proud, and cold ;
The other, generous, warm, and bold.

One breathes a long, a weary sigh,
And dreams of earthly gain or loss,
As with a keen, suspicious eye,
He counts once more his glittering dross ;
The other bounds with joyous tread
O'er fields of clover white and red.

A groan escapes the old man's lips,
A groan of mingled rage and pain,
For, lo ! his schemes, like phantom ships,
Have vanished 'neath the treacherous main.
He stretches forth one wrinkled hand,
To find his treasured hoard but sand.

From parted lips of tender bloom
A trill of merry laughter steals,
Whose fairy music fills the room—
The happy boy in dreamland kneels
Above a little crystal stream,
Where rushes wave and pebbles gleam ;

And he beholds with sparkling eyes
His ship—a water-lily—glide
Beneath the rosy-tinted skies,
Right bravely down the dimpling tide.
His bark no sordid hopes doth bear,
But dances on, he cares not where.

Hark ! now the dreaming worldling speaks :
'The path to wealth, how drear, how long !'
'Ah !' cries the boy, with glowing cheeks,
'How lovely is the skylark's song,
High soaring 'mid the blue above,
For ever singing, God is love !'

And when the morning sun shall rise
To charm away the mists of night,
The boy will greet with gladdened eyes
A world of beauty bathed in light,
For a fond mother's morning kiss
Will ope its golden gates of bliss.

But the poor worldling, what of him ?
Will he not seek the busy mart,
Like some gaunt spectre, stern and grim,
No joy within his withered heart ?
For life is empty, vain, and cold
To him who only seeketh gold !

DARWIN.

It is always interesting to have from men of real eminence some record of their own lives, of the thoughts and feelings which animated them in certain critical periods of their career, and of the steps which led them to the execution of the work that made for them a name. In the autobiographical chapter prefixed to this life of Darwin,* we feel sure that a great many readers will be deeply interested, even should a limited knowledge of the scientific questions with which his name is associated lead them to regard the rest of the volumes with more or less of indifference. In the record which Darwin left for his family of the events of his own life, he writes with a simplicity and candour altogether removed from affectation on the one hand or ostentation on the other; revealing to us a man who was always more astonished at his success than conscious of the splendid abilities which rendered that success possible. It is not necessary to enter into the scientific considerations upon which his fame rests: that may be regarded as established whether we agree with his opinions or not; but it never can be a matter of indifference to any one to know the circumstances by which he was led, step by step, in the direction of the theories which go by his name, and to hear from his own lips the story of his achievements. 'A German editor,' he says, 'having written to me for an account of the development of my mind and character, with some sketch of my autobiography, I have thought that the attempt would amuse me, and might possibly interest my children or their children. I know that it would have interested me greatly to have read even so short and dull a sketch of the mind of my grandfather [Erasmus Darwin] written by himself, and what he thought and did, and how he worked. I have attempted to write the following account of

myself, as if I were a dead man in another world looking back at my own life. Nor have I found this difficult, for life is nearly over with me.' This was written in August 1876, when he was in his sixty-eighth year.

Charles Darwin was born at Shrewsbury, on the 12th of February 1809. His father, who practised in that town as a physician, was a man noted for his good sense, his sterling qualities of mind and character, and the remarkable power of sympathy by which he won the confidence of his patients. But he does not appear to have laid any claim to special scientific knowledge or abilities. If there was any play of heredity in the peculiar development of Charles Darwin's scientific powers, that must be traced back, not to his father, but to his grandfather, Erasmus Darwin, who wrote a semi-scientific book in verse on *The Loves of the Plants*, as well as other works in prose, and who really did anticipate, in a way that could not be understood by his contemporaries, some of the conclusions which his gifted grandson was afterwards to make the common property of the scientific world. But if Darwin's father was not the immediate transmitter of the scientific genius, he did for his son what was of an importance not to be overlooked in its bearing on his son's career: he left him a handsome fortune, which enabled the investigator into the Origin of Species to carry on his lifelong researches undisturbed by the distractions of narrowed circumstances or the pressure of family wants. It is true that we know of many who have done great things in spite of their poverty; but who can tell how many other great things the presence of this poverty has effectually crushed?

Charles Darwin was sent to school in his eighth year. 'I must,' he says, 'have been a very simple little fellow when I first went to school. A boy of the name of Garnett took me into a cake-shop one day and bought some cakes, for which he did not pay, as the shopman trusted him. When he came out, I asked him why he did not pay for them, and he instantly answered: "Why, do you not know that my uncle left a great sum of money

* *The Life and Letters of Charles Darwin, including an Autobiographical Chapter.* Edited by his son, Francis Darwin. 3 vols. London: Murray. 1887.

to the town on condition that every tradesman should give whatever was wanted without payment to any one who wore his old hat and moved it in a particular manner?" And he then showed me how it was moved. He then went into another shop where he was trusted, and asked for some small article, moving his hat in the proper manner, and of course obtained it without payment. When he came out, he said: "Now, if you like to go by yourself into that cake-shop (how well I remember its exact position), I will lend you my hat, and you can get whatever you like if you move the hat on your head properly." I gladly accepted the generous offer, and went in and asked for some cakes, moved the old hat, and was walking out of the shop, when the shopman made a rush at me; so I dropped the cakes and ran for dear life, and was astonished by being greeted with shouts of laughter by my false friend Garnett.' But Darwin was not without some spice of trickery himself. He mentions one incident by which his conscience was afterwards 'sorely troubled,' and which, he adds, was 'curious, as showing that apparently I was interested at this early age in the variability of plants. I told another little boy that I could produce variously coloured polyanthus and primroses by watering them with certain coloured fluids; which was of course a monstrous fable, and had never been tried by me. I may here also confess that as a little boy I was much given to inventing deliberate falsehoods, and this was always done for the sake of causing excitement. For instance, I once gathered much valuable fruit from my father's trees and hid it in the shrubbery, and then ran in breathless haste to spread the news that I had discovered a hoard of stolen fruit.' It is clear that Darwin can never be included among the remarkable specimens of immaculate boyhood 'who never told a lie.'

As a pupil he was considered dull, and he admits himself that he was slow in learning. But, on the other hand, the system of education under which he was trained was, as it should seem, singularly unfitted to develop his peculiar mental faculties, it being strictly classical. Nothing else indeed was taught in the school which he attended except a little ancient geography and history. 'I was considered,' he says, 'by all my masters and by my father as a very ordinary boy, rather below the common standard in intellect. To my deep mortification, my father once said to me: "You care for nothing but shooting, dogs, and rat-catching, and you will be a disgrace to yourself and all your family." But my father, who was the kindest man I ever knew, and whose memory I revere with all my heart, must have been angry and somewhat unjust when he used such words.' But while he did not benefit by the classical training to which he was subjected, the boy learned Euclid—taught him by a private tutor—with avidity, and he afterwards distinctly remembered 'the intense satisfaction which the clear geometrical proofs' afforded him.

During the latter part of his school career, he became passionately fond of shooting, and to this is perhaps to be attributed his first experience of the sights and sounds of Nature—the first drawing-out of those remarkable powers of close and accurate observation as applied to animal and

vegetable life which afterwards so distinguished him. In addition to Euclid, also, he had been studying a little chemistry in a private way; but this becoming noised abroad in the school, and being an unprecedented fact there, it procured him the nickname of 'Gas.' For 'thus wasting his time on such useless subjects,' he was publicly rebuked by the head-master, the good man no doubt thinking that for every one alike the ability to produce an accurate Latin hexameter was the best possible equipment for the battle of life. As the boy was doing no good at school, his father took him away, and sent him, in 1825, to Edinburgh University, where his elder brother was completing his medical studies. Here Darwin stayed for two years or sessions, but made little progress, as he could not stand seeing operations performed in those old ante-chloroform days, and was obliged to rush out of the operating-room. The account he has left of the lectures in the Edinburgh University of that period is not flattering. He had one pleasant reminiscence, however, of his residence in the northern capital. He was once taken to a meeting of the Royal Society, where, he says, 'I saw Sir Walter Scott in the chair as President, and he apologised to the meeting as not feeling fitted for such a position. I looked at him and at the whole scene with some awe and reverence; and I think it was owing to this visit during my youth, and to my having attended the Royal Medical Society, that I felt the honour of being elected, a few years ago, an honorary member of both these Societies, more than any other similar honour.'

Darwin's father perceiving, or hearing from the boy's sisters, that he did not like the thought of being a physician, proposed that he should prepare to enter the Church. 'Considering how fiercely I have been attacked by the orthodox,' he himself remarks, 'it seems ludicrous that I once intended to be a clergyman. Nor was this intention and my father's wish ever formally given up, but died a natural death when, on leaving Cambridge, I joined the *Beagle* as naturalist.' But it was at Cambridge that his scientific instincts entered upon their development. As far as the academical studies were concerned, his time, he tells us, was as completely wasted during the three years he spent there, as it had been at Edinburgh and at school. But he took to field-science. He had been 'so sickened' by the kind of geological lectures he had heard at Edinburgh, that he did not attend the geological lectures at Cambridge; he, however, attended Professor Henslow's lectures on botany, and liked them much for their extreme clearness and the admirable illustrations. But that Professor's field-excursions were what interested our young naturalist most; and no pursuit at Cambridge was followed by him with so much eagerness, or gave him so much pleasure, as collecting beetles. 'It was,' he says, 'the mere passion for collecting, for I did not dissect them, and rarely compared their external characters with published descriptions, but got them named anyhow. I will give a proof of my zeal. One day, on tearing off some old bark, I saw two rare beetles, and seized one in each hand; then I saw a third and new kind, which I could not bear to lose, so that I popped the one which I had in my right hand into my mouth. Alas! it ejected some intensely acrid fluid, which burned my tongue, so

that I was forced to spit the beetle out, which was lost, as was the third one.*

It is here, at Cambridge, that we first find a distinct indication of the existence in Darwin of that special genius for which he was afterwards noted. Other naturalists have been as diligent as he, and as patient in observation and analysis; but what specially distinguished Darwin as an observer was the singularly original methods and experiments which he devised for obtaining fresh specimens or bringing out some new phenomenon of animal or vegetable life. All readers of his books must have been struck by this. Well, at Cambridge he 'invented two new methods.' 'I employed,' he says, 'a labourer to scrape, during the winter, moss off old trees, and place it in a large bag, and likewise to collect the rubbish at the bottom of the barges in which reeds are brought from the fens, and thus I got some very rare species. No poet ever felt more delighted at seeing his first poem published than I did at seeing, in Stephens' *Illustrations of British Insects*, the magic words, "captured by C. Darwin, Esq."'

The circumstance which at this time influenced his career more than any other was the friendship which now sprung up between him and Professor Henslow. During the last year and a half of his stay at Cambridge, he constantly accompanied the Professor on his walks, and in this way gained a great amount of scientific knowledge. Afterwards, at the solicitation of Professor Henslow, he was allowed to accompany Sedgwick, the geological Professor, in a private excursion to North Wales; and it was on his return home from this expedition that he found a letter awaiting him from Professor Henslow offering him the post of naturalist on board the *Beagle*, then about to start, under Captain Fitz-Roy, on a voyage for the survey of South America, and thence round the world. His father consented that he should go, and so the project of becoming a clergyman was finally broken off. 'I had been rather extravagant,' he tells us, 'at Cambridge, and to console my father, said "that I should be deuced clever to spend more than my allowance whilst on board the *Beagle*;" but he answered with a smile, "But they tell me you are very clever."' The old physician's view of his son's future was evidently improving since the time when he prophesied he should only be a good-for-nothing.

A little anecdote of this appointment cannot be omitted. 'Next day,' says Darwin, 'I started for Cambridge to see Henslow, and thence to London to see Fitz-Roy, and all was soon arranged. Afterwards, on becoming very intimate with Fitz-Roy, I heard that I had run a very narrow risk of being rejected on account of the shape of my nose. He was an ardent disciple of Lavater, and was convinced that he could judge of a man's character by the outline of his features; and he doubted whether any one with my nose could possess sufficient energy and determination for the voyage. But I think he was afterwards well satisfied that my nose had spoken falsely.'

The voyage with the *Beagle* extended from December 1831 to October 1836. The account which Darwin published of it after his return is too well known to require any characterisation

here. No one who has read this charming book will readily forget the happy mingling of observation and reflection which has rendered it so long one of the author's most popular books. Darwin himself says: 'The success of this my first literary child always tickles my vanity more than that of any of my other books. Even to this day it sells steadily in England and the United States, and has been translated for the second time into German, and into French and other languages. Ten thousand copies have been sold in England of the second edition.'

We cannot notice in detail the various scientific papers, as well as longer treatises, which appeared subsequently from the same pen, but must hasten on to the publication of his great work, *The Origin of Species*, which was issued in November 1859. Those of our readers who are old enough to recollect the public events of 1860, will remember the extraordinary excitement which prevailed in intellectual circles over the views put forward in that work. The book was assailed by men of science, and by men who knew nothing of science; it was the object of angry denunciation from a hundred platforms and in the pages of a hundred reviews; and its theories were alternately made matter of laughter and of scorn. Scarcely a voice was raised in its defence; and if raised, could not be heard amid the wild clamour of contending assailants. The state of feeling then exhibited resembled that which had been witnessed twenty-five years before, when first *The Vestiges of Creation* was published. Both books had a certain relation to the same subject. *The Vestiges*—published anonymously, but since acknowledged to be the work of the late Dr Robert Chambers—was in some respects the forerunner of the *Origin*. It is, we daresay, frequently supposed that the question of Evolution began with the publication of Darwin's book in 1859; but this was not so. Lamarck, in the beginning of the century, had thrown doubts upon the immutability of species; but his book excited little notice. In the *Vestiges*, however, a stronger note was struck in the doctrine of Progressive Development therein advocated, and enforced with many facts and much close reasoning. Darwin, referring to this book in his introduction to the *Origin*, spoke of its 'brilliant and powerful style,' and expressed his belief that, in its later editions, it 'did excellent service in this country in calling attention to the subject, in removing prejudice, and in thus preparing the ground for the reception of analogous views.' Darwin differed from his predecessors in that he put forward a hypothetical reason for the transmutation of species, namely, his doctrine of Natural Selection, or, as Mr Herbert Spencer prefers to call it, the 'survival of the fittest.' It is around this—Darwin's great theory—that the battle of the species has since 1859 been fought.*

Darwin says of his book, *The Origin of Species*: 'It is no doubt the chief work of my life. It

* It would be out of place to enlarge here on the particular points regarding which Darwin and his predecessors agreed and disagreed; but readers who wish to understand the subject will find it clearly set forth in Professor Nicholson's *Natural History: Its Rise and Progress in Britain, as developed in the Life and Labours of Leading Naturalists*. (W. & R. Chambers, 1886.)

was from the first highly successful. The first small edition of twelve hundred and fifty copies was sold on the day of publication, and a second edition of three thousand copies soon afterwards. Sixteen thousand copies have now (1876) been sold in England; and considering how stiff a book it is, this is a large sale. It has been translated into every European tongue, even into such languages as Spanish, Bohemian, Polish, and Russian. Up to the time of his death, which took place in April 1882, Darwin's name was kept continually before the scientific world, not only by discussions regarding his central theory, but by his further published works on the Descent of Man, on Insectivorous Plants, on Earthworms, and other subjects, all of which were treated with his accustomed fullness of observation and sagacity of deduction. All this work, it must not be forgotten, was accomplished by a man who was almost constantly in a state of health little removed from that of an invalid.

We could have wished, had space permitted, to give some description of certain other aspects of Darwin's life—his extreme difficulty in composition; his deficient linguistic faculty; his disregard of literature and of books, as such; his extraordinary self-absorption in his work; his great respect for the opinion of the scientific few, and his indifference to that of the unlearned many; as well as the more pleasant subject of his character and habits in private life. But space forbids. We can only refer our readers for themselves to the three delightful volumes in which Mr Francis Darwin has allowed his father mainly to tell his own life by means of his autobiography and his letters.

THIS MORTAL COIL.

CHAPTER VI.—WHICH LADY?

HUGH found the day among the sandhills simply delightful. He had said with truth he loved all innocent pleasures, for his was one of those sunny, many-sided, æsthetic natures, in spite of its underlying tinge of pessimism and sadness, that throw themselves with ardour into every simple country delight, and find deep enjoyment in trees and flowers and waves and scenery, in the scent of new-mown hay and the song of birds, and in social intercourse with beautiful women. Warren Relf had readily enough fallen in with Hugh's plan for their day's outing; for Warren Relf in his turn was human too, and at a first glance he had been greatly taken with Hugh's pretty cousin, the dark-eyed Girtton girl. His possession of the *Mud-Turtle* gave him for the moment a title to respect, for a yacht's a yacht, however tiny. So he took them all up together in the yawl to the foot of the sandhills; and while Mrs Meysey and the girls were unpacking the hamper and getting lunch ready on the white slopes of the drifted dunes, he sat down by the shore and sketched a little bit of the river foreground that exactly suited his own peculiar style—an islet of mud, rising low from the bed of the sluggish stream, crowned with purple sea-aster and white-flowered scurvy-grass, and backed by a slimy bed of tidal ooze, that shone with glancing rays of gold and crimson in the broad flood of the reflected sunlight.

Elsie was very happy, too, in her way; for had she not Hugh all the time by her side, and was she not wearing the ardent verses she had received from him by post that very morning, inside her dress, pressed close against her heart, and rising and falling with every pulse and flutter of her bosom? To him, the handicraftsman, they were a mere matter of ocean and potion, and lotion and devotion, strung together on a slender thread of pretty conceit; but to her, in the innocent ecstasy of a first great love, they meant more than words could possibly utter.

She could not thank him for them; her pride and delight went too deep for that; and even were it otherwise, she had no opportunity. But once, while they stood together by the sounding sea, with Winifred by their side, looking critically at the picture Warren Relf had sketched in hasty outline, and begun to colour, she found an occasion to let the poet know, by a graceful allusion, she had received his little tribute of verse in safety. As the painter with a few dainty strokes filled in the floating iridescent tints upon the sunlit ooze, she murmured aloud, as if quoting from some well-known poem:

Red strands that faintly fleck and spot
The tawny flood thy banks enfold;
A web of Tyrian purple, shot
Through cloth of gold.

Hugh looked up at her appreciatively with a smile of recognition. They were his own verses, out of the *Ballade of the Char* he had written and posted to her the night before. 'Mere faint Swinburnian echoes, nothing worth,' he murmured low in a deprecating aside; but he was none the less flattered at the delicate attention, for all that. 'And how clever of her, too,' he thought to himself with a faint thrill, 'to have pieced them in so deftly with the subject of the picture! After all, she's a very intelligent girl, Elsie! A man might go farther and fare worse—if it were not for that negative quantity in doits and stivers.'

Warren Relf looked up also with a quick glance at the dark-eyed girl. 'You're right, Miss Challoner,' he said, stealing a lover's side-look at the iridescent peacock hues upon the gleaming mud. 'It shines like opal. No precious stone on earth could be lovelier than that. Few people have the eye to see beauty in a flat of tidal mud like the one I'm painting; but cloth of gold and Tyrian purple are the only words one could possibly find to express in fit language the glow and glory of its exquisite colouring. If only I could put it on canvas now, as you've put it in words, even the Hanging Committee of the Academy, I believe—hard-hearted monsters—would scarcely be stony enough to dream of rejecting it.'

Elsie smiled. How every man reads things his own way, by the light of his own personal interests! Hugh had seen she was trying to thank him unobtrusively for his copy of verses; Warren Relf had only found in her apt quotation a passing criticism on his own little water-colour.

After lunch, the two seniors, the Squire and Mrs Meysey, manifested the distinct desire of middle age for a quiet digestion in the shade of the sandhills; and the four younger folks, nothing

loth to be free, wandered off in pairs at their own sweet will along the bank of the river. Hugh took Elsie for his companion at first, while Warren Relf had to put himself off for the time being with the blue-eyed Winifred. Now, Relf hated blue eyes. 'But we must arrange it like a set of Lancers,' Hugh cried with a languid wave of his graceful hand; 'at the end of the figure, set to corners and change partners.' Elsie might have felt half jealous for a moment at this equitable suggestion, if Hugh hadn't added to her in a lower tone and with his sweetest smile: 'I mustn't monopolise you all the afternoon, you know, Elsie; Relf must have his innings too; I can see by his face he's just dying to talk to you.'

'I'd rather, a great deal, talk with you, Hugh,' Elsie murmured gently, looking down at the sands with an apparently sudden geological interest in their minute composition.

'I'm proud to hear it; so would I,' Hugh answered gallantly. 'But we mustn't be selfish. I hate selfishness. I'll sacrifice myself by-and-by on the altar of fraternity to give Relf a turn in due season. Meanwhile, Elsie, let's be happy together while we can. Moments like these don't come to one often in the course of a lifetime. They're as rare as rubies and as all good things. When they do come, I prize them far too much to think of wasting them in petty altercation.'

They strolled about among the undulating dunes for an hour or more, talking in that vague emotional way that young men and maidens naturally fall into when they walk together by the shore of the great deep, and each very much pleased with the other's society, as usually happens under similar circumstances. The dunes were indeed a lovely place for flirting in, as if made for the purpose—high billowy hillocks of blown sand, all white and firm, and rolling like chalk downs, but matted together under foot with a tussocky network of spurs and campsions and soldanella convolvulus. In the tiny combs, and valleys in between, where tall reed-like grasses made a sort of petty imitation jungle, you could sit down unobserved under the lee of some mimic range of mountains, and take your ease in an enchanted garden, like sultans and sultanats of the *Arabian Nights*, without risk of intrusion. The sea tumbled in gently on one side upon the long white beach; the river ran on the other just within the belt of blown sandhills; and wedged between the two, in a long line, the barrier ridge of miniature wolds stretched away for miles and miles in long perspective towards the southern horizon. It was a lotus-eating place to lie and dream and make love in for ever. As Hugh sat there idly with Elsie by his side under the lee of the dunes, he wondered the Squire could ever have had the bad taste to object to the generous east wind which had overwhelmed his miserable utilitarian salt-marsh pastures with this quaint little fairyland of tiny knolls and Lilliputian valleys. For his own part, Hugh was duly grateful to that unconscious atmospheric landscape gardener for his admirable additions to the flat Suffolk scenery; he wanted nothing better or sweeter in life than to lie here for ever stretched at his ease in the sun, and talk of poetry and love with Elsie.

At the end of an hour, however, he roused himself sturdily. Life, says the philosopher, is not all beer and skittles; nor is it all poetry and dalliance either. 'Stern duty sways our lives against our will,' say the *Echoes from Callimachus*. It's all very well, at odd moments, to sport with Amaryllis in the shade, or with the tangles of Neera's hair—for a reasonable period. But if Amaryllis has no money of her own, or if Neera is a penniless governess in a country-house, the wise man must sacrifice sentiment at last to solid advantages; he must quit Amaryllis in search of Phyllis, or reject Neera in favour of Vera, that opulent virgin, who has lands and houses, messuages and tenements, stocks and shares, and is a ward in Chancery. Face to face with such a sad necessity, Hugh now found himself. He was really grieved that the circumstances of the case compelled him to tear himself unwillingly away from Elsie, he was so thoroughly enjoying himself in his own pet way; but duty, duty—duty before everything! The slave of duty jumped up with a start.

'My dear child,' he exclaimed, glancing hastily at his watch, 'Relf will really never forgive me. I'm sure it's time for us to set to corners and change partners. Not, of course, that I want to do it myself. For two people who are not engaged, I think we've had a very snug little time of it here together, Elsie. But a bargain's a bargain, and Relf must be inwardly grinding his teeth at me.—Let's go and meet them.'

Elsie rose more slowly and wistfully. 'I'm never so happy anywhere, Hugh,' she said with a lingering cadence, 'as when you're with me.'

'And yet we are not engaged,' Hugh went on in a meditative murmur—'we're not engaged. We're only cousins! For mere cousins, our cousinly solicitude for one another's welfare is truly touching. If all families were only as united as ours, now! interpreters of prophecy would not have far to seek for the date of the millennium. Well, well, instructress of youth, we must look out for these other young people; and if I were you, experience would suggest to me the desirability of not coming upon them from behind too unexpectedly or abruptly. A fellow-feeling makes us wondrous kind. Relf is young, and the pretty pupil is by no means unattractive.'

'I'd trust Winifred as implicitly'—Elsie began, and broke off suddenly.

'As you'd trust yourself,' Hugh put in, with a little quiet irony, completing her sentence. 'No doubt, no doubt; I can readily believe it. But even you and I—who are staid and older, and merely cousins—wouldn't have cared to be disturbed too abruptly just now, you know, when we were pulling soldanellas to pieces in concert in the hollow down yonder. I shall climb to the top of the big sandhill there, and from that specular mount—as Satan remarks in *Paradise Regained*—I shall spy from afar where Relf has wandered off to with the immaculate Winifred.—Ah, there they are, over yonder by the beach, looking for pebbles or something—I suppose amber. Let's go over to them, Elsie, and change partners. Common politeness compels one, of course, to pay some attention to one's host's daughter.'

As they strolled away again, with a change of partners, back towards the spot where Mrs Meysey was somewhat anxiously awaiting them, Hugh

and Winifred turned their talk casually on Elsie's manifold charms and excellences. 'She's a sweet, isn't she?' Winifred cried to her new acquaintance in enthusiastic appreciation. 'Did you ever in your life meet anybody like her?'

'No, never,' Hugh answered with candid praise. Candour was always Hugh's special cue. 'She's a dear, good girl, and I like her immensely. I'm proud of her too. The only inheritance I ever received from my family is my cousinship to Elsie; and I duly prize it as my sole heirloom from fifty generations of penniless Massingers.'

'Then you're very fond of her, Mr Massinger?'

'Yes, very fond of her. When a man's only got one relative in the world, he naturally values that unique possession far more than those who have a couple of dozen or so of all sexes and ages, assorted. Some people suffer from too much family; my misfortune is that, being a naturally affectionate man, I suffer from too little. It's the old case of the one ewe lamb; Elsie is to me my brothers and my sisters, and my cousins and my aunts, all rolled into one, like the supers at the theatre.'

'And are you and she'—Winifred began timidly. All girls are naturally inquisitive on that important question.

Hugh broke her off with a quick little laugh. 'Oh, dear no, nothing of the sort,' he answered hastily, in his jaunty way. 'We're not engaged, if that's what you mean, Miss Meysey; nor at all likely to be. Our affection, though profound, is of the brotherly and sisterly order only. It's much nicer so, of course. When people are engaged, they're always looking forward with yearning and longing and other unpleasant internal feelings, much enlarged upon in Miss Virginia Gabriel's songs, to a delusive future. When they're simply friends, or brothers and sisters, they can enjoy their friendship or their fraternity in the present tense, without for ever gazing ahead with wistful eyes towards a distant and ever receding horizon.'

'But why need it recede?' Winifred asked innocently.

'Why need it recede? Ah, there you pose me. Well, it needn't, of course, among the rich and the mighty. If people are swells, and amply provided for by their godfathers and godmothers at their baptism, or otherwise, they can marry at once; but the poor and the struggling—that's Elsie and me, you know, Miss Meysey—the poor and the struggling get engaged foolishly, and hope and hope for a humble cottage—the poetical cottage, all draped with roses and wild honeysuckle, and the well-attired woodbine—and toil and moil and labour exceedingly, and find the cottage receding, receding, receding still, away off in the distance, while they plough their way through the hopeless years, just as the horizon recedes for ever before you when you steer straight out for it in a boat at sea. The moral is—poor folk should not indulge in the luxury of hearts, and should wrap themselves up severely in their own interests, till they're wholly and utterly and irretrievably selfish.'

'And are you selfish, I wonder, Mr Massinger?'

'I try to be, of course, from a sense of duty; though I'm afraid I make a very poor hand at it.

I was born with a heart, and do what I will, I can't quite stifle that irrepressible natural organ.—But I take it all out, I believe, in the end, in writing verses.'

'You sent Elsie some verses this morning,' Winifred broke out in an artless way, as if she were merely stating a common fact of every-day experience.

Hugh had some difficulty in suppressing a start, and in recovering his composure so as to answer unconcernedly: 'Oh, she showed them to you, then, did she?' (How thoughtless of him to have posted those poor rhymes to Elsie, when he might have known beforehand she would confide them at once to Miss Meysey's sympathetic ear!)

'No, she didn't show them to me,' Winifred replied, in the same careless, easy way as before. 'I saw them drop out of the envelope, that's all; and Elsie put them away as soon as she saw they were verses; but I was sure they were yours, because I know your handwriting—Elsie's shown me bits of your letters sometimes.'

'I often send copies of my little pieces to Elsie before I print them,' Hugh went on casually, in his most candid manner. 'It may be vain of me, but I like her to see them. She's a capital critic, Elsie; women often are: she sometimes suggests to me most valuable alterations and modifications in some of my verses.'

'Tell me these ones,' Winifred asked abruptly, with a little blush.

It was a trying moment. What was Hugh to do? The verses he had actually sent to Elsie were all emotion and devotion, and hearts and darts, and fairest and thou wearest, and charms and arms; amorous and clamorous chimed together like old friends in one stanza, and sorrow dispelled itself to-morrow with its usual cheerful punctuality in the next. To recite them to Winifred as they stood would be to retire at once from his half-projected siege of the pretty little heiress's heart and hand. For that decisive step Hugh was not at present entirely prepared. He mustn't allow himself to be beaten by such a scholar's mate as this. He cleared his throat, and began boldly on another piece, ringing out his lines with a sonorous lilt—a set of silly, garrulous, childish verses he had written long since, but never published, about some merry sea-elves in an enchanted submarine fairy country:

A tiny fay
At the bottom lay
Of a purple bay
Unruffled,
On whose crystal floor
The distant roar
From the surf-bound shore
Was muffled.

With his fairy wife
He passed his life
Undimmed by strife
Or quarrel;
And the livelong day
They would merrily play
Through a labyrinth gay
With coral.

They loved to dwell
In a pearly shell,
And to deck their cell
With amber;

Or amid the caves
That the ripple laves
And the beryl paves
To clamber.

He went on so, with his jiggling versicles, line after line, as they walked along the firm white sand together, through several foolish sing-song stanzas; till at last, when he was more than half way through the meaningless little piece, a sudden thought pulled him up abruptly. He had chosen, as he thought, the most innocent and non-committing bit of utter trash in all his private poetical repertory; but now, as he repeated it over to Winifred with easy intonation, swinging his stick to keep time as he went, he recollected all at once that the last rhymes flew off at a tangent to a very personal conclusion—and what was worse, were addressed, too, not to Elsie, but very obviously to another lady! The end was somewhat after this wise:

On a darting shrimp,
Our quaint little imp
With bridle of gimp
Would gambol;
Or across the back
Of a sea-horse black,
As a gentleman's hack
He'd amble.

Of emerald green
And sapphire's sheen
He made his queen
A tiar;
And the merry two
Their whole life through
Were as happy as you
And I are.

And then came the seriously compromising bit:

But if you say
You think this lay
Of the tiny fay
Too silly,
Let it have the praise
My eye betrays
To your own sweet gaze,
My Lily.

For a man he tries,
And he toils and sighs
To be very wise
And witty;
But a dear little dame
Has enough of fame
If she wins the name
Of pretty.

Lily! Lily! Oh, that discomposing, unfortunate, compromising Lily! He had met her down in Warwickshire two seasons since, at a country-house where they were both staying, and had fallen over head and ears in love with her—then. Now, he only wished with all his heart and soul she and her fays were at the bottom of the sea in a body together. For of course she was penniless. If not, by this time she would no doubt have been Mrs Massinger.

Hugh Massinger was a capital actor; but even he could hardly have ventured to pretend, with a grave face, that those Lily verses had ever been addressed to Elsie Challoner. Everything depended upon his presence of mind and a bold resolve. He hesitated for a moment at the 'emerald green and sapphire's sheen,' and seemed as though he couldn't recall the next line. After

a minute or two's pretended searching he recovered it feebly, and then he stumbled again over the end of the stanza.

'It's no use,' he cried at last, as if angry with himself. 'I should only murder them if I were to go on now. I've forgotten the rest. The words escape me. And they're really not worth your seriously listening to.'

'I like them,' Winifred said in her simple way. 'They're so easy to understand: so melodious and meaningless. I love verse that you don't have to puzzle over. I can't bear Browning for that—he's so impossible to make anything sensible out of. But I adore silly little things like these, that go in at one ear and out of the other, and really sound as if they meant something.—I shall ask Elsie to tell me the end of them.'

Here was indeed a dilemma! Suppose she did, and suppose Elsie showed her the real verses! At all hazards, he must extricate himself somehow from this impossible situation.

'I wish you wouldn't,' he said gently, in his softest and most persuasive voice. 'Elsie mightn't like you to know I sent her my verses—though there's nothing in it—girls are so sensitive sometimes about these matters.—But I'll tell you what I'll do, if you'll kindly allow me: I'll write you out the end of them when I get home to the inn, and bring them written out in full, a nice clear copy, the next time I have the pleasure of seeing you.' ('I can alter the end somehow,' he thought to himself with a sudden inspiration, 'and dress them up innocently one way or another with fresh rhymes, so as to have no special applicability of any sort to anybody or anything anywhere in particular.')

'Thank you,' Winifred replied, with evident pleasure. 'I should like that ever so much better. It'll be so nice to have a poet's verses written out for one's self in his own handwriting.'

'You do me too much honour,' Hugh answered with his mock little bow. 'I don't pretend to be a poet at all; I'm only a versifier.'

They joined the old folks in time by the yawl. The Squire was getting anxious to go back to his garden now—he foresaw rain in the sky to westward.

Hugh glanced hastily at his watch with a sigh. 'I must be going back too,' he cried. 'It's nearly five now; we can't be up at the village till six. Post goes out at nine, they say, and I have a book to review before post-time. It must positively reach town not later than to-morrow morning. And what's worse, I haven't yet so much as begun to dip into it.'

'But you can never read it and review it too in three hours!' Winifred exclaimed, aghast.

'Precisely so,' Hugh answered, in his jaunty way, with a stifled yawn; 'and therefore I propose to omit the reading as a very unnecessary and wasteful preliminary. It often prejudices one against a book to know what's in it. You approach a work you haven't read with a mind unbiassed by preconceived impressions. Besides, this is only a three-volume novel: they're all alike; it doesn't matter. You can say the plot is crude and ill-constructed, the dialogue feeble, the descriptions vile, the situations borrowed, and the characters all mere conventional puppets. The same review will do equally well for the whole stupid lot of them. I usually follow

Sydney Smith's method in that matter: I cut a few pages at random, here and there, and then smell the paper-knife.'

'But is that just?' Elsie asked quietly, a slight shade coming over her earnest face.

'My dear Miss Challoner,' Warren Relf put in hastily, 'have you known Massinger so many years without finding out that he's always a great deal better than he himself pretends to be? I know him well enough to feel quite confident he'll read every word of that novel through to-night, if he sits up till four o'clock in the morning to do it; and he'll let the London people have their review in time, if he telegraphs up every blessed word of it by special wire to-morrow morning. His wickedness is always only his brag; his goodness he hides carefully under his own extremely capacious bushel.'

Hugh laughed. 'As you know me so much better than I know myself, my dear boy,' he replied easily, 'there's nothing more to be said about it. I'm glad to receive so good a character from a connoisseur in human nature. I really never knew before what an amiable and estimable member of society hid himself under my rugged and unprepossessing exterior.' And as he said it, he drew himself up, and darting a laugh from the corner of those sad black eyes, looked at the moment the handsomest and most utterly killing man in the county of Suffolk.

When Elsie and Winifred went up to their own rooms that evening, the younger girl slipping into Elsie's bedroom for a moment, took her friend's hands tenderly in her own, and looking long and eagerly into the other's eyes, said at last in a quick tone of unexpected discovery: 'Elsie, he's awfully nice-looking and awfully clever, this Oxford cousin of yours. I like him immensely.'

Elsie brought back her eyes from infinity with a sudden start. 'I'm glad you do, dear,' she said, looking down at her kindly. 'I wanted you to like him. I should be dreadfully disappointed, in fact, if you didn't. I'm exceedingly fond of Hugh, Winnie.'

Winifred paused for a second significantly; then she asked point-blank: 'Elsie, are you engaged to him?'

'Engaged to him! My darling, what ever made you dream of such a thing?—Engaged to Hugh!—engaged to Hugh Massinger!—Why, Winnie, you know he's my own cousin.'

'But you don't answer my question plainly,' Winifred persisted with girlish determination. 'Are you engaged to him or are you not?'

Elsie, mindful of Hugh's frequent declarations, answered boldly (and not quite untruthfully): 'No, I'm not, Winifred.'

The heiress of Whitestrand stroked her friend's hair with a sigh of relief. That sigh was blind. Girl though she was, she might clearly have seen with a woman's instinct that Elsie's flushed cheek and downcast eyes belied to the utmost her spoken word. But she did not see it. All preoccupied as she was with her own thoughts and her own wishes, she never observed at all those mute witnesses to Elsie's love for her handsome cousin. She was satisfied in her heart with Hugh's and Elsie's double verbal denial. She said to herself with a thrill in her own soul, as a girl will do

in the first full flush of her earliest passion: 'Then I may love him if I like! I may make him love me! It won't be wrong to Elsie for me to love him!'

(To be continued.)

IS DEATH FROM INTENSE COLD PAINLESS?

WHAT strange vicissitudes are represented in the history of some men's lives! Who would have thought, after such an unusually active and public life as that of the late Rev. A. H. Mackonochie, that his last hours would be spent in a lonely Scotch glen, with no human eye to watch him—only guarded by the faithful dogs that stood by him to the last, and until long after he, overcome by fatigue and cold, had calmly yielded his much-tried soul into the hands of the Father of spirits? A thrill of pity passed through many a heart as the eye read the first meagre account of the placid face, the shoeless foot, and the pure-white covering of snow. Did the weary one suffer much or any pain during the last few hours of his life? Did he endure the same agony which Thomson created for his victim in the justly celebrated storm-scene in *Winter*? Or did the calm face reflect a deeper quiet of soul, a foretaste of bliss? Is it possible to set at rest any disturbing doubts on the question? The present writer, having had a providential escape from death amidst Alpine snows, can give an answer which will probably allay any fears on the point.

Like other hard-working people, I enjoy a holiday; but a real holiday to me must have two excellent qualities: one, a total absence of responsibility; the other, it must be amongst mountains; and whether these be Scotch mountains, the Alps, the Pyrenees, or any others, I do not mind very much, so that I can get up somewhere as far as possible out of that world of encumbrances which pertain to a literary man's life—to wit, pens, papers, ink, pamphlets, books of all kinds, letters, and worse than all, these obtrusive barbarously brown telegram envelopes and all their contents. But these form what I may call still-life. There is something worse, if the oppressive cares which are in reality the graver part of life, must be handed over to a deputy who has possessed himself of your probable route. To be in a perpetual state of uncertainty as to what a day may bring forth, when you really want nothing, is only a mild alternative to doing the thing one's self. But if you want to gain tone and elasticity of body, of mind, and of feelings too, and really enjoy perfect freedom, get away out of the ruts of life, as far as you can from all beaten tracks, and as high up as you can, and every day will make a difference.

Again, tastes vary considerably in another direction. The last travelling companion I had was on the continent nearly twenty years ago. He thought, after some weeks of travel, that mountains were made for mountain maniacs, and that he had had his fill. Moreover, he could not walk more than a score of miles per day; nor did he care much about the ten thousand beauties of nature which enchant a lover of botany,

geology, entomology, and the like. Ever since then, I have gone alone; besides, there are times when even the most desirable companion is a little too much; I mean, during those supreme moments of life such as are so wondrously expressed in many of Wordsworth's poems.

I was enjoying something of such a holiday in the Pennine Alps, a few years ago. Of course, I was alone. If any contrast were needed, there was one offered in the abominations of the Rhone Valley, where any one with a sensitive epidermis understood very soon the qualities of the gnats, mosquitoes, and the rest of the flying plagues. After this, to go to a quiet place outside Chamouni for a week or two, avoiding the noisy hotels, and enjoy the charms of the Monarch of the Alps and his environs, is a different matter altogether.

On the particular occasion referred to, I started from Martigny at six A.M., and intended to traverse the thirty miles to the Hospice of the Great St Bernard before night. As I was following one of my holiday pursuits of butterfly-catching, it need hardly be said that, as those 'winged flying flowers' had a considerable choice of route, my journey was correspondingly lengthened. Frequently, some beauty tempted me to run a few hundred yards exactly in the wrong direction, then dodging over some inaccessible spot, was lost to me. The day was a scorching one; even the rocks reflected the intense heat, and combining with the white dust of the roads, made the first twenty miles unpleasant travelling. Time being of consequence, I thought it prudent, so as to get to the summit of the pass before dark, not to stop for a meal to be cooked at Orsières or Liddes, but pressed forward to the last place before the snow-tramp commenced, the *Cantine de Proz*. There I met with a young nobleman and his guide. After an interchange of inquiries, and an offer on my part of some chocolate and biscuits to the other travellers, as the *Cantine* was hard up that day in eatables, we set out together, and had crossed the Plan de Marengo without any presentiment of what was going to happen. The first indication of something wrong was the peculiar appearance which my surroundings seemed to assume. Everything looked hazy to my vision—even the snow and the rocks lying about looked as if enveloped in a fog, although the afternoon was beautifully clear. Then I felt that I must sit down and enjoy it; but the guide's flask of *Kirschwasser* set me going again. Very soon, however, the former feeling returned; but the same treatment temporarily recovered me. At last I took to stumbling along, fell down several times, and at length could not help myself. My companions urged me in vain to arouse to one more effort; but it was useless.

The guide's experience was now of the utmost service. Divining the exact state of the case, and what might happen, he took a very sensible course. Leaving the marquis to see to me, he hurried forward to meet the two monks who always came down from the Hospice at a particular hour each day, so as to obtain their efficient help. On their arrival, the marquis either went on, on his own account, or was requested to go forward with the news. Anyhow, I was informed the next day that his report was, that 'Monsieur le — had perished in the snows.' In the meantime the two monks and guide took me in

hand, and shaking me up, made my hands clasp a belt round the guide's waist, and each of the monks took an arm. The former acted as a substitute for horse-power, and the two latter as wheels. As for myself, I was fast becoming a dead-weight. Between the *Cantine* and the Hospice there is a space of seven and a half miles of very rough walking, uphill of course, and with a depth of several feet of snow where the *cantonniers* had not cleared a path. I suspect that my deliverers had a very difficult task, over at least five miles, to keep me from getting into that sleep from which there is no waking. The sensations of that journey during occasional gleams of consciousness will never be erased from my mind. Is there such an essence of ecstatic delight as *élixir mortis*? If there is, it must have been something like it, or the very thing itself, which I enjoyed that day. No words can possibly express the surpassing desire which I felt to sit down and enjoy my felicity—and sleep. But my inexorable friends knew that sleep meant death; and though my repeated appeals of 'Doucement, doucement' were plaintive enough, they were met by redoubled efforts to force me onwards, even when my own legs would not move any longer. The collapse was complete. After the long hot day, the additional distances which the butterflies had added to the thirty miles, and the abstention from a good meal since five A.M., it can readily be understood how the intense cold, which immediately follows after the sun is lost to view on the other side of the giant mountains, seized hold of every vital, muscle, and nerve, and very nearly claimed the victim beyond recall. I may add that, though the month was July, the frost at night was so great as to send the thermometer down nearly to zero.

During the sustained efforts of the three men, I had but momentary glimpses of consciousness. I remember seeing two somethings, black, one on each side, but very indistinct. These of course were the friendly monks. The one overwhelming idea that filled my mind then was how to get to that sleep, that blissful euthanasia which poets have sung about, but which my companions were doing their best to rob me of, just when I had got it within my grasp.

Another lucid interval occurred just as we approached the door of the Hospice, for I saw two or three of the dogs; and then I was lost again, till I found myself in the large room, surrounded by several of the canons. One administered some Extract of Orange Flowers, and that was followed by some warm broth. Then another tugged off my boots, socks, &c.; and between them, somehow or other, they got me into bed. (This particular room would not have been mine, if I had gone as an ordinary traveller usually does. I am under the impression that it was looked upon as the best bedroom, being the one used by Napoleon Bonaparte when he stopped at the Hospice *en route* to the Italian campaign.) In the night, I woke, breathing very quickly and very hard. The room itself had the appearance of being one mass of cotton-wool. Congestion of the lungs had got hold of me now, and I felt very ill indeed. But, however, the next morning I did what the monks had ineffectually tried to impress upon

me the night before, and I made an effort. My first duty to others was to see the excellent guide and make him a due acknowledgment; and as the noble and heroic monks, who live only for others, would not hear of anything but thanks, I had recourse to the *tronc* of the church. To the three men, I am, humanly speaking, indebted for my life. A grateful heart never need be ashamed of its precious burden.

Then, curiosity drew my steps outside the Hospice to visit the Morgue. I expect that very few have had such weighty cause for looking at that very strange building with such peculiar feelings as I did on that occasion; for there, in all probability, I should have been consigned to keep company with the many other members of that unburied guild of death. It is not essential for me to describe what has been so frequently written about; everybody knows about the weird sights of that remarkable habitation of the dead. But when I saw it, those standing figures, men stricken with death as if in the act of listening to a possible sound of voices, or straining to get another glint of an approaching light, had only been put there a few months before—they, and the sight of others huddled up with their heads on their knees, and any quantity of remains, bones, and clothes, are engraved on my mind most vividly. It is all realistic enough to the very last degree. At all times, the touch of a hand that is still in death is like nothing else; and though I have seen other Morgues and other awful sights, the one on the Great St Bernard Pass has fitted itself to my memory as distinctly as scenes only of yesterday. Even the trivial incidents are here at hand again—Turco with a bone; what bone? and Pluton growling at him; the pretty little Soldanella trying to push its little lavender-coloured parachute through the snow, to keep company with the cushioned Gentian and the graceful Arabis. And can I forget the old *cantonnier*, who, when strength had returned to my limbs, and I had wielded his pick and shovel removing snow, thankfully received my coin as I paid for my invasion of his duty, on purpose to teach him some other and higher truth? Or that half-witted kineherd who had not a shred of intelligence about him till I gave him a few *centesimi*, and for the same purpose? But chiefly, yes, above all, the transcendent kindness of the *clavandier* of the monastery deserves record? His personal attention was unremitting—in fact, it was from him that I learnt more than I knew before what an unusual case mine had been, and that recovery had but seldom rewarded their efforts under similar circumstances. Hence the day in my holiday notes is rightly headed, ‘an eventful day.’

When I commenced this paper, my idea was to compare that intense longing for sleep with another incident of a far more appalling nature, when, with intense vividness of sight, I was hurling down the snow-slopes of a mountain near Monte Rosa right into the jaws of death. But I must hark back to the title—‘Is death from intense cold painless?’ I have stated the circumstances which led up as causes to my discomfiture—what my delighted feelings were—how I longed to be let alone, so as to enjoy that delicious euthanasia. And I have told my story

in order to help others to hope that, in the case of Mr Mackonochie and of many a one besides who may have perished like him, death from intense cold may be at all events *painless*.

THE GOLDEN INCUBUS.

CHAPTER X.—A PECULIAR POSITION.

THE prisoner had been sitting upon the sawdust about an hour, when the door opened again, and the two men entered, one bearing a bundle of blankets and a couple of pillows, the other a tray with a large cup of hot coffee and a plate of bread and butter.

‘There, you see we shan’t starve you,’ said the first man; ‘and you can make yourself a bed with these when you’ve done.’

‘Will you leave me a light?’

‘No,’ says the man with a laugh. ‘Wild sort of lads like you are not fit to trust with lights. Good-night.’

The door of the inner cellar was closed and bolted, for it was not like ours, a simple arch; and then the outer cellar door was shut as well; and Mr Barclay sat for hours reproaching himself for his infatuation, before, wearied out, he lay down and fell asleep. How the time had gone, he could not tell, but he woke up suddenly, to find that there was a light in the cellar, and the two men were looking down at him.

‘That’s right—wake up,’ says the principal speaker, ‘and put on those.’

‘But’—began Mr Barclay, as the man pointed to some rough clothes.

‘Put on those togs, confound you!’ cried the fellow fiercely, ‘or’—

He tapped the butt of a pistol; and there was that in the man’s manner which showed that he was ready to use it.

There was nothing for it but to obey; and in a few minutes the prisoner stood up unbound and in regular workman’s dress.

‘That’s right,’ said his jailer. ‘Now, come along; and I warn you once for all, that if you break faith and attempt to call out, you die, as sure as your name’s Barclay Drinkwater!’

Mr Barclay felt as if he was stunned; and, half led, half pushed, he was taken into what had once been the pantry, but was now a curious-looking place, with a bricked round well in the middle, while on one side was fixed a large pair of blacksmith’s forge bellows, connected with a zinc pipe which went right down into the well.

‘What does all this mean?’ he said. ‘What are you going to do?’

‘Wait, and you’ll see,’ was all the reply he could get; and he stared round in amazement at the heaps of new clay that had been dug out, the piles of old bricks which had evidently been obtained by pulling down partition walls somewhere in the house, the lower part of which seemed, as it were, being transformed by workmen. Lastly, there were oil-lamps and a pile of cement, the material for which was obtained from a barrel marked ‘Flour.’

The man called Ned was better, and joined them there, the three being evidently prepared for work, in which Mr Barclay soon found that he was to participate, and at this point he made a stand.

'Look here,' he said; 'I demand an explanation. What does all this mean?'

'Are you ready for work?' cried the leader of the little gang, seizing him by the collar menacingly.

'You people have obtained possession of this house under false pretences, and you have made the place an utter wreck. I insist on knowing what it means.'

'You do—do you?' said the man, thrusting him back, and holding him with his shoulders against a pile of bricks. 'Then, once for all, I tell you this: you've got to work here along with us in silence, and hard too, or else be shut up in that cellar in darkness, and half-starved till we set you free.'

'The police shall'—

'O yes—all right. Tell the police. How are you going to do it?'

'Easily enough. I'll call for help, and'—

'Do,' said the man, taking a small revolver from his breast. 'Now, look here, Mr Drink-water; men like us don't enter upon such an enterprise as this without being prepared for consequences. They would be very serious for us if they were found out. Nobody saw you come in where you were not asked, and when you came to insult my friend's wife.'

'Wife?' exclaimed Mr Barclay, for the word almost took his breath away.

'Yes, sir, wife; and it might happen that the gallant husband had an accident with you. We can dig holes, you see. Perhaps we might put somebody in one and cover him up.—Now, you understand. Behave yourself, and you shall come to no harm; but play any tricks, and— Look here, my lads; show our new labourer what you have in your pockets.'

'Not now,' they said, tapping their breasts. 'He's going to work.'

Mr Barclay, as he used to say afterwards, felt as if he was in a dream, and without another word went down the ladder into the well, which was about ten feet deep, and found himself facing the opening of a regular egg-shaped drain, carefully bricked round, and seemingly securely though roughly made.

'Way to Tom Tiddler's ground,' said the man who had followed him.—'Now, then, take that light and this spade. I'll follow with a basket; and you've got to clear out the bricks and earth that broke loose yesterday.'

Mr Barclay looked in at the drain-like passage, which was just high enough for a man to crawl along easily, and saw that at one side a zinc pipe was carried, being evidently formed in lengths of about four feet, joined one to the other, but for what purpose, in his confused state, he could not make out.

What followed seemed like a part of a dream, in which, after crawling a long way, at first downwards, and then, with the passage sloping upwards, he found his farther progress stopped by a quantity of loose stones and crumbled down earth, upon which, by the direction of the man who followed close behind, he set down a strong-smelling oil lamp, filled the basket pushed to him, and realised for the first time in his life what must be the life of a miner toiling in the bowels of the earth.

At first it was intensely hot, and the lamp

burned dimly; but soon after he could hear a low hissing noise, and a pleasant cool stream of air began to fill the place; the heat grew less, the light burned more brightly, and he understood what was the meaning of the bellows and the long zinc tube.

For a full hour he laboured on, wondering at times, but for the most part, feeling completely stunned by the novelty of his position. He filled baskets with the clay and bricks, and by degrees cleared away the heap before him, after which he had to give place to the man who had been injured, but who now crept by both the occupants of the passage, a feat only to be accomplished after they had both lain down upon their faces.

Then the prisoner's task was changed to that of passing bricks and pails of cement, sometimes being forced to hold the light while the man deftly fitted in bricks, and made up what had been a fall, and beyond which the passage seemed to continue ten or a dozen feet.

At intervals the gang broke off work to crawl backwards out of the passage to partake of meals which were spread for them in the library. These meals were good, and washed down with plenty of spirits and water, the two servant-like women and the so-called Adela waiting on the party, everything being a matter of wonder to the prisoner, who stared wildly at the well-dressed, lady-like, girlish creature who busied herself in supplying the wants of the gang of four brick-layer-like men.

At the first meal, Mr Barclay refused food. He said that he could not eat; but he drank heartily from the glass placed at his side—water which seemed to him to be flavoured with peculiar coarse brandy. But he was troubled with a devouring thirst, consequent upon his exertions, and that of which he had partaken seemed to increase the peculiar dreamy nature of the scene. Whether it was laudanum or some other drug, we could none of us ever say for certain; but Mr Barclay was convinced that, nearly all the time, he was kept under the influence of some narcotic, and that, in a confused dreamy way, he toiled on in that narrow culvert.

He could keep no account of time, for he never once saw the light of day, and though there were intervals for food and rest, they seemed to be at various times; and from the rarity with which he heard the faint rattle of some passing vehicle, he often thought that the greater part of the work must be done by night.

At first he felt a keen sense of trouble connected with what he looked upon as his disgrace and the way he had lowered himself; but at last he worked on like some machine, obedient as a slave, but hour by hour growing more stupefied, even to the extent of stopping short at times and kneeling before his half-filled basket motionless, till a rude thrust or a blow from a brickbat pitched at him roused him to continue his task.

The drug worked well for his taskmasters, and the making of the mine progressed rapidly, for every one connected therewith seemed in a state of feverish anxiety now to get it done.

And so day succeeded day, and night gave place to night. The two servant-like women went busily on with their work, and fetched provisions for the household consumption, no tradespeople

save milkman and baker being allowed to call, and they remarked that they never once found the area gate unlocked. And while these two women, prim and self-contained, went on with the cooking and housework and kept the doorstep clean, the so-called Miss Adela Mimpriss went on with the woolwork flowers at the dining-room window, where she could get most light, and the world outside had no suspicion of anything being wrong in the staid, old-fashioned house opposite Sir John Drinkwater's. Even the neighbours on either side heard no sound.

'What does it all mean?' Mr Barclay used to ask himself, and at other times, 'When shall I wake?' for he often persuaded himself that this was the troubled dream of a bad attack of fever, from which he would awaken some day quite in his right mind. Meanwhile, growing every hour more machine-like, he worked on and on always as if in a dream.

CHAPTER XL.—CONCLUSION.

I stood watching Sir John, who seemed nearly mad with grief and rage, and a dozen times over my lips opened to speak, but without a sound being heard. At last he looked up at me and saw what I wanted to do, but which respect kept back.

'Well,' he said, 'what do you propose doing?'

I remained silent for a moment, and then, feeling that even if he was offended, I was doing right, I said to him what was in my heart.

'Sir John, I never married, and I never had a son. It's all a mystery to me.'

'Man, you are saved from a curse!' he cried fiercely.

'No, dear master, no,' I said, as I laid my hand upon his arm. 'You don't believe that. I only wanted to say that if I had had a boy—a fine, handsome, brave lad like Mr Barclay'—

'Fine!—brave!' he says contemptuously.

'Who had never done a thing wrong, or been disobedient in any way till he fell into temptation that was too strong for him'—

'Bah! I could have forgiven that. But for him to have turned thief!'

I was silent, for his words seemed to take away my breath.

'Man, man!' he cried, 'how could you be such an idiot as to write that document and leave it where it could be found?'

'I did it for the best, sir,' I said humbly.

'Best? The worst,' he cried. 'No, no; I cannot forgive. Disgrace or no disgrace, I must have in the police.'

'No, no, no!' I cried piteously. 'He is your own son, Sir John, your own son; and it is that wretched woman who has driven him mad.'

'Mad? Burdon, mad? No; it is something worse.'

'But it is not too late,' I said humbly.

'Yes, too late—too late. I disown him. He is no longer son of mine.'

'And you sit there in that dining-room every night, Sir John,' I said, 'with all us servants gathered round, and read that half a chapter and then say, "As we forgive them that trespass against us." Sir John—master—he is your own son, and I love him as if he was my own.'

There wasn't a sound in that place for a minute,

and then he drew his breath in a catching way that startled me, for it was as if he was going to have a fit. But his face was very calm and stern now, as he says to me gently: 'You are right, old friend'—and my heart gave quite a bound—'old friend.'

'Let's go to him and save him, master, from his sin.'

'Two weak old men, Burdon, and him strong, desperate, and taken by surprise. My good fellow, what would follow then?'

'I don't know, Sir John. I can only see one thing, and that is, that we should have done our duty by the lad. Let's leave the rest to Him.'

He drew a long deep breath.

'Yes,' he says. 'Come along.'

We went back in the darkness to the cellar door and listened; but all seemed very still, and I turned the key in the patent Bramah lock without a sound. We went in, and stood there on the sawdust, with that hot smell of burnt oil seeming to get stronger, and there was a faint light in the inner cellar now, and a curious rustling panting sound. We crept forward, one on each side of the opening; and as we looked in, my hand went down on one of the sherry bottles in the bin by my arm, and it made a faint click, which sounded quite loud.

I forgot all about Sir John; I didn't even know that he was there, as I stared in from the darkness at the scene before me. They—I say they, for the whispering had taught me that there was more than one—had got the stone up while we had been away. It had been pushed aside on to the sawdust, and a soft yellow light shone up now out of the hole, showing me my young master, looking so strange and staring-eyed and ghastly, that I could hardly believe it was he. But it was, sure enough, though dressed in rough workman's clothes, and stained and daubed with clay.

It wasn't that, though, which took my attention, but his face; and as I looked, I thought of what had been said a little while ago in my place, and I felt it was true, and that he was mad. He had just crept up out of the hole, when he uttered a low groan and sank down on his knees, and then fell sidewise across the hole in the floor. He was not there many moments before there was a low angry whispering; he seemed to be heaved up, and a big workman-looking fellow came struggling up till he sat on the sawdust with his legs in the hole, and spoke down to some one.

'It's all right,' he said. 'The chests are here; but the fool has fainted away. Quick! the lamp, and then the tools.'

He bent down and took a smoky oil lamp that was handed to him, and I drew a deep breath, for the sound of his voice had seemed familiar; but the light which shone on his face made me sure in spite of his rough clothes and the beard he had grown. It was Edward Gunning, our old servant, who was discharged for being too fond of drink, turned bricklayer once again.

As he took the lamp, he got up, held it above his head, looked round, and then, with a grin of satisfaction at the sight of the chests, stepped softly toward the opening into the outer cellar, where Sir John and I were watching.

It didn't take many moments, and I hardly

know now how it happened, but I just saw young Mr Barclay lying helpless on the sawdust, another head appearing at the hole, and then, with the light full upon it, Edward Gunning's face being thrust out of the opening into the cellar where we were, and his eyes gleaming curiously before they seemed to shut with a snap. For, all at once—perhaps it was me being a butler and so used to wine—my hand closed upon the neck of one of those bottles, which rose up sudden-like above my head, and came down with a crash upon that of this wretched man.

There was a crash; the splash of wine; the splintering of glass; the smell of sherry—fine old sherry, yellow seal—and I stood for a moment with the bottle neck and some sawdust in my hand, startled by the yell the man gave, by the heavy fall, and the sudden darkness which had come upon us.

Then—I suppose it was all like a flash—I had rushed to the inner cellar and was dragging the slab over the hole, listening the while to a hollow rustling noise which ended as I got the slab across and sat on it to keep it down.

'Where are you, Burdon?' says Sir John.

'Here, sir!—Quick! A light.'

I heard him hurry off; and it seemed an hour before he came back, while I sat listening to a terrible moaning, and smelling the spilt sherry and the oily knocked-out lamp. Then Sir John came in, quite pale, but looking full of fight, and the first thing he did was to stoop down over Edward Gunning and take a pistol from his breast. 'You take that, Burdon,' he said, 'and use it if we are attacked.'

'Which we shan't be, Sir John, if you help me to get this stone back in its place.'

He set the lamp on one of the chests and lent a hand, when the stone dropped tightly into its place; and we dragged a couple of chests across, side by side, before turning to young Mr Barclay, who lay there on his side as if asleep.

'Now,' says Sir John, as he laid his hand upon the young man's collar and dragged him over on to his back, 'I think we had better hand this fellow over to the police.'

'The doctor, you mean, sir. Look at him.'

I needn't have bade him look, for Sir John was already doing that.

It was a doctor that I fetched and not the police, for Mr Barclay lay there quite insensible, and smelling as if he had taken to eating opium, while Ned Gunning had so awful a cut across his temple that he would soon have bled to death.

The doctor came and dressed the rascal's wounds as he was laid in my pantry; but he shook his head over Mr Barclay, and with reason; for two months had passed away before we got him down to Dorking, and saw his pale face beginning to get something like what it was, with Miss Virginia, forgiving and gentle, always by his side.

But I'm taking a very big jump, and saying nothing about our going across to the house opposite as soon as it was daylight, to find the door open and no one there; while the state of that basement and what we saw there, and the artfulness of the people, and the labour they had given in driving that passage right under the road as true as a die, filled me with horror, and cost Sir John five hundred pounds.

Why, their measurements and calculations were

as true as true; and if it hadn't been for me missing that paper—which, of course, it was Edward Gunning who stole it—those scoundrels would have carried off that golden incubus as sure as we were alive. But they didn't get it; and they had gone off scot-free, all but our late footman, who had concussion of the brain in the hospital where he was took, Sir John saying that he would let the poor wretch get well before he handed him over to the police.

But, bless you, he never meant to. He was too pleased to get Mr Barclay back, and to find that he hadn't the least idea about the golden incubus being in the cellar; while as to the poor lad's sorrow about his madness and that wretched woman, who was Ned Gunning's wife, it was pitiful to see.

The other scoundrels had got away; and all at once we found that Gunning had discharged himself from the hospital; and by that time the house over the way was put straight, the builder telling me in confidence that he thought Sir John must have been mad to attempt to make such a passage as that to connect his property without consulting a regular business man. That was the morning when he got his cheque for the repairs, and the passage—which he called 'Drinkwater's Folly'—had disappeared.

Time went on, and the golden incubus went on too—that is, to a big bank in the Strand, for we were at Dorking now, where those young people spent a deal of time in the open air; and Mr Barclay used to say he could never forgive himself; but his father did, and so did some one else.

Who did?

Why, you don't want telling that. Heaven bless her sweet face! And bless him, too, for a fine young fellow! as strong—ay, and as weak, too, of course—as any man.

Dear, dear, dear! I'm pretty handy to eighty now, and Sir John just one year ahead; and I often say to myself, as I think of what men will do for the sake of a pretty face—likewise for the sake of gold: 'This is a very curious world.'

THE MONTH:

SCIENCE AND ARTS.

THE Bureau of Statistics in Berlin has recently issued some curious information with regard to the number of steam-engines in use in the chief countries of the world, and the amount of motive-force which they represent. The United States stand first with a total horse-power of seven and a half millions; next comes Britain with half a million less; Germany has four and a half millions; France, three millions; and Austria, a million and a half. In these figures, the motive-power of the locomotives, which number one hundred and five thousand throughout the world, is not included. They represent collectively a total of three million horse-power. Summarising these figures, and remembering that a steam horse-power is equal to the power of three actual horses, and that the strength of a living horse is equal to that of seven men, we arrive at the following result: the steam-engines of the world do the work of double its working population.

A large number of ornithologists assembled the

other day in a London saleroom to bid for the possession of an egg of the great auk; and it was finally knocked down for the sum of one hundred and sixty guineas. The reason why this sea-bird's egg commanded such a high price is found in the circumstance that there are only sixty-six eggs known to exist, and the certainty that no more will be produced. For the great auk, plentiful enough in past times, has, through its own helplessness and the greed of man, become extinct. It was, unfortunately, without the power of flight, and this not because of any structural peculiarity of its wings, but simply on account of the diminutive size of those wings relatively to the bulk and weight of the body. With a total length of about three feet, this curious biped had wings which measured but six inches in extent. The usual means of escape from its enemies were denied it, and it has ceased to exist. The last specimen of this bird seen alive was taken in the sea off St Kilda in 1821.

Like many other industries, the work of bottle-making has of late years suffered so much from foreign competition that it has almost been driven from this country, Germany and Belgium being the largest producers. It is hoped, however, that the lost industry may be again revived here, these hopes being founded upon a lately invented machine, which will turn out bottles far more expeditiously than they can be made by hand, and at a tithe of the cost. This machine is the invention of Mr Howard M. Ashley, and is being worked at the glass manufactory of Messrs Sykes, Macvay, & Co. of Castleford. In this machine the molten glass is poured into a mould, and the application of air under pressure distends the glass and causes it to fill the interior of that mould. It is believed that when this machine is complete with six or eight moulds, it will be possible by it to make twenty-four bottles per minute.

Rear-admiral Colomb, writing to the *Times* in allusion to a recent disastrous collision in the Channel, calls attention to the present very defective methods of signalling at sea, and points out how impossible it often is for one ship to ascertain the intentions of another. He mentions one thing which is not generally known—namely, that the Board of Trade forbid the mercantile marine to use that system of speech by signal which has been for a long time common to every navy in the world. He also pleads for some signal which will not only attract attention to 'distress,' but will also indicate to some extent the nature of that distress.

The North of England Institute of Mining and Mechanical Engineers some time back appointed a Committee to inquire into the suspected connection between earth-tremors and the issue of gas in mines. This Committee have recently given in their Report upon the subject. Earthquake disturbances in distant parts of the world were found to correspond in date with irregular and perturbent movements at Marsden, where the observations were made. The seismograph used in the experiments was of a somewhat imperfect kind, and it is to be replaced by a better one which has been devised by Professor Ewing of the University College, Dundee. In continuing the experiments, the return-air from the mines will be examined, with a view to note the percentage of gas which it

contains at different times. It has already been noted that on the occasion of certain earth-disturbances at the beginning of December last, there was a marked increase in the issue of gas at many collieries.

In February last, it was reported that Dr Klein had established the fact that milch cows suffered sometimes from an eruptive complaint identical with scarlet fever, and that milk from such cows would prove a source of infection for that disease. The Agricultural Department, recognising the serious import of this alleged discovery, and its probable injury to dairy-farming, instructed Professor Crookshank, of the Bacteriological Laboratory at King's College, to make an independent inquiry into the matter. This gentleman now reports that there is no connection whatever between the disease of the cow and scarlet fever: But he has made the curious discovery, that the eruptive disease of the udder of the animal which was thus suspected is in reality true cowpox, an ailment common enough in this country in the time of Jenner, but which has since entirely disappeared. The recurrence of this disease is not only interesting, but important, as furnishing once more a source of true vaccine lymph.

The old plan of using an endless railway to embrace the wheels of vehicles which have to traverse soft soil or swampy situations, has lately been revived by Mr William Fender of Buenos Ayres. The method, as before tried, did not prove satisfactory; but Mr Fender has made several improvements in the system, by which difficulties have been made to disappear. The railway consists of a chain of flat slabs of hardwood, which are riveted between thin steel plates, and are linked together. The chain embraces the wheels, so that, as they turn, the blocks form themselves into a railway in front of them. The system has been used with great success in carting beetroot over swampy grounds in the neighbourhood of Berlin; and it is thought that it may be profitably employed in ordinary ploughing operations with a single engine, superseding the double system which is now common in this country.

The recent discovery of gold in North Wales has excited a great deal of attention. It seems that Mr Morgan, who owns land in the Mawddach Valley, Dolgelly, was long ago impressed with the opinion that gold existed at this spot in large quantities; but he was determined that he would publish no report of the circumstance until he could actually produce ingots of the precious metal. But rumours of the works which he caused to be carried out quickly got abroad, and as contradictory statements were promulgated, he has taken the wise course of publishing the real facts. We now learn that Mr Morgan has had about one hundred men at work for several months, and that by their aid many thousands of tons of stone richly laden with gold are ready for treatment. A great part of this earth is estimated to yield six ounces of gold to the ton, and it is believed that the mine now in operation is one of the richest in the world. Mr Morgan believes that there are fifty other sites in Wales alone where gold will be found in paying quantities. It is worth while to remember that gold has been found in former times in Wales, in England, and in Scotland; but the works

have been abandoned because the metal could not be recovered in paying quantities. But now that improved methods of amalgamation have been discovered, it may be worth the while of speculators to reopen some of these abandoned works.

A curious method of preventing railway collisions has been invented by an Austrian engineer. The apparatus consists of a pilot-vehicle worked by electricity, and running at some distance in front of the train, its movements being under the control of the engine-driver. The advanced lorry is fitted with glass vessels containing mercury contacts, so that if these should be broken by collision with anything on the line, the interruption of the current thus caused is made to act on the vacuum brake, and so bring the train behind to a standstill. The plan seems to be an ingenious one, but rather too complicated for adoption on our busy lines of railway.

M. Pasteur has made a curious suggestion with regard to eradicating the rabbit plague in Australia, a suggestion which has been prompted by the offer of a handsome reward by the government to the discoverer of some means of stamping out the pest. His remedy seems on the face of it to be rather a cruel one, but perhaps not more cruel really than many other methods which have been suggested. He believes that an attempt should be made to introduce a disease among rabbits, which would, he thinks, quickly exterminate them. There is a malady known as hen-cholera, and poultry-yards have sometimes been devastated by an epidemic of this kind. He believes that the same fate would befall the rabbits if the disease could be carried into their burrows. He suggests that a movable fence should be placed round a certain space frequented by the animals, and food tainted with germs of hen-cholera should be put within the enclosure. By this means the poor rabbits would catch the disease and infect all their neighbours. The disease in question is innocuous to domestic quadrupeds, and we suppose the fowls must take their chance.

Mr C. F. Henwood recently read an interesting paper at the Royal United Service Institution on the Fouling of Ships. As a method of prevention of this fouling, which, as we all know, causes so much loss of speed and expense in dry docking for removal of deposits, he advocates the use of a zinc sheathing for steel and iron ships. The combined metals, by setting up a galvanic action, would prevent the barnacles and other marine creatures attaching themselves to the submerged part of the ship, for the zinc would be constantly dissolving away in the form of oxide, leaving a fresh and clean surface.

A large building of novel construction has recently been erected in Lincoln's Inn Fields. It has a frontage of forty feet, and consists of eight floors, an unusual height for a London building, which at once attracts attention. But its novel feature is in its general construction. Its foundation consists of a solid block of concrete three feet in thickness, which may be supposed to shut out all dangers from imperfect drainage, and upon this solid foundation the building has been reared in moulded concrete. The walls of the floors are of the same construction, being tied together by iron bars embedded in the material, so that they represent no source of danger in case of fire. But in reality the building is fireproof, and it is

intended that no insurance shall be effected on it, as being quite unnecessary. The only woodwork used in the building is for the doors, window-frames, the lift, and the handrail of the staircase. The building is faced with Doulton stone, and it has a number of strong-rooms fitted with iron doors. The cost of this method of construction is said to be not much in excess of that ordinarily employed.

So many reputed methods of curing consumption have at different times been published, raising false hopes in the minds of the victims of that distressing malady, that we feel some hesitation in giving publication to another. But, according to an American scientific paper, the method of M. Garcin has been proved to be of real benefit to sufferers. Observations had previously been made at certain glassworks that the use of hydrofluoric acid—which we may remind our readers is used for etching glass—had a very favourable effect upon those workmen who were suffering from pulmonary tuberculosis. From this circumstance M. Garcin was induced to try the experiment of submitting his patients to an atmosphere containing this acid. His method is to enclose the sufferers for an hour every day in a small chamber charged with air mixed with the vapour from the acid, the strength of the charge being regulated according to whether they are but slightly attacked, or whether they are seriously affected with the disease. The effect of this treatment is said to be most satisfactory, the attacks of coughing diminishing in frequency, the appetite improving, and the terrible night-sweats disappearing altogether. It is to be hoped that further experiments will demonstrate the value of this new remedy.

Great interest has been aroused lately by the report that a periodic star called the 'Star of Bethlehem' has been visible in the heavens; and the star is said to have a period of three hundred and fifteen years. This report rests upon the most shadowy foundation. It is true that some three hundred years back such a star was asserted to have appeared in Cassiopeia with the period named, but the observation has not been endorsed by any modern astronomer. But at this time the name 'Star of Bethlehem' has been curiously assigned to Venus, which planet, during the past December, has been placed so favourably for observation, that in the early morning sky it has formed a very beautiful object. The mistake has been widespread, and it is impossible to trace its origin.

We have often in these columns advocated the use of oil at sea as a means of calming the waves; and of late years, as our readers know, a great many experiments on different parts of our coasts have proved the value of the method. We are interested to see that a patent wave-subduer has been constructed and placed upon the market, by which the process of administering oil to the water is greatly simplified. Larsen's Wave-Subduer consists of a very strong canvas bag of conical form, furnished at the top with a cover of galvanised iron, and provided with a brass cap through which the oil can be introduced. At its lower end is a special form of valve, which allows the oil to trickle through gradually, its slow exit being further provided for by partly filling

the canvas bag with oakum. The apparatus is strongly made, and is very cheap; and from letters which we have seen testifying as to the benefits which accrue from its use, it is evident that it is a piece of apparatus which every ship should carry. Further particulars can be obtained from Mr Gerson Trier, 35 Eastcheap, London, E.C.

We may also mention that the Board of Trade have recently issued a circular memorandum on the use of oil at sea for modifying the effect of breaking waves. This circular mentions the various successful experiments which have been made, and gives detailed directions as to the best method of applying the oil under varied circumstances. The heaviest and thickest oils are recommended as being the most effectual; but their action is much retarded in cold weather, when of course they congeal to some extent. Refined kerosene is all but useless for the purpose; crude petroleum should only be used when nothing else is available; 'but all animal and vegetable oils, such as waste oil from the engines, have great effect.'

An interesting calculation has been lately made by Professor Rogers of Washington. He tells us that the dynamic power of a single pound of good steam-coal is equivalent to the work of a man for one day; three tons of the same coal will represent a man's labour for twenty years; and one square mile of a seam of coal having a depth of four feet only will represent as much work as a million men can perform in twenty years. Such calculations as these may serve to remind us how very wasteful our methods of burning fuel must be, in spite of all that has been done by engineers in the way of economy.

KITCHEN BOILERS AND FROST.

THE return of winter and its attendant discomforts forms an apology for dwelling briefly on that source of anxiety in many households when frost sets in—the water-supply, and the possible risk of accident from derangement of the domestic hot-water system. The careful housekeeper, though cheered by the advent of seasonable weather, with clean roads and clear, crisp atmosphere, yet regards the kitchen boiler with anxiety, and not without reason, for, as a writer on this subject has pointed out, in ten days of a recent January, 'no fewer than forty explosions of household boilers were recorded in the public papers, killing twelve persons, and seriously injuring more than a score of others.' In some instances, explosion is so dreaded, that, we believe, the kitchen fire is put out until the frost is over, an inconvenience and discomfort needing no comment. When, however, we consider the disastrous effects of explosion on the one hand, and the exceedingly simple means by which safety can be insured, it seems marvellous that persons should run, year by year, the risks they do, when, at trifling cost, immunity from danger can be secured.

There is no mystery about these boiler explosions; they simply occur from over-pressure of steam, arising from the outlets becoming choked and the steam having no escape. Cases do occur of such stoppages arising from rust and the 'furring' of the pipes; but most frequently from the pipes becoming frozen.

The immediate cause of disaster is that, during the night, the pipes leading into the boiler become frozen; and on the fire being relighted in the morning, steam is generated, which, being unable to escape, increases in pressure until explosion results. It cannot be too emphatically pointed out, or too repeatedly insisted on, that the remedy for all such disaster is to provide every boiler with a reliable safety-valve, which shall relieve the pressure of steam before the ultimate strength of the boiler is approached. No locomotive, marine, or other class of engineering boiler is constructed without one, if not two thoroughly efficient safety-valves. It is difficult to understand why a similar custom should not hold in the manufacture of household boilers.

Into the question of the particular make of safety-valve most suitable for the purpose now under discussion, we do not propose to enter; many excellent patterns now hold the market, leaving nothing to be desired both as regards efficiency and cost, the outlay for which, including fixing, &c., is about one pound—a small sum compared with the discomfort, to say nothing of possible injury to life, limb, and property, arising from explosion.

The main points in a safety-valve are, that it should be simple in construction, with as few wasting parts as possible; should not easily get out of order; should act readily at all times; and should be so placed that it can be inspected without difficulty from time to time.

'MY HOUSE IS LEFT UNTO ME DESOLATE.'

A LITTLE while, you tell me, but a little while,
And I shall be where my beloved are;
And with your eyes all large with faith, you say,
'Thy dear ones have not journeyed very far.'

'Not very far.' I say it o'er and o'er,
Till on mine ear mine own voice strangely falls,
Like some mechanic utterance that repeats
A meaningless refrain to empty walls.

'Not very far;' but measured by my grief,
A distance measureless as my despair,
When, from the dreams that give them back to me,
I wake to find that they have journeyed there!

'Not very far.' Ah me! the spirit has
Had its conjectures since the first man slept;
But, O the heart, it knoweth its own loss,
And death is death, as 'twas when Rachel wept!

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

PRICE 1½d.

EARLY BLOSSOMS.

THE 'firstling of the infant year' is undoubtedly the snowdrop. There is, or used to be, a popular belief that it ought to be in bloom by the 2d of February; but, in an ordinary year, this can seldom be the case, and then only under exceptional circumstances of culture or of situation. The idea itself is traceable to the times before the Reformation. The inhabitants of the conventual establishments of those days had, among the employments of their leisure hours, amused themselves in constructing a sort of floral calendar. According to this, some special flower was considered appropriate, and assigned to each day in the year; while many were looked upon as sacred to certain personages. The snowdrop was dedicated to the Virgin Mary, and the day which was ascribed to it in the calendar was the Feast of Candlemas or Purification—otherwise, the 2d of February. It was consequently much cultivated in the gardens attached to convents and monasteries, whence, in the natural order of things, it would pass to those of the rich, and thence to those of the peasants and cottagers. It is in this way that the snowdrop has established itself in one or two places in England and Scotland, and given rise to the impression that it is really indigenous to the British Isles. This would seem, however, not to be the case. The places where it is found are nearly always in the neighbourhood of villages or country-houses; while, in a great many cases, the former vicinity of an abbey or other religious institution is either a fact well known or probable. It is doubtful if the snowdrop was ever really wild here, although there is no record, as in the case of many flowers, of when it was imported, or from what country the roots were first brought to England.

There would seem to be only two parts of Europe where the snowdrop is truly indigenous—Switzerland and the Rhine provinces. The statement in some French botanical works that it is found in France, must be received with caution. The localities assigned to it are those which appear to

be the most unlikely—namely, the west and the south. The flora, however, of Southern France is so entirely unlike that of our more northern latitudes, and so thoroughly characteristic of a warmer region, that it seems improbable that a plant like the snowdrop could find a place in it. The explanation here is probably the same as in the case of England: the plant has strayed from cultivation, and, possibly, in one or two localities, become perfectly naturalised. There is only one other snowdrop known to botanists besides our garden friend, and that is a kind which is found in the Asiatic provinces of Russia and Turkey. It does not greatly differ in shape or size from its European cousin, but having six outer leaves where our species has only three, it could not well be the progenitor of those known to us. The original habitat, then, of our snowdrop must be sought for in Europe, and it is very probable that Switzerland was the land of its birth. Professor Dalla Torre's *Flora of the Alps* gives it as 'locally abundant' on some of the meadows and slopes of that mighty chain; and in those spots it is very evident that it could be no waif from cultivation.

It must not, however, be supposed that the snowdrop is an Alpine plant, in the strict sense of the term. The impression that it is the hardiest of flowers, and, on the first approach of spring, rears its tiny head from under the snow and close up to the snow-line, is erroneous. Although it is never found in a wild state in flat or damp situations, it is far from being a native of very high regions. Dalla Torre certainly gives it a range up to four thousand or more feet; but it would seem to be very doubtful whether it ever actually occurs at such an elevation. It would perhaps be more correct to describe it as essentially a *sub-Alpine* plant, and in no way capable of supporting a very extreme degree of cold, or of flourishing under conditions greatly different from those it meets with in our gardens. The localities where it is most at home are woods or coppices which have a gentle slope to the south or west. It likes a certain amount of shade, but not too

cold a shade—just sufficient to afford shelter from the cutting winds of spring—and must have as much warmth as can be derived from the direct rays of the sun during some hours of the day, as well as from a protected position. If left to itself under these conditions, it will not only increase and multiply at a rapid rate, but the flowers will also be larger and more fragrant than any which can be produced by the most careful cultivation in a garden.

The snowdrop being essentially a northern flower, was unknown to the ancients. Linæus, consequently, when he came to arrange his 'Systema,' found no classical name ready to his hand, but had to invent one for himself. He took the two Greek words signifying 'milk' and 'flower,' and out of them made the compound *galanthus*, while to this he added the Latin epithet *nivalis*, 'snowy,' or 'belonging to the snow.' As a plant, then, of entirely modern lineage, and, so to say, a parvenu among flowers, it was impossible for the snowdrop to have attached to it any of those poetical legends with which the Greeks were accustomed to associate some of the best known flowers. There is, it is true, a legend connected with it, but it evidently belongs to the middle ages, and is, apparently, of monastic origin. It states that 'one day after the Fall, Eve stood in paradise lamenting the barrenness of the earth, which no longer produced vegetation, and where no flowers grew. An angel, pitying her sad condition, exposed as she was to the blinding snow which was falling at the time, came down to the earth to try to console her. He listened to her complaints; and being moved with pity for so much grief, took in his hand a flake of the snow, and, breathing upon it, bade it take the form of a flower and bud and blow. He at the same time added that the little blossom should be a sign and a symbol to her that the winter was over, and that the sun and the summer would soon return. Eve prized her new treasure greatly, and praised it more than all the flowers which formerly bloomed in paradise. On raising her eyes to express her gratitude to the angel, he was nowhere to be seen; but on the place where he had stood was a snow-white ring, which she had no difficulty in recognising as composed of snowdrops.' This legend sufficiently betrays its northern origin. Independently of the snowdrop being unknown in southern or oriental countries, the idea of snow falling in those localities where the garden of Eden was commonly supposed to have been placed, is evidence enough that the story was composed by some dweller in higher latitudes.

But if the snowdrop is not gifted with an ancient pedigree, its immediate successor, the crocus, can, on the contrary, trace its descent to the very dawn of history itself. The Greeks, and after them the Romans, had an intense liking for the taste and scent of saffron, and consequently for the flower which produced it. Classical literature is full of affectionate allusions to the crocus. Homer makes the couch of Juno 'soft and close with dewy lotus, crocus, and hyacinth,' a passage which is imitated by Milton in the fourth book of *Paradise Lost*. Sophocles says that on the hill of Colonus 'there burst into bloom, by the dew of heaven, the narcissus with its beauteous clusters, and the crocus with its golden ray.' Horace

tells us that the stages of theatres were strewed with crocuses and other flowers; while Juvenal hopes that round the tombs of those guardians who have done their duty to their wards there may ever bloom 'the fragrant crocus and a perpetual spring.'

None of our yellow crocuses are of European origin; they come to us from the East, and appear to be comparatively recent importations. 'Cloth-of-Gold,' for instance, is a native of Turkey and the Crimea, while the original home of the large yellow crocus is Asia Minor. Many other kinds have no doubt been produced by the ingenuity of the Dutch gardeners, always skilful in their treatment of bulbs. The chief interest of the crocus lies, however, in the fact of its connection with the saffron of commerce. Twice in the course of history this latter drug has enjoyed a popularity which seems strange to us—once under the Greeks and Romans, and again in Europe during the fifteenth and sixteenth centuries. Saffron itself is nothing more than the dried stigmas of a certain purple crocus which blossoms in the autumn. It seems originally to have been brought from the East. Its name in any case is Eastern, being, it is said, merely a change of the Arabic word *zahfarân*. The Greeks and the Romans, it is true, knew nothing of this name, but always used the term crocus for saffron. The undoubted fact, however, of its having, on its reappearance in Europe, been imported from the East, confirms the tradition or notion of its oriental origin. It was, strangely enough, the scent which formed its chief attraction for the ancients. They regarded it as the most delicious of perfumes, and endeavoured to introduce it on every possible occasion. The floors of their halls and mansions, as also of their theatres, were strewed with it; and Pliny in one place recommends that the saffron should be bruised, in order the better to diffuse its fragrance. Its flavour was also greatly appreciated; and Beckmann says that 'in the oldest work on Cookery which has been handed down to us, and which is ascribed to Apicius, it appears that saffron was as much employed in seasoning dishes as for a perfume.'

With the overthrow, however, of the Roman empire, the taste for saffron, and even the plant itself, became lost. As to the precise period of its re-introduction into Europe, there is some little obscurity. Beckmann is of opinion that it was brought by the Moors into Spain, founding his conjecture on the Arabic derivation of the name. Earlier writers, however, all agree that it was brought back by the crusaders from the East. The first mention of it is, probably, in Hakluyt's *Voyages*, 1589. He says that 'a pilgrim, proposing to do good to his country, stole a head of saffron, and hid the same in his palmer's staff, which he had made hollow before on purpose, and so he brought this root into the realm with venture of his life; for, if he had been taken, by the law of the country whence it came, he had died for the fact.' Unfortunately, we have the same story, or legend, with regard to the introduction of silkworms' eggs, and the probability in each case is that the account is untrue. At all events, by the beginning of the fifteenth century we find it firmly established both in France and England. It was so largely cultivated at Walden,

in Essex, that the place came to be called, and has ever since been known as Saffron-Walden. Saffron Hill, in London, also owes its name to the fact of large quantities of the plant having been grown on the ground which formerly belonged to Ely House. It was popular as a perfume, and as a seasoning for various dishes; also as a dye. Above all, it was popular for medicinal purposes. The physicians of the time seem to have looked upon it as a veritable *elixir vite*. They ascribed to it every possible virtue under the sun, and applied to it such grand names as *Panacea vegetabilis* and *Aurum philosophorum*. Christopher Cattan (*Geomancie*, 1591) says that 'saffron hath power to quicken the spirits, and the virtue thereof pierceth by-and-by to the heart, provoking laughter and merriness; and they say that these properties come by the influence of the sun, unto whom it is subject, from whence she is ayded by his subtil nature, bright and sweet smelling.' As an accompaniment to cookery, it was much used during Lent, its medicinal properties being supposed to counteract the effects of the spare diet of the season.

By the sixteenth century, saffron had become a highly important article of commerce, while its high price rendered it a favourite article of adulteration. An edict of Henry II. of France, issued in the year 1550, says that 'for some time past a certain quantity of the said saffron has been found altered, disguised, and sophisticated by being mixed with oil, honey, and other mixtures, in order that the said saffron, which is sold by weight, may be rendered heavier; and some add to it other herbs, similar in colour and substance to beef over-boiled and reduced to threads; which saffron, thus mixed and adulterated, cannot be long kept, and is highly prejudicial to the human body; which, besides the said injury, may prevent the above said foreign merchants from purchasing it, to the great diminution of our revenues, and to the great detriment of foreign nations, against which we ought to provide.' It would appear, however, from an account of the adulteration of saffron written in the beginning of the present century, that what was described in the royal edict as herbs 'similar to beef over-boiled,' was in reality the article itself. The list of ingredients employed includes 'fibres of smoked beef;' but by what process these could be rendered similar to the bright yellow stigmas of the saffron crocus is not very clear. The other substances used for the purpose were mostly of vegetable origin, and include the stigmas of nearly all plants which were naturally of a similar colour. Besides these, the chopped flowers of the pomegranate and the petals of the marigold were also brought into requisition. To obtain, however, a really good imitation of saffron, reliance was chiefly placed on the yellow blossoms of the safflower (*Carthamus*), a native of Egypt, which, when dried, although of a deeper colour, were supposed to be near enough for all practical purposes. The safflower itself is still valuable as furnishing a brilliant red dye, and it is to this that that once fashionable article, ladies' rouge, owes, or ought to owe, its fascinating bloom.

The taste for saffron has only entirely died out within the limits of the present century. It is scarcely more than a generation ago that its pun-

gent and peculiar flavour could still be detected in certain articles of confectionery. Up to a very short time since, a few acres were cultivated, and still may be, in Cambridgeshire and Essex. The bulbs were planted about midsummer, in a rich light soil, and in rows some six inches apart. The flowers were gathered in the morning as soon as they were quite open, and the stigmas carefully picked out by hand. They were then placed between sheets of paper and dried in a kiln. The saffron was at one time pressed into small cakes and sent into the market in that form. This was, however, so persistently imitated by those engaged in adulteration, that cake-saffron, as it was called, got a bad name, and of late years the stigmas have always been sold loose. The French and Spanish saffron, however, was supposed to be better than that grown in England, and whatever comes into the market now is said to be imported from those countries.

THIS MORTAL COIL.

BY GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER VII.—FRIENDS IN COUNCIL.

THAT same night, as the Squire and Mrs Meysey sat by themselves towards the small-hours—after the girls had unanimously evacuated the drawing-room—discussing the affairs of the universe generally, as then and there envisaged, over a glass of claret-cup, the mother looked up at last with a sudden glance into the father's face and said, in a tone half-anxious, half-timid: 'Tom, did it happen to strike you this afternoon that that handsome cousin of Elsie Challoner's seemed to take a great fancy to our Winifred?'

The Squire stirred his claret-cup idly with his spoon. 'I suppose the fellow has eyes in his head,' he answered bluntly. 'No man in his senses could ever look at our little Winnie, I should think, Emily, and not fall over his ears in love with her.'

Mrs Meysey waited a minute or two more in silent suspense before she spoke again; then she said once more, very tentatively: 'He seems a tolerably nice young man, I think, Tom.'

'Oh, he's well enough, I daresay,' the Squire admitted grudgingly.

'A barrister, he says. That's a very good profession,' Mrs Meysey went on, still feeling her way by gradual stages.

'Never heard so in my life before,' the Squire grunted out. 'There are barristers and barristers. He gets no briefs. Lives on literature, by what he tells me: next door to living upon your wits, I call it.'

'But I mean, it's a gentleman's profession, anyhow, Tom, the bar.'

'Oh, the man's a gentleman, of course, if it comes to that—a perfect gentleman; and an Oxford man, and a person of culture, and all that sort of thing—I don't deny it. He's a very presentable fellow, too, in his own way; and most intelligent: understands the riparian proprietors' question as easy as anything.—You can ask him to dinner whenever you choose, if that's what you're driving at.'

Mrs Meysey called another halt for a few seconds before she reopened fire, still more timidly than ever. 'Tom, do you know I rather fancy

he really likes our Winifred?' she murmured, gasping.

'Of course he likes our Winifred,' the Squire repeated, with profound conviction in every tone of his voice. 'I should like to know who on earth there is that doesn't like our Winifred! Nothing new in that. I could have told you so myself. Go ahead with it, then.—What next, now, Emily?'

'Well, I think, Tom, if I'm not mistaken, Winifred seemed rather inclined to take a fancy to him too, somehow.'

Thomas Wyville Meysey laid down his glass incredulously on the small side-table. He didn't explode, but he hung fire for a moment. 'You women are always fancying things,' he said at last, with a slight frown. 'You think you're so precious quick, you do, at reading other people's faces. I don't deny you often succeed in reading them right. You read mine precious often, I know, when I don't want you to—that I can swear to. But sometimes, Emily, you know you read what isn't in them. That's the way with all decipherers of hieroglyphics. They see a great deal more in things than ever was put there. You remember that time when I met old Hillier down by the copse yonder?—'

'Yes, yes, I remember,' Mrs Meysey admitted, checking him at the outset with an astute concession. She had cause to remember the facts, indeed, for the Squire reminded her of that one obvious and palpable mistake about the young fox-cubs at least three times a week, the year round, on an average. 'I was wrong that time; I know I was, of course. You weren't in the least annoyed with Mr Hillier. But I think—I don't say I'm sure, observe, dear—but I think Winifred's likely to take a fancy in time to this young Mr Massinger. Now, the question is, if she does take a fancy to him—a serious fancy—and he to her—what are you and I to do about it?'

As she spoke, Mrs Meysey looked hard at the lamp, and then at her husband, wondering with what sort of grace he would receive this very revolutionary and upsetting suggestion. For herself—though mothers are hard to please—it may as well be admitted off-hand, she had fallen a ready victim at once to Hugh Massinger's charms and brilliancy and blandishments. Such a nice young man, so handsome and gentlemanly, so adroit in his talk, so admirable in his principles, and though far from rich, yet, in his way, distinguished! A better young man, darling Winifred was hardly likely to meet with. But what would dear Tom think about him? she wondered. Dear Tom had such very expansive not to say utopian ideas for Winifred—thought nobody but a Duke or a Prince of the blood half good enough for her: though, to be sure, experience would seem to suggest that Dukes and Princes, after all, are only human, and not originally very much better than other people. Whatever superior moral excellence we usually detect in the finished product may no doubt be safely set down in ultimate analysis to the exceptional pains bestowed by society upon their ethical education.

The Squire looked into his claret-cup profoundly for a few seconds before answering, as if he expected to find it a perfect Dr Dee's divining crystal, big with hints as to his daughter's future;

and then he burst out abruptly with a grunt: 'I suppose we must leave the answering of that question entirely to Winnie.'

Mrs Meysey did not dare to let her internal sigh of relief escape her throat; that would have been too compromising, and would have alarmed dear Tom. So she stifled it quietly. Then dear Tom was not wholly averse, after all, to this young Mr Massinger. *He*, too, had fallen a victim to the poet's wiles. That was well; for Mrs Meysey, with a mother's eye, had read Winifred's heart through and through. But we must not seem to give in too soon. A show of resistance runs in the grain with women. 'He's got no money,' she murmured suggestively.

The Squire flared up. 'Money!' he cried, with infinite contempt, 'money! money! Who the dickens says anything to me about money? I believe that's all on earth you women think about.—Money indeed! Much I care about money, Emily. I daresay the young fellow hasn't got money. What then? Who cares for that? He's got money's worth. He's got brains; he's got principles; he's got the will to work and to get on. He'll be a Judge in time, I don't doubt. If a man like that were to marry our Winifred, with the aid we could give him and the friends we could find him, he ought to rise by quick stages to be—anything you like—Lord Chancellor, or Postmaster-general, or Archbishop of Canterbury, for the matter of that, if your tastes happen to run in that direction.'

'He hasn't done much at the bar yet,' Mrs Meysey continued, playing her fish dexterously before landing it.

'Hasn't done much! Of course he hasn't done much! How the dickens could he? Can a man make briefs for himself, do you suppose? He's given himself up, he tells me, to earning a livelihood by writing for the papers. Penny-a-lining; writing for the papers. He had to do it. It's a pity, upon my word, a clever young fellow like that—he understands the riparian proprietors' question down to the very ground—should be compelled to turn aside from his proper work at the bar to serve tables, so to speak—to gain his daily bread by penny-a-lining. If Winifred were to take a fancy to a young man like that, now'—The Squire paused, and eyed the light through his glass reflectively.

'He's very presentable,' Mrs Meysey went on, re-arranging her workbox, and still angling cleverly for dear Tom's indignation.

'He's a man any woman might be perfectly proud of,' the Squire retorted in a thunderous voice with firm conviction.

Mrs Meysey followed up her advantage persistently for twenty minutes, insinuating every possible hint against Hugh, and leading the Squire deeper and deeper into a hopeless slough of unqualified commendation. At the end of that time she said quietly: 'Then I understand, Tom, that if Winifred and this young Massinger take a fancy to one another, you don't put an absolute veto on the idea of their getting engaged, do you?'

'I only want Winnie to choose for herself,' the Squire answered with prompt decision. 'Not that I suppose for a moment there's anything in this young fellow's talking a bit to her. Men *will* flirt, and girls *will* let 'em. Getting engaged

indeed! You count your chickens before the eggs are laid. A man can't look at a girl nowadays, but you women must take it into your precious heads at once he wants to go straight off to church and marry her. However, for my part, I'm not going to interfere in the matter one way or the other. I'd rather she'd marry the man she loves, and the man who loves her, whenever he turns up, than marry fifty thousand pounds and the best estate in all Suffolk.'

Mrs Meysey had carried her point with honours. 'Perhaps you're right, dear,' she said diplomatically, as who should yield to superior wisdom. It was her policy not to appear too eager.

'Perhaps I'm right!' the Squire echoed, half in complacency and half in anger. 'Of course I'm right. I know I'm right, Emily. Why, I was reading in a book the other day a most splendid appeal from some philosophic writer or other about making fewer marriages in future to please Mamma, and more to suit the tastes of the parties concerned, and subserve the good of coming generations. I think it was an article in one of the magazines. It's the right way, I'm sure of that; and in Winifred's case I mean to stick to it.'

So, from that day forth, if it was Hugh Massinger's intention or desire to prosecute his projected military operations against Winifred Meysey's hand and heart, he found at least a benevolent neutral in the old Squire, and a secret, silent, but none the less powerful domestic ally in Mrs Meysey. It is not often that a penniless suitor thus enlists the sympathies of the parental authorities, who ought by precedent to form the central portion of the defensive forces, on his own side in such an aggressive enterprise. But with Hugh Massinger, nobody ever even noticed it as a singular exception. He was so clever, so handsome, so full of promise, so courteous and courtly in his demeanour to young and old, so rich in future hopes and ambitions, that not the Squire alone, but everybody else who came in contact with his easy smile, accepted him beforehand as almost already a Lord Chancellor, or a Poet Laureate, or an Archbishop of Canterbury, according as he might choose to direct his talents into this channel or that; and failed to be surprised that the Meyseys or anybody else on earth should accept him with effusion as a favoured postulant for the hand of their only daughter and heiress. There are a few such universal favourites here and there in the world: whenever you meet one, smile with the rest, but remember that his recipe is a simple one—Humbug.

Hugh stopped for two months or more at Whitestrand, and during all that time he saw much both of Elsie and of Winifred. The Meyseys introduced him with cordial pleasure to all the melancholy gaieties of the sleepy little peninsula. He duly attended with them the somnolent garden-parties on the smooth lawns of neighbouring Squires: the monotonous picnics up the tidal stream of the meandering Char; the heavy dinners at every local rector's and vicar's and resident baronet's; with all the other dead-alive entertainments of the dulllest and most stick-in-the-mud corner of all England. The London poet enlivened them all, however, with his never-failing flow of languid humour, and his slow,

drawled-out readiness of Pall-Mall repartee. It was a comfort to him, indeed, to get among these unspoiled and unsophisticated children of nature; he could palm off upon them as original the last good thing of that fellow Hatherley's from the smoking-room of the Cheyne Row Club, or fire back upon them, undetected, dim reminiscences of pungent chaff overheard in brilliant West-end drawing-rooms. And then, there were Elsie and Winifred to amuse him; and Hugh, luxurious, easy-going epicurean philosopher that he was, took no trouble to decide in his own mind even what might be his ultimate intentions towards either fair lady, satisfied only, as he phrased it to his inner self, to take the goods the gods provided him for the passing moment, and to keep them both well in hand together. 'How happy could I be with either,' sings Captain Macheath in the oft-quoted couplet, 'were t'other dear charmer away.' Hugh took a still more lenient view of his personal responsibilities than the happy-go-lucky knight of the highway: he was quite content to be blest, while he could, with both at once, asking no questions, for conscience' sake, of his own final disposition, marital or otherwise, towards one or the other, but leaving the problem of his matrimonial arrangements for fate, or chance, to settle in its own good fashion.

It was just a week after his arrival at Whitestrand that he went up one morning early to the Hall. Elsie and Winifred were seated together on a rug under the big tree, engaged in reading one novel between them.

'You must wish Winifred many happy returns of the day,' Elsie called out gaily, looking up from her book as Hugh approached them. 'It's her birthday, Hugh; and just see what a lovely, delightful present Mr Meysey's given her!'

Winifred held out the present at arm's length for his admiration. It was a pretty little watch, in gold and enamel, with her initials engraved on the back on a broad shield. 'It's just a beauty! I should love one like it myself!' Elsie cried enthusiastically. 'Did you ever see such a dear little thing? It's keyless too, and so exquisitely finished. It really makes me feel quite ashamed of my own poor old battered silver one.'

Hugh took the watch and examined it carefully. He noted the maker's name upon the dial, and opening the back, made a rapid mental memorandum of the number. A sudden thought had flashed across him at the moment. He waited only a few minutes at the Hall, and then asked the two girls if they could walk down into the village with him. He had a telegram to send off, he said, which he had only just that moment remembered. Would they mind stepping over with him as far as the post-office?

They strolled together into the sleepy High Street. At the office, Hugh wrote and sent off his telegram. It was addressed to a well-known firm of watchmakers in Ludgate Hill. 'Could you send me by to-morrow evening's post, to address as below, a lady's gold and enamel watch, with initials "E. C., from H. M." engraved on shield on back, but in every other respect precisely similar to No. 2479 just supplied to Mr Meysey, of Whitestrand Hall? If so, telegraph back cash-price at once, and cheque for

amount shall be sent immediately. Reply paid.—Hugh Massinger, *Fisherman's Rest*, Whitestrand, Suffolk.'

Before lunch-time, the reply had duly arrived: 'Watch shall be sent on receipt of cheque. Price twenty-five guineas.' So far, good. It was a fair amount for a journeyman journalist to pay for a present; but, as Hugh shrewdly reflected, it would kill two birds with one stone. Day after to-morrow was Elsie's birthday. The watch would give Elsie pleasure; and Hugh, to do him justice, thoroughly loved giving pleasure to anybody, especially a pretty girl, and above all Elsie. But it could also do him no harm in the Meyseys' eyes to see that, journeyman journalist as he was, he was earning enough to afford to throw away twenty-five guineas on a mere present to a governess-cousin. There is a time for economy, and there is a time for lavishness. The present moment clearly came under the latter category.

THE PEOPLES OF FUR-LAND.

It used to be an article of faith among ethnologists that Alaska had been peopled from Japan, this belief being founded upon the reports of old Russian travellers, who fancied they saw some physical resemblance between the Aleuts and the Japanese. But the Aleuts only inhabit one of the divisions of Alaska, and that the smallest, and there are several other races inhabiting this enormous and little explored territory, whose distinctive features and racial characteristics form an interesting subject of examination. From what is now known, the natives of Alaska can be broadly classified in four great divisions—namely, the Eskimo or Innuít, the Aleut or Oonágan, the Athabaskan or Tinneh, and the Thlinket tribes.

The Eskimos are called Innuits by some writers because the name is derived from a native word signifying 'man,' and is supposed to be their own designation of themselves. In Alaska the Eskimos number altogether about eighteen thousand, inhabiting most of the coast-line, as well as the interior portions of the Arctic division. Where they came from is of course pure matter of conjecture, but one theory is, that they originated in the centre of the American continent, and that their settlement on the Alaskan coasts was coincident with the general migration which led a portion of the same race to Greenland. The theory of a common origin finds some support in the fact that the *kaiak* or skin-canoe of the Alaskans is identical in construction with that of the Greenlanders. This *kaiak*, which is a covered boat, is found only among pure Eskimos, and is lost wherever there has been intermixture with other races. This is a curious fact, as it forms a distinct mark of identity.

There are several subdivisions or tribes of the Eskimos, some of them possessing marked distinctive traits; but certain features and habits they possess in common. They live in winter in underground, sod-covered houses, and in skin-

covered tents in summer. They use implements of stone, of ivory, and of bone; they live upon fish, including seal and walrus and raw blubber; and they clothe themselves generally in skins, although in parts where there is constant intercourse with the traders and whalers, they have sometimes adopted cloth garments for summer wear. And yet one can scarcely call their subdivisions 'tribes,' seeing that there is no evidence of an essential feature of tribal existence—chieftainship. A headman there is in each village, called the oomalik; but his function seems more that of a commission agent in negotiating with other tribes and foreigners, than that of governor. In fact, he appears to possess no real influence over the people, and far less attention is paid to him than to the 'medicine-man' or shaman. These shamans—otherwise sorcerers—are the masters-of-ceremonies at all the village festivals, which are frequent during the long dark winters, as well as the representatives of all the supernatural or religious belief which the Eskimos possess. When joint action is necessary, the plans are arranged by a council of the elders, and by such decisions all the inhabitants of a village are held bound.

The coast tribes are noted for more intelligence and shrewdness, which is probably more the result of longer and larger intercourse with white races than of natural superiority. They are also superior physically, the Kaialigumute of Norton Sound, for instance, being well built, of medium stature, round-faced, white-teethed, with bronze complexions, and of quick movements. The hair is straight, glossy, and black, but coarse, and the men usually have both beards and moustaches. Polygamy is not common, although not unknown; and, on the other hand, separations of married couples are rare; and although a man may marry again if his wife dies, the line is drawn at the third. The marriage ceremony of the Eskimos is extremely simple. After obtaining the consent of the parents, the bridegroom just goes and takes his bride away to his own people, and the knot is tied. The families are not large, a woman's offspring rarely exceeding two—a family of four being quite phenomenal. Marriages take place at a very early age, and at twenty-five a wife is an old woman.

A pleasing feature in the Eskimos is their kindness to their children. These are treated with the greatest indulgence, and allowed to do and to have pretty much what they please until of an age to support themselves. But they are taught the use of the arms and the tools possessed by their tribe, and miniature implements are constructed for their education. The standard of manhood is neither twenty-one years nor the passing of 'exams,' but the killing of a wolf, a reindeer, or a beluga-whale. After such an enterprise, a youth becomes a man. Meanwhile, the various stages of his adolescence are marked by curious ceremonies; that is to say, feasts are held when his hair is trimmed for the first time (the men wear the hair trimmed all round the head, while the women wear it loose or plaited); when he first goes to sea alone in a *kaiak*; when he makes his first expedition in snow-shoes; or when his lip is cut to receive the *labrets* or ornaments of

stone and bone which are worn on the under lip on both sides of the mouth. Thus it will be seen that the rising generation is regarded with a full share of reverence, and parents will sometimes even go to great expense to procure amulets or charms from the shamans to preserve the young ones from danger and from the malice of evil spirits.

All the Eskimos are superstitious about death, and although they hold festivals in memory of departed friends, they will generally carry a dying person to some abandoned hut to drag out his days in hunger and neglect. After the death of a husband or wife, the survivor—among the coast tribes, at anyrate—cuts the front hair short and fasts for twenty-five days.

The festivals—which, as we have said, are numerous—are often held in a sort of common hall called the *kashga*, which is built of the same pattern as the semi-subterranean winter-houses, but is often as large as sixty feet square, and twenty or thirty feet high. This *kashga* also serves for various other purposes. It is used for the public bath; for the deliberations of the council of elders in communal questions; for the preparation of skins and the manufacture of sleds; for the reception of visitors; and for the sleeping-place of males who have not huts of their own. The festivals consist of singing and dancing of a primitive character, and then gorging with fish and blubber, with the additional luxury of melted reindeer fat, when it can be procured. All the food, both fish and flesh, goes through some process of cooking before being eaten, although the 'higher' it is, the more it is appreciated.

The tribes of Norton Sound hold a festival every year in October or November in memory of deceased kinsmen, and Petroff thus describes the performances: 'At sunset the men assemble in the *kashga*, and, after a hurried bath, ornament each other by tracing various figures on the naked back with a mixture of oil and charcoal. Two boys, who for this occasion are respectively named the Raven and the Hawk, are in attendance, mixing the paint, &c. Finally, the faces also are thickly smeared; and then the females are summoned into the *kashga*. After a brief lapse of time a noise is heard, shrieks and yells, snorting and roaring; and the disguised men, emerging from the firehole, show their heads above the floor, blowing and puffing like seals. It is impossible to distinguish any complete human figure, as some are crawling with their feet foremost, others running on their hands and feet, while the head of another is seen protruding between the legs of a companion. They all cling together and move in concert like one immense snake. A number of men wear masks representing the heads of animals, and the unsightly beings advance upon the spectators, but chiefly endeavouring to frighten the women, who have no means of escaping molestation except by buying off the actors with presents. Knowing what was before them, they have brought the *kantags* or wooden bowls full of delicious morsels—beluga blubber, walrus-meat, whale-oiled berries, and other dainties. When each of the maskers has eaten and filled a bowl or two with delicacies to take home, they indulge in a pantomime and gesture-play of a highly grotesque character. After completing the ceremony in

the *kashga*, the maskers frequently visit some of the dwellings, and receive gifts in each, the whole performance ending with singing, dancing, and feasting in the *kashga*.'

It is difficult to formulate the religious beliefs of the Eskimos. They regard the shamans as mediators between them and the world of spirits; but it is doubtful whether they believe that the sorcerers can actually control the spirits. Some of these sorcerers are very cunning in tricks of sleight-of-hand; and indeed, unless they are considerably accomplished in such performances, they are little regarded.

Our description is general, because it is impossible to sketch the differences of all the subdivisions of the race. It may be mentioned, however, that the Kaniaks, who people the island of Kadiak and neighbourhood, are of superior physique, although not of *morale*, and were erroneously supposed by the Russians to be the same as the Aleuts, to be presently mentioned. Among the Kaniaks, again, there is a definite tribal authority, and the chiefs are important personages. Then as to superstitions, there is a large tribe on the Kuskokvim river where is found a curious blending of pagan ideas with Christian traditions filtered from the Russian mission further north, for the missionaries themselves never reached the Kuskokvim.

The Aleuts—an interesting people who inhabit a considerable portion of the coasts of the Alaska peninsula, and the adjacent islands called the Aleutian Islands—are the people whom the Russians believed to be of Japanese origin. While the theory seems unfounded, their origin seems yet unsettled, and their own traditions throw little light on the subject. They are quite distinct from the Eskimos, but have evidently had intimate relations with the Eskimos for many generations, if not for centuries. A Russian priest called Veniaminof spent some years on the Aleutian Islands, and carefully collected all the traditions he could from the mouths of the people. These point clearly to a migration at some time from 'a great land' or continent, from which they were driven by wars; but opinions are divided as to whether the continent was Asia or America. The most recent United States explorers are confident that the Aleuts are an American race. Be that as it may, their traditions point to a previous occupation of the islands by some other people, for they say that their grandfathers were told by their grandfathers that they found deserted dwellings on the shores. To what remote period this may point it is impossible to tell, for these primitive races are hopelessly indefinite in matters of chronology.

The Aleuts at one time had certainly some belief in a Creator, but they did not worship him nor 'connect him with the management of the world.' They believed in two classes of spirits, evil and good, and they worshipped what seemed to affect the influence of these spirits. Hence shamanism prevailed, but the shamans themselves were not held in high respect. A belief in the immortality of the soul is argued from the practice which the old Aleuts had of killing a slave on the death of any important member of the tribe, so as to provide attendance for the departed brother in the other world. They also believed in the actual though invisible presence of the

spirits of their departed friends, who help the living in times of danger.

The Aleuts lived in patriarchal tribes, and the head of the family was the chief of the village. These chiefs had distinct authority, but it was not supreme, and did not entitle them to any special honours. When the Russians came, they distinguished some of these chiefs, and tried to give them a political importance. Their present function seems to be to act as overseers in the seal and otter fishing for the American Companies. The Aleuts are not a numerous people, however, and probably do not now exceed two thousand all told.

But while the Aleuts are tending towards civilisation, if they are not actually 'Christianised,' the reverse is the case with the tribes of Athabaskan Indians, who people the Yukon Valley, and are found also in some numbers in both the Kuskokvim and Kadiak divisions. They are distinctly a branch of the great race of North American Indians which extend from the Mackenzie River in the north of the continent to Mexico in the south. At what period they migrated from the interior to the inclement regions of Alaska, it is impossible to say, and their traditions do not help us to guess. They have certainly kept themselves very much to themselves, and have neither intermixed to any great extent with the Eskimos and Aleuts, nor have, until quite recently, held much intercourse with the Russian and American representatives of the white races. As they are now, they probably have been for hundreds, perhaps thousands of years—nomadic, reserved, self-contained, active, hardy, keen-sighted, and fearless—skilful in the chase, and cruel and treacherous in war. They are divided into clans, and are believed to preserve totemism, or the designation of families by the names and emblems of birds and animals, between whom intermarriage is forbidden. They live in log-houses, paint their faces, wear skins in winter, and—except in the extreme north of their range—go with the head uncovered and decorated with feathers. Some of them have traditions of a race of giants 'living to the northward,' who, ages ago, invaded their territory and killed many of their people. Once, they say, one of these giants came down from the mountains, and as he went through the villages, caught up a man in each hand, and after knocking their heads together, placed them inside his 'parka' or skin-coat. Is not this very suggestive of Homer's story of Polyphemus? Other traditions tell of a race of dwarfs away to the north, who may be the small Arctic Eskimos, and of big fish like mountains, which are doubtless the Arctic whales. They also tell of a fearful eruption from one of the volcanic mountains; and it is noteworthy that a similar tradition exists among all the other natives of Alaska.

In the south-eastern division is found another branch of the Indian race—the Thlinkets—and these are, next to the Eskimos, the most numerous of the aborigines of Alaska. They number about seven thousand, and are distributed both on the mainland coast and the islands. Among the Thlinkets, totemism is very pronounced, and forms even a stronger tie than blood relationship. The totem clans are named Raven, Bear, Wolf, Whale, and so on; and as men may not marry in their

own clans, the children belong to the clan of the mother. The Thlinkets are the most advanced of all the races we have mentioned, as they have also the best section of Alaska for their habitat. They are clever navigators in their canoes, are expert fishers and hunters, dexterous in carving and plaiting, skilful in building, and 'cute in trade.

Thlinket traditions tell of two heroes who, at the beginning of the world, fought with the spirits of darkness for the future good of mankind. These two heroes or gods were the founders of the Raven and the Wolf clans; but neither the raven nor the wolf occupies any important place in their mythology. Their traditions also point to a migration from the interior of America, and a similarity has been traced between their language and that of the Apache and Aztec tribes: they have all the physical characteristics of the average North American Indian, and their prevailing vice is indolence.

As regards religion, we find among the Thlinket tribes a distinct notion of a Creator. The most important personage in their mythology is Yeshl, who was the ancestor of the Raven clan, and who seems to be credited with the creation of all physical objects. He is the friend of man, existed before he was born, never grows old, and never dies. He sends reminders of his existence with the east wind, which is supposed to blow from his abode. He has a son, who is even fonder of man than Yeshl himself, and frequently intercedes when the father is filled with wrath against the people for ill-doing. We have here a striking approach to certain peculiarities of the Christian faith.

The Thlinkets, however, do not believe that all men sprang from the same stock, but that Yeshl travelled from land to land, and made a new man in each with a different language. After he had finished his work, he said: 'I am now going away, but my eye will be always on you. If you live wicked lives, you cannot come to me, as the good and brave only can live in my place.' Sir James Douglas, of the Hudson's Bay Company, says that 'the Thlinkets think that there is a future state of retributive rewards and punishments. After death, the souls of men ascend through successive stages one over another, like the stories of a house, to the highest heaven, where they find a strong gate guarded by a giant, who knows the name of every spirit that makes its appearance there. After proclaiming the name aloud, he proceeds to question the spirit regarding its past life, either by receiving it into heaven, or driving it back to the inferior stages, where it wanders about comfortless amid yawning gulfs, opening before it at every step. The knowledge of these things has no perceptible effect on their conduct; they steal, cheat, and lie whenever they feel an interest in doing so, without any visible apprehension of incurring Yeshl's displeasure. They admit that theft, falsehood, and roguery are criminal, but nevertheless have recourse to them without hesitation whenever it suits their purpose.'

Here we must close our rapid and necessarily imperfect sketch of the strange Peoples of Fur-land. We have said enough to show how much of interest there is about them, and how many ethnological and mythological questions they suggest. Even now, they are as

little known as the strange weird regions in which they hunt and fish, are born, marry, fight, toil, gorge, and die. In the great struggle for existence, surely their part is neither without importance nor without instruction.

HELEN'S ESCAPE.

BY H. F. ABELL.

IN FOUR CHAPTERS.—CHAP. I.

PING! crash! and, shattered into a thousand pieces, down came the bust of Molière which stood at the top of the bookcase in my room at No. 5 Rue de Douai, Paris. This was on the evening of May 27, 1871, and the Commune was desperately gasping its last breath in the ubiquitous presence of the victorious Versailles troops of Macmahon.

'Better the bust of Molière than my head,' I remarked to myself as I quitted my easel, at which I was trying to work, and went to the window to peer out into the street. The scene which met my furtive gaze through the half-opened *persiennes* I can never forget. Almost under my window—for No. 5 was but the third house from the corner of the street—was what had been a large and well-constructed barricade, composed of street stones piled around a Clichy-Odéon omnibus, a couple of nightcarts, and a miscellaneous heap of obstructions—its front facing the Rue Laval, its two sides commanding the Rue Pigalle, and its rear towards the Rue de Douai. All about it were stretched the corpses of men, in blue or white blouses or hybrid uniforms, who had fallen during the night; and against the walls of the opposite houses were half-a-dozen wretches slowly dying from their wounds, and calling aloud to be put out of their misery. Everywhere else, rifles, accoutrements, shattered fragments of the barricade, empty wine bottles, and—blood.

I had been a close prisoner in the house for four days; I had been made to assist in the construction of the barricade described above, in spite of my plea of 'Civis Britannicus sum;' but I had determined not to fight, and, favoured by darkness and the drunkenness of the Communist sentries, had managed to slip home unobserved. The bullet which had destroyed Molière was the first which had fairly entered my room, although, during the three preceding days, there had been severe fighting in the street and my *persiennes* were riddled almost to fragments. I had only ventured to look out once before, for the fate of those who looked out of a window dangled before my eyes in the shape of two or three motionless heads and arms hanging over window ledges; but the arrival of the bullet stimulated my curiosity, and I remained, lying flat on the balcony, peeping through the iron-work of its railing. There were not more than a score of men left in the dilapidated barricade, and these were either too drunk or too desperate to fly. About four hundred yards up the Rue Laval I saw a blue mass, tipped with steel, which I guessed to be the Versailles troops advancing from their capture of the Buttes Chaumont and the Belleville heights, to the destruction of what was almost the last hornet's nest. Presently, there was a tremendous volley; the men

in the barricade yelled and crouched down, rose up and fired. Then the street was filled with white smoke; but I could hear the clatter of feet advancing at the *pas gymnastique*, followed by yells of defiance, cries of agony, the crash of falling obstacles, and more volleys. The smoke cleared, the 'Reds' were rushing along the street past my door, followed by the cheering troops. Now and then, a man threw up his arms and fell flat on his face; the others staggered on; there were more cries of agony, which told me that the bayonet was doing its sickening work. Then all was over, and the Commune was dead as far as fighting was concerned, although the lurid glare reflected on the evening sky in half-a-dozen directions sufficiently proclaimed that it had not died without a terrible Parthian shot.

We—that is, my Italian landlord and I, the only occupants of a house usually filled from basement to attics with artists and art students—had not an atom of food or a drop of drink in the house; and I determined to get as far as the *charcutier* at the corner—now opened for the benefit of the Versailles sentries grouped all about—for the purpose of taking in supplies. So I crept out cautiously—for I knew that the victors, maddened by resistance and bloodshed, would not hesitate to shoot upon mere suspicion—bought what I required, and returned, having been absent half an hour.

It was half-dark when I reached my room again, and the weird gray light which came from the west, and made a strange pattern on the floor as it pierced my battered *persiennes*, seemed an appropriate tint for the close of such an awful day. I felt its influence, and, safe as I was, moved gently, as in a house of death. Then I was amazed to see a man sitting, or rather lying, in my armchair. When I approached nearer, I saw that he was wounded and insensible; that his face and his left arm were bound up in bloody rags, and that his tattered clothing was besmeared with mud and chalk and blood. I poured some brandy down his throat, and he revived. 'Thank God!' he exclaimed—'thank God!' But he was so exhausted that his head sunk back again. He had uttered those words in English, and, astonished as I was to find him in my room at all, I was still more so when I saw he was a fellow-countryman.

Presently he made an effort and sat up. 'You're all right,' I said, as I noticed he looked fearfully and anxiously around, as if pursued; 'you'll be better when you've had something to eat and drink.'

His face brightened at the sound of my English speech. 'You are an Englishman,' he said. 'I am glad. These brutes have nearly done for me. Look here!'—as he spoke, he undid the bandage from his hand—'that's a bayonet-wound.' As he showed it, a piece of glass fell from his sleeve or his bandage to the ground. Seeing it, he added: 'And I had to jump clean through a window. But I'm safe here? You won't give me up?'

'Of course I won't,' I replied. 'Why should I?'

'Well, you see I'm a banker here. I heard that the Commune had made a raid on more than one business house for what they call "contributions to the holy cause of universal liberty." I

happened to have a lot of securities which had been deposited with me for safety by wealthy Parisians. I heard that the Communists were on the scent, and I escaped with them just in time. The soldiers entered the house just as I left it, chased me, fired at me, wounded me in the head and hand, and I got into a shop. I was followed there, fired at again, and just jumped through the window in time to avoid an ugly push with a bayonet. But I'm not quite comfortable, for they might be here at any moment.'

His mind was evidently unhinged by what he had gone through; for, in spite of my assurances that the Commune was a thing of the past, and that order was re-established, whilst he ate and drank with avidity what I set before him, at every unusual sound he started to his feet in the greatest alarm. However, food and drink gave him courage; and although he refused to have his wounds dressed, and remained with his face almost hidden in hideous bandages, he accepted my invitation to remain where he was for the night. Over a cigar and a bottle of Médoc I found him to be an exceptionally intelligent and well-informed man, who had been at an English public school and university, and had been settled in Paris many years. Personally, he said, he was ruined by the Commune; but he was glad to have been able to save the property of his clients, and had no doubt but that they would make him some compensation for the losses he had sustained in guarding their interests.

He refused to occupy my spare room, but preferred to sleep in my armchair; and at midnight, when we separated, he said: 'My name is Rayne—Dixon Rayne, of the firm of Rayne & Company, Rue le Pelletier. I don't know how I can ever repay you adequately for your kindness to me to-night; but be sure that I shall endeavour to do so.'

When I entered the room the next morning, he was gone.

Now, there were two or three little things about Mr Rayne and the circumstances of his escape, which, coupled with the fact of his sudden disappearance, struck me as being rather odd, and instinctively I felt rather relieved when he was gone. Of course his story was plausible enough, for I knew that the Communists had not hesitated to lay their hands upon all the money and valuables and securities they could find, under the plea of *pro bono publico*, but in reality for personal enrichment. But why he should have displayed such fear of arrest was strange, when he must have known that all cause for fear was removed by the triumph of the Versailles troops. Again, he did not ask my name, as a man in receipt of a kindness and wishful to repay it would generally do. Neither, upon searching the Directory for Paris, could I find any such firm as Rayne & Company either in the Rue le Pelletier or out of it. Lastly, what little I could see of my visitor's face for the rags which he so assiduously preserved, did not impress me, although I knew very well that in a hurried flight for life, Apollo himself would assuredly be shorn of much of his natural beauty.

However, Mr Rayne, good or bad, was gone, and there was an end of it, as I thought, and I was soon too busily occupied with my own affairs

to trouble my head about him. Shortly afterwards, I ventured out for a tour of exploration amidst the ruins of defaced, despoiled Paris, perhaps also with a view to the reproduction upon canvas of such incidents as I had witnessed or could imagine. When I returned home, I found an official in police uniform in my room. 'Monsieur is English?' he asked.

I admitted the fact.

'Has Monsieur any countrymen of his in the house or anywhere about?'

I replied that I knew of none.

The official described himself as *désolée*, but it was his duty to search. Accordingly, he searched high and low, cupboard and drawer, passage and closet. 'I am obliged to Monsieur,' he said as he re-entered my studio. Suddenly, he stooped and picked up from the floor the piece of glass which had fallen from Mr Rayne's arm bandage; and I noticed that it was stained glass of a yellow colour, such as may be seen sometimes in the staircase windows of Parisian houses, but never in a shop front.

The officer looked keenly at me as he held the glass, and his remarkable politeness at once gave way to an official abruptness which was evidently more natural to him.

'How did this come here?' he asked. I suppose I must have looked almost guilty, for he repeated the question in a more peremptory manner, as I stood wondering how I should answer; so there was nothing to be done but to tell him all that had happened on the night of Rayne's arrival. After a series of minute questions concerning my visitor, the purport of which I could not guess, and my answers to which he carefully noted down, he left me.

I lit a pipe and pondered over this strange matter for an hour; then I thought I would go to breakfast on the boulevards. Close to the street door was a tall man in ordinary civilian dress, smoking a cigar, and apparently interested in the work of demolition of the barricade which was going on. He glanced carelessly at me, and I passed on; but on reaching the crossing at the church of Notre-Dame de Lorette, I looked round to see if the way was clear, and behold he was following me at a distance of fifty yards, and so on down the Rue Lafitte, on to the boulevard, and over to the Café du Cardinal, so that I knew I was being watched. The same man, unless he was disguised, was not engaged on the job again; but I seemed to feel instinctively that the eye of the law was on me, and some one was intrusted with the duty of observing my slightest movements.

Finally, to cut a long story short, I was visited by two gentlemen in mufti, although they were clearly officials, who drove with me to the depot of the Prefecture of Police, where I was submitted to a searching examination by a magistrate concerning Mr Rayne, and allowed to go, after I had been actually thanked and apologised to for the trouble and inconvenience to which I had been put.

Piecing all the evidence together with the nature of the questions put to me, I came to the conclusion that Mr Rayne must have been a political offender, or a spy, or perhaps even a Communist leader.

In three weeks' time I had cleared up my

affairs in Paris, and after an unexpectedly prolonged sojourn in the city of famine and bloodshed, returned gladly enough to my own home amidst the Surrey hills.

IMPROVEMENTS IN TANNING.

NOTHING is more remarkable in the history of the industrial arts than the fact that the most ancient of these arts—that of preparing skins for clothing—has stood still with Chinese persistency, while those of spinning and weaving have advanced by leaps and bounds. Skins of beasts killed in the chase were, without doubt, the primitive clothing of our race. Some process, therefore, akin to tanning must have been pursued long before the days of Simon the tanner, in order to prevent the skins from putrefying and to render them durable. As it was in the beginning, so it is now; a substance known as tannin, the active principle of tannic acid, has been depended upon for the conversion of skins into leather. Tannic acid is widely spread through the vegetable world in the bark, leaves, and fruits of plants, the best known being that of oak-bark.

The art of leather-making is simple. The skins are unhaired and 'fleshed' or cleaned by removing the fatty matters that cling to the under surface. Left to soak in an infusion of tannin, time will do the rest. The art of the tanner is to expedite this process. In order to loosen the hair by softening the hides, they are steeped in lime-pits, and, when 'handled' or hooked out, are found to be in the state of gelatine. When cleansed from the lime—the most troublesome part of the process—the pores of the skins are greedy to absorb the tannin; and in a period ranging from weeks to years, a tannate of gelatine is formed, or what we call leather. On a small scale we may make leather in a teacup; for any animal jelly dissolved in water will fall in hardened flakes of true leather on the addition of a few drops of tannic acid.

Science has ransacked the world to find tanning substances of quicker action than those in common use; but oak-bark maintains its rights, and tanners come back to it after repeated trials with a long list of other materials. Time seems to be a vital element in tanning, and what has been gained in time has been at the cost, as a rule, of quality in the product.

The lime in the hides has much to do with the after-processes. It is the great evil which tanners have to contend with, since no known method, hitherto, has been able to free the skins entirely from its presence. The plan followed from time beyond memory has been to soak and wash the fleshed skins in a bath of *bate* or *pure*, a euphemism for the refuse of dogs and other animals. How, with our strides in chemistry, a manufacture, ranking as one of the highest national importance, should, for ages, have been dependent upon a practice exciting disgust, which even apprenticeship and journey-work cannot conquer, is one of the curiosities of industrial life.

Relief hails from Australia. In return for the cattle with which we have replenished the empire colony, our brothers over there have long sent us hides and skins, and end by teaching us how to dress them. Mr E. P. Nesbit, a schoolmaster

of South Australia, and a gentleman of hereditary scientific tastes, since he is a descendant of the author of *Nesbit's Mensuration*, a work known in every English school, has taken the tanners in hand, and offers to teach them thrift in leather-making. Some time ago he invited a number of manufacturers and men of science to an exhibition of a new method of unliming hides and skins at the tanneries of Messrs Etty and Barrow of Grange Walk, Bermondsey. The result was a perfect success and full of promise. In less than an hour, instead of days or weeks, hides submitted to the new treatment were rendered absolutely free from lime, as well as from what the craft expressively calls 'muck'—that is, fat and dirt, which more or less prevail in all hides and skins, and interfere with good tanning. Hitherto, mechanical means of repeated washings have been trusted to for extracting the lime which the skins imbibe. Animal refuse, as we have said, has been used to soften the water of the bath, and thus to open the pores of the skins, and the lime which they contained was, as it were, rinsed out, not dissolved, since it is soluble in water to a very small degree. In districts where the water is soft, this cleansing of the hides is easier without *bate* than in chalky districts, where the water is hard, the effect of the carbonate of lime in the water being to close the pores; and extra *bate* is required, sometimes even then without effect.

The new method of unliming hides and skins, patented by Mr E. P. Nesbit, can hardly be called a discovery or an invention. It is 'a happy thought' which strikes the mind of intelligence in the midst of customs petrified by tradition; an example of applied science, an elementary principle of chemistry put into industrial practice, and thereby lifting a rule of thumb into the region of the skilled arts. The 'mere schoolboy' knows that lime dissolves very slightly in water, but that it becomes immediately soluble if the water is charged with carbonic acid. The principle is exemplified in the common custom of softening hard water by adding more of the lime which made it hard. But, as the patentee naively states, the tanners knew the difficulty, but did not know the remedy; the chemists knew the remedy, but did not know the difficulty.

Let a short colloquy between the writer and the patentee explain itself.

'How did the idea come into your head?'

'Why, I got acquainted with an Australian tanner who happened to speak of the trouble his craft had in getting rid of the lime in the hides. That ought not to be difficult, I told him. Let me try my hand. With that I took a small piece of the saturated skin, then put it into a soda-water bottle with cold water, and charged the contents with carbonic acid gas, in the usual way of making soda-water. I took the skin back the next day, looking quite clean and plumped out. Is there any lime in that? "Not a particle," was the answer, after testing.—"Then I have got at it," said I; "and what can be done on a small scale can be done on a large."—"You had better put the plan into practice here," said my friend the tanner.—"No, indeed," I rejoined; "I am off at once to England, the great leather market of the world."

British tanners are a close corporation, conservatively standing in the old ways, and were not ready to believe in an outsider who professed to teach them their trade, which they had followed since the world was young. The patentee was, however, happy enough to meet with one or two enterprising men of business, as also with a capitalist, Mr Max Strauss, of Holburn Viaduct, who made himself master of the subject, and about a year ago, brought the working of the process to an issue in the tanneries of Messrs Barrow Brothers of Bermondsey. Since then, Messrs Etty and G. B. Barrow, of Grange Walk, have undertaken the agency for the production of leather on the new principle, to witness the working of which drew together the influential company referred to.

At this exhibition of the new process, the little slip of moist skin and the soda-water bottle were represented by a heap of stout limed hides, 'fleshed' and unhaird, in readiness the day before; and by a tank of cold water capable of immersing one hundred and fifty hides, corked down, so to speak, or better, say, with a 'patent stopper,' of a heavy lid, bolted down with stout iron screws to render the tank air-tight when full of hides. A tube through this, leading to the bottom of the tank, is put in connection with a gas generator, to which our attention is next called. The apparatus employed, constructed by Messrs Hayworth, Tyler, & Co., engineers, and as simple in principle as every part of the process, comprises a generator, gasometer, and small steam pumping-engine. The generator is of iron, charged with fourteen pounds of whiting, upon which, while kept stirred, a thin stream of dilute sulphuric acid trickles to about the same weight in the course of an hour. Carbonic acid gas generates rapidly, as is seen by the ascent of the gasometer, and is driven forward by the pumping-engine to the tank, which it enters through the pipe opening at the bottom.

A slight hitch or two, easily obviated, so far from proving a disadvantage, still more conclusively confirmed the correctness of the principle. The lid of the tank, from some trifling defect of the vulcanite fittings, was not quite air-tight, whence the pressure of gas upon the hides was less than advised; while the generator had to be charged twice instead of once with whiting. A rough-and-ready experiment pardonably takes more time in preliminaries than when an industrial process is in full working and automatic order. Three-quarters of an hour passed in these observations, out of which we may assume that the hides were subjected to the action of the carbonic acid a full half-hour, or just half the normal time. This was meant to be a crucial test of the value of the process. The tank was opened and the hides hauled out, looking deceptively white and clean; for, upon scudding or scraping one of them upon the curved 'beam' used by tanners, so much 'muck'—namely, dirt and yellow grease—was pressed out, that the experts present were fain to own that such rapid and perfect cleansing had never before been accomplished. The clear cold tank-water was now cloudy-white with lime.

Was any lime left in the hides? The test of lime is the readiness of the hide to take the tannin. If free from lime, it is thirsty for the

infusion; if not free, the absorption is a long and tiresome process, beginning with a liquor of nearly spent tan, and then successive immersions for many weeks or months in liquors of higher and higher degrees of strength. The operative cut off a corner of the hide, held it for a couple of minutes in a strong infusion of tan, and handed it round for inspection. It had taken the tan at once, and at least three weeks' action upon the hide was condensed into two minutes. A remaining question as to the quality of the leather thus produced proved equally satisfactory. The curried hides and skins were of fine grain and beautifully supple. Their excellence has been particularly shown in their suitability for enamelled and japanned leathers for bags and patent-leather boots.

The impression made upon those who witnessed the process was, that this ancient art is on the eve of a great transformation both scientific and economic, which will raise its rank among our skilled industries and notably advance the national well-being. Mr Nesbit computes that, at the lowest, one-third of the time of leather-making will be saved. This alone must release some millions of the vast capital now sunk in the manufacture, to fructify in other industrial directions. Further, the cost of plant and material is brought to a minimum—the whiting and sulphuric acid are almost too cheap to enter into account, the unliming of five hundred hides being done for eighteenpence; while the mechanical appliances involve the most moderate outlay.

PARSON VENABLES' ADVENTURE.

IN TWO CHAPTERS.—CHAP. I.

ST FIMBARRUS is the name of a lonely little parish on a hillside in a distant county. The country round about is all wild moorland. From the church porch of St Fimbarrus you can see many miles of undulating downs, now rising into hills of respectable elevation, and again sinking into valleys, through which a little stream brawls among stunted trees. There are no trees in St Fimbarrus itself, save a few weakly firs in the vicar's garden, which he nurses with sedulous care, in the hope that they may one day afford some shelter from the fierce winds that sweep down the glens on every side towards the vicarage. It is a hope unlikely to be realised; certainly, its fulfilment is so distant that ere it comes, the vicar will have been laid in that other tenement of his, within sight of his study window, which he purchased when his last child was laid there.

It was a bright afternoon in May, and the vicar stood on the gravel sweep before his house, scanning the sky anxiously. He turned to gaze successively at each quarter of the heavens, inhaled rather dubiously several large mouthfuls of the air, to satisfy himself whether it tasted salt, as it must if the wind blew from the sea, the rainy quarter at St Fimbarrus; and then, with a brighter countenance, he re-entered the house.

'You may put on your things, Anna,' he cried out cheerfully as he crossed the hall, 'and tell Hugh to bring the pony round.'

'Then I shall get my cross-stitch pattern, after all; and I can talk with Mrs Hartle about the

butter.' So saying, Mrs Venables, in a state of some excitement, gathered up her shawl, her spectacles, and her knitting, on which she had been employed, in preparation for going up-stairs to make ready for the desired journey.

'You can talk to her about anything you please, my dear,' said the vicar, rather testily, for he was in truth somewhat tired of hearing of his wife's difficulties with regard to the cross-stitch pattern and the butter.

'I shall talk to her about those two things, and nothing else,' said the old lady with determination; 'we shan't have more than enough time to settle them.'

'Well, well, my dear, as long as you are satisfied,' returned the vicar.—'Will you be ready in ten minutes?'

'Not if you flurry me with calling to know how long I shall be. I have so many things to remember, and I can't tell what I've done with my tablets.—Belinda! Where is Belinda?—Oh, very well! I'm coming up-stairs, my love.'

The vicar went out again into the sunshine. He had not taken many turns along the walk beneath the windows of the house, when a crunching sound of wheels on the gravel announced the arrival of the pony.

'How is he to-day, Hugh?' asked the vicar. 'Pretty quiet?'

'Too much oats inside him, sir,' said the man, touching his hat. 'Oats goes to friskiness.'

'I'm afraid you're right, Hugh,' the vicar answered, observing how impatiently the pony was stamping on the gravel.—'Poor Charles! good Charles!' and he attempted to stroke the animal's nose—a compliment which Charles resented by first tossing his head, as if he wished to feel his master's fingers between his teeth, and then starting off at full racing speed in the direction of the open gateway. The vicar hung on to the back of the chaise. Hugh, muttering blasphemies, made desperate efforts to catch 'good Charles's' head; while in the midst of the confusion, a window was thrown up and Mrs Venables cried loudly: 'Stop, stop! We're not nearly ready yet.'

'I wish you'd make haste, my dear,' returned the vicar; 'this restive animal has nearly torn my arms out of the sockets.'

'Nonsense! You must keep him quiet.'

'That's more easily said than done; but we will try.'

'It's very easy, I'm sure,' returned the lady. 'Men have no tact. I'll come down presently with an apple.'

The vicar looked at Hugh and shook his head somewhat dubiously; he doubted the virtue of the apple.

'If the missus would leave his feed to me, sir, he wouldn't be half so lively,' remarked Hugh; 'but when ladies will go and fill his box with a double portion of oats, so as he's a-eatin' all day, and never goin' out at all'—

'I know—I know,' the vicar said hastily. 'Ladies don't understand horse-flesh, Hugh.'

'They don't,' rejoined the man gruffly.

At this juncture, Mrs Venables sallied forth, accompanied by her niece Belinda, who carried several thick shawls and a heavy carriage rug.

'Shall we want all those wraps on such a bright day?' the vicar asked.

'Yes; indeed we shall. It will be very cold when the sun goes in;' and with that, Mrs Venables took the wraps from her niece and stowed them carefully in the back seat. After satisfying herself that they were not likely to fall out, she went up to the pony's head. 'Naughty Charles!' she said, in a coaxing voice—'bad Charles, to startle your good mistress so, and pull your master's arms out of the sockets.'

This affectionate adjuration apparently did not penetrate to Charles's heart, for he whisked his head about, at the imminent risk of striking his mistress in the face; and being somewhat elated at the result of his last manoeuvre, he was steadily endeavouring to get on his hind-legs, with the apparent intention of dancing into the town.

'Better not touch him, ma'am,' advised Hugh. 'I'll hold him fast enough while you get in.'

'He seems quite excited to-day,' said Mrs Venables, a little nervously.—'I think you had better drive him, Theophilus.'

'O yes, Uncle Theo,' Miss Belinda interposed; 'do drive him yourself—he seems so very wild.'

'Stuff!' said the vicar. 'If Charles is at all fresh, Hugh's is a much safer hand on the reins than mine.—Get in, my dear, or we shall not reach the town to-day.'

But as Mrs Venables placed her foot upon the step, Charles made a sudden start, which, though checked on the instant by a sharp tug at his head, was almost sufficient to throw the old lady down.

'Theophilus,' she said, retreating two or three steps from the pony-carriage, and looking at her husband with a face full of apprehension, 'this pony is not himself to-day, and I must insist on your driving.'

'I know what's the matter with him, aunt,' said Miss Belinda mysteriously. 'Some pixy's got into him. I've seen a cow go on just like that at milking-time, and they always know then that the pixies are about the farm.'

The vicar turned round angrily. 'How often am I to tell you, Belinda, that I won't have those silly tales repeated about my house! Is it possible for me, do you think, to expel superstition from the minds of the honest people over whom I am set, if one of my own family spreads it abroad?'

'Never mind, never mind,' interposed Mrs Venables. 'Belinda didn't mean any harm. It's quite likely she may be right too; and that's another reason why you should drive, Theophilus. I always feel so safe when you have the reins.'

'It's not at all a well-grounded feeling, my dear,' replied the vicar, 'if you only knew it. You are vastly safer with Hugh.—But there; I give way.—Hugh, you must stay at home. Look out for us about half-past six.'

'And, Belinda,' called Mrs Venables as the pony-carriage passed out on to the road, 'have a little fire, and keep your uncle's slippers warm.'

As soon as Charles emerged upon the high-road, the evil spirit came forth from him and he fell into a steady trot.

'There, you see, Theophilus; he is quite quiet now; I knew he would be with you.'

The vicar could not repress a slight feeling of triumph as he contrasted the present demure conduct of the pony with his late obstreperous behaviour. 'He certainly is,' he answered. 'I begin to think I must have some of the qualities of a professional whip.'

Charles's conduct was indeed exemplary; and a steady uneventful drive of about an hour, all down hill, brought the vicar and his wife to the top of the steep descent above the town.

'There is Dr Hartle!' exclaimed Mrs Venables excitedly. 'Don't you think he is growing very gray?'

'Not more so than he has been for the last ten years, my dear.—How are you, Hartle?'

The doctor, mounted on a stout brown cob, had ridden up alongside the vicar's carriage and was exchanging greetings. 'Jane will be delighted to see you,' said he. 'She has been complaining for three days past that she sees no visitors now. You will stay and take tea with us?'

The vicar demurred to this proposal, and the point was not settled when they arrived at the door of the doctor's pretty dwelling.

'Jane!' cried the doctor, pushing open the door of his parlour: 'here is Mrs Venables.—I am awfully glad you came in to-day, Venables; for I have just got a batch of music which I want to show you.'

'I can't think,' said the vicar, 'why you go foraging among all this newfangled jingle, when you don't half know the works of the old men who really understood where noise begins and music ends.'

'I declare,' said the doctor energetically, 'if a month passes without my seeing you, Venables, you retrograde in the most shocking way. Let me see—March, April. It is barely five weeks since we spent that delightful evening together where you really did begin to see what fine work had been turned out in the last thirty years.'

'Yes, I know,' the vicar admitted; 'but when I came to think it over, I perceived that I was wrong.'

'I quite expected it!' ejaculated Dr Hartle. 'I knew you would go back to your musty fugues and canons. Well, I shall have to convert you again, that's all. Here is a batch of songs by Liszt now. Read that over to yourself, and then I'll sing it.'

'Liszt?' said Mr Venables, taking the sheet of music. 'He was a man of deplorable character.'

The doctor muttered something beneath his breath, at which his friend looked up hastily; but he was wise enough not to repeat it.

'This is very strange and eccentric music,' said the vicar, after carefully perusing the song; 'and the harmonies seem against all rule. Here is the pedal actually used in a descending scale.'

'My dear sir, how often must I tell you that the breach of formal rules never can condemn any music if the effect is good! Now, listen!' The doctor possessed a very sweet tenor, not powerful, but admirably trained, and he rendered the song extremely well.

'There's merit about that music,' the vicar said; 'but what a pity that a man of talent should allow himself such license.'

This remark led to a long discussion. It was an old dispute, and every inch of the ground of battle was familiar to both the combatants. A vast array of authorities was marshalled; hosts of opinions, of every degree of weight, were adduced; volumes of reference were piled up on the table to a mountainous height; phrases without number were hummed, sung, played on

the doctor's excellent piano, or even drummed out on the table. The afternoon wore away, and neither of the disputants was in the least inclined to admit himself worsted, when the town clock chimed six, and the vicar, starting up, declared he had had no idea it was so late, and that he must not lose a moment in setting out on his homeward journey.

'I should be very sorry to be out after dark,' he said. 'The roads across the downs are very confusing in a bad light.'

'Pooh! You should know them well enough. There's an excellent light, too, till nearly eight o'clock now.—What, won't you be convinced? Then, I'll order round your pony.—Where is Mrs Venables?'

Where Mrs Venables was, nobody seemed to know. The housemaid was certain she had heard the two ladies talking up-stairs not ten minutes before, while the cook was equally positive that she had seen them walking in the garden. It was quickly ascertained that they were not in either of these places now, and messengers were despatched in every direction in which it seemed likely they had gone. The pony had been at the door for twenty minutes, however, and Mr Venables was in a fever of impatience to be gone, before his wife and Mrs Hartle came strolling slowly down the street talking as leisurely as if nobody had been waiting for them.

The vicar was a man of temper; he forbore to reproach his wife, and merely pointed out to her that in a few minutes the town clock would sound half-past six, the hour at which they had arranged to be at home.

'Yes; I knew it would be so,' said the old lady calmly; 'we always are late when you begin to quarrel with Dr Hartle about your crotchets and your quavers.'

'My dear,' rejoined the vicar, with just the smallest tinge of reproach in his voice, 'if you had been ready when I was, we should have reached the top of Dumblely Hill by this time.'

'You shan't throw the fault on me, Theophilus,' said his wife firmly. 'You were to blame, and you alone.—Now, listen to what Mrs Hartle told me.'

Mrs Hartle's news proved interesting enough to beguile the tedium of the weary climb up Dumblely Hill; and as Charles toiled slowly across the road from side to side of the steep ascent, neither his master nor his mistress observed that thick clouds had obscured the setting sun and that the air was growing dense and moist. It was only when, on reaching the hilltop, the vicar shook out the reins and urged Charles forward, that he looked back and saw that the town was hidden from sight by wreaths of mist. The hedgerows, too, were beginning to look ghostly; little drifts of cloud were stealing along the hollows; and the vicar, as he glanced uneasily about him, could not conceal from himself the conviction that before they could reach the vicarage the fog must have surrounded them altogether.

'I wish we were at home,' he said, cracking his whip; 'or, at all events, over the next hill.'

'Oh, I don't think much of this,' replied Mrs Venables cheerfully. 'We have been out when

it was much thicker. I haven't told you half my news yet.—Do you know, Robert Tomkins is going to emigrate! Think of that—with all those young children. I call it infamous!

'If he can't get anything to do here?' suggested the vicar, glancing nervously over his shoulder.

This remark led Mrs Venables off into a tirade on the evils of emigration, which she regarded as a species of impiety, an unwarrantable interference with the decrees of providence, who knew much better where a man was likely to thrive than his own judgment could tell him. The good old lady was in the habit of enforcing this belief with copious extracts, not only from various pious writers, but also from her own experience, and in this rhetorical exercise she became so much engrossed that she observed nothing of the thickening of the mist to a solid wall around them, nor of the slackening of Charles's pace as his master's nervous hand now urged him forward, now checked him sharply with a momentary fear that he had lost the road.

'I don't know what to make of this,' the vicar exclaimed at last; and, handing over the reins to his wife, he sprang out. 'I can't tell what road we are in.'

The fog had indeed become so dense that the borders of the road were not in sight; only a little space of a few feet immediately around the carriage was visible; all beyond was a uniform mass of cloud.

'Don't go out of sight, Theophilus,' Mrs Venables entreated; 'I shall be very frightened if you do.'

'Nonsense!' replied the vicar, who was groping about in the mist. 'How am I to ascertain where we are unless I can find some landmark?'

'But you can do that in the carriage. If you will only get in, we can drive up to the edge of the road and see quite well. If you go out into the mist, you will never get back to me again.'

The vicar returned with a dejected countenance and climbed into his seat.

'I think I saw the great quoit which was overturned by the storm last February,' he said; 'but one looks so much like another in this light.—If only Hugh were with us!'

AMUSING ANSWERS.

OUR courts of law have furnished us at various times with very witty and amusing remarks, lawyers and prisoners alike being guilty on this score. Doubtless, every one has heard of the Irishman, who, in reply to the question, 'Guilty or not guilty?' said 'he would like to hear the evidence before he would plead.' A magistrate in another case was dealing with a vagrant, and in a severe tone addressed him thus: 'You have been up before me half-a-dozen times this year;' thereby giving him to understand that he had appeared too often on the scene. The prisoner, however, was equal to the occasion, for he replied: 'Come, now, judge—none of that. Every time I've been here, I've seen you here. You are here more than I am. People who live in glass houses shouldn't throw stones.'

Curran, the Irish advocate, was one day examining a witness, and failing to get a direct answer, said: 'There is no use in asking you questions, for I see the villain in your face.'—'Do you, sir?' said the man, with a smile. 'Faix, I never knew before that my face was a looking-glass.' On another occasion, he was out walking with a friend who was extremely punctilious in his conversation. The latter, hearing a person near him say curocity for curiosity, exclaimed: 'How that man murders the English language!'—'Not so bad as that,' replied Curran; 'he has only knocked an i out!'

'Prisoner at the bar,' said a judge, 'is there anything you would wish to say before sentence is passed upon you?'—The prisoner looked towards the door, and remarked that he would like to say 'Good-evening, if it was agreeable to the company.'

'I remember,' says Lord Eldon, 'Mr Justice Gould trying a case at York, and when he had proceeded for about two hours, he observed: 'Here are only eleven jurymen in the box; where is the twelfth?'—'Please you, my lord,' said one of the eleven, 'he has gone away about some business; but he has left his verdict with me.'

This is almost on a par with a case tried in one of the Lancashire courts, when Serjeant Cross was a resident barrister in that county. The jury having consulted and agreed upon their verdict, were addressed by the clerk of the peace: 'How say you, gentlemen of the jury; do you find for the plaintiff or the defendant?'

'What sayn yo? I dunnot understand,' said the foreman.

'Why, as you have decided, all I want to know is, whether your verdict is for the plaintiff or the defendant?'

The foreman was still greatly embarrassed; but he replied: 'Whoy, I raly dunnot know, but we're for him as Mester Cross is for!'

Lord Cockburn's looks, tones, language, and manner were always such as to make one think that he believed every word he said. On one occasion, before he was raised to the Bench, when defending a murderer, although he failed to convince the judge and jurymen of the innocence of his client, yet he convinced the murderer himself that he was innocent. Sentence of death was pronounced, and the day of execution fixed for, say, the 20th January. As Lord Cockburn was passing the condemned man, the latter seized him by the gown, saying: 'I have not got justice, Mr Cockburn—I have not got justice.' To this the advocate coolly replied: 'Perhaps not; but you'll get it on the 20th of January.'

Witty and humorous replies, however, are not confined to law-courts, so we may leave the judges and their satellites and gather up a few fragments elsewhere. An Irish recruit about to be inspected by Frederick the Great, was told that he would be asked these questions: How old are you? How long have you been in the service? Are you content with your pay and rations? He prepared his answers accordingly. It so happened, however, that the king began with the second question: 'How long have you been in the service?' Paddy glibly replied: 'Twenty years.'—'Why,' said the king, 'how old are you?'—

'Six months.'—'Six months!' exclaimed the king; 'surely either you or I must be mad.'—'Yes, both, Your Majesty'—a confession scarcely anticipated by the royal examiner.

A good story is told of a general and his wife, resident in Ireland, who were constantly pestered by a beggar woman to whom they had been very generous. One morning, at the accustomed hour, when the lady was getting into her carriage, the old woman began: 'Agh! my lady, success to yer ladyship, and success to yer honour's honour, this morning, of all the days in the year, for sure didn't I drame last night that her ladyship gave me a pound of tay, and yer honour gave me a pound of tobacco!'

'But, my good woman,' said the general, 'do you not know that dreams always go by the rule of contrary?'

'Do they so, plase yer honour?' rejoined the old woman. 'Then, it must be yer honour that will give me the tay, and her ladyship that will give me the tobacco.'

While dealing with the Emerald Isle, we may be allowed to quote several other equally witty and amusing replies, such as could only proceed from a warm-hearted son of Erin. It is said that when Sir Richard Steele was asked how it happened that his countrymen made so many bulls, he replied: 'It is the effect of the climate, sir: if an Englishman were born in Ireland, he would make as many.' He was therefore—perhaps intentionally—guilty of making a bull while seeking to explain their origin.

An American and an Irishman were once riding together, and coming across an old gallows by the wayside, Jonathan thought he would have a quiet laugh at Paddy's expense. 'You see *that*, I calculate,' said he, pointing to the gallows. 'Now, where would *you* be if the gallows had its due?' Paddy replied: 'Riding alone.'

Another Irishman was observed writing a letter in a very large hand, and when questioned as to why he employed such large characters, replied: 'Arrah, dear, an' isn't it to my poor mother I'm writing? An' she is so very deaf that I'm writing her a loud letter.'

'Come down this instant!' said the boatswain to a mischievous son of Erin who had been idling in the round-top. 'Come down, I say, and I'll give you a good dozen!'—'Troth, sir, and I wouldn't come down if you'd give me two dozen.'—Another seafaring Irishman was engaged hauling a rope into a small boat, when the captain of the ship, who was on the poop, ordered him to 'bear a hand.' The captain then took a turn on deck, but on his return Barney was still working hard at the line. 'Why, haven't you reached the end yet?' cried the captain.—'No, indeed, master; and, by my soul, I've been looking for the end till I am beginning to think it has got none. I do believe, sir, somebody has cut it off!'

Footo, on his return from a visit to Ireland, was asked if he had seen Cork. 'No,' he replied; 'but when I was in Dublin, I saw a great many *drawings* of it.'—Pope, notwithstanding his diminutive and misshapen figure, is said to have been not a little susceptible of even personal vanity. One day he asked Swift what people thought of him in Ireland. 'Why,' said Swift, 'they think that you are a very little man, but a very great poet.' Pope instantly

retorted: 'And in England they think of you exactly the reverse.'

During the performance of one of Dryden's plays, an actress gave the line,

'My wound is great because it is so small,'

in as moving and affecting a tone as she could, and then paused, looking very distressed. The Duke of Buckingham (Villiers), who was in one of the boxes, rose immediately from his seat and added in a loud ridiculing tone of voice:

'Then 'twould be greater, were it none at all.'

This had such an effect upon the audience that they hissed the actress from the stage.

Prince Albert used to relate how, while at Osborne, he was in the habit of getting up early and walking about his farm. One morning, when passing a farmer's house, he stopped to make some inquiries, knocked at the door, and asked the man-servant if his master was in. The servant replied: 'He is in, sir, but not down-stairs.'—'Oh, very well,' was the Prince's reply; and he was about to leave.—'Would you be kind enough to leave your name, sir?' said the servant.—'Oh, it does not matter,' said the Prince.—'Because,' continued the servant, 'my master would be angry with me if I did not tell him who called.'—'Very well,' said his Royal Highness; 'you may say Prince Albert.' Upon which the man drew back, looked up significantly, put his thumb to the tip of his nose, extended his fingers, and exclaimed, 'Walker!'

FOR THE LAST TIME.

WITHIN this room she passes her still days!

I pause upon the threshold, while my eyes

Gaze wistfully around, for memories

Of her sweet face, her thoughts, her words and ways,

Shall make the sunshine that through life's dark maze

May gild the pathway with its golden dyes;

And when I walk far off 'neath alien skies

My heart shall still be gladdened by its rays.

For the last time I look around. I hear

No sound save pattering ivy 'gainst the pane.

Ah! how my heart grows chilled with sudden fear

Lest this last hope that I have held be vain—

Lest I should never see your fair face, dear,

Or clasp once more your hand in mine again!

But no; I hear your footstep at the door.

Love, you can meet me thus with smiling face,

While I—I do but long for breathing space

To give these cold stiff lips the power once more

To greet you calmly, as they could before

I knew the truth. And yet, would I retrace

The path that I have trod, and leave this place

With the heart quiet and free that once I bore?

I cannot tell. Thoughts wander through my brain

Like dreams that come and go beyond our will.

You speak, I know; I answer back again;

But nought of all seems real to me, until

We come to say good-bye. Then bitter pain

Gives me sure proof I am not dreaming still!

LOVE.

LOVE is such an old, old story, and so much that is good and expressive has been written and sung about it, that we feel rather scared on approaching the subject. But it is one that will bear constant re-inspection; it can never be exhausted; it possesses the secret of perpetual youth; for it plays so important a part in the state of our existence, whether that be one of happiness or unhappiness, that our interest in it can never be abated. In all phases of our life we are subject to be affected by it in its various forms; and even if we restrict its meaning to that special form of affection which is generally understood by it, we shall find that its interest to us is perennial. In early youth, as we stand on the threshold of life, ere yet we dare to enter the lists of love ourselves, and when the sly allusion brings the hot blood with a rush of colour to our face, we still observe the feats of others with not a little curiosity. Unconsciously, we are gaining, by storing up the experiences of others, the education which is preparing us for the fatal hour when we shall have to take our stand amongst the doomed victims of Cupid.

Later on, what is life to us but a great ocean of love? No longer do we stand outside; but, happy and joyous, we bathe ourselves in its sweet and impalpable essences. It is the medium through which impressions of the external world reach our senses; and hence life is beautiful and bright to us. The reluctant youth may hang back; but at that age he cannot but have many a glimpse of the truth—of the reality of love—of that ethereal influence which pervades the whole universe, and gives to man the key to by far the greatest portion of the pleasures of life. In moments of vague, thrilling disquiet, he will feel it; as he springs up and returns the bounding tennis-ball and meets a glance from that flashing eye opposite—as he whirls round a ballroom in the undulating curves of the waltz, and at moments when the music

seems to become almost human in its pathos and expression, and he feels uncomfortably conscious of some extraordinary change in his constitution, and wonders what is the matter, and pales and trembles. And when we have finished with the juvenile part of love's warfare, we yet take pleasure in looking on at the mischievous little god tormenting the youngsters, as he once used to torment us, and chuckle and fight our own battles over again, and compare notes. Thus love is always interesting to us, not merely as far as our experiences go, but also as it affects others.

On the nature of love, there have been many wise and learned disquisitions; but the only practical solution of the question we can arrive at is, that it is an attachment, a yearning experienced by one person for another; and this yearning, strange to say, seems not to be dependent on any special characteristic of the person loved. It is a terrible force, as every one knows—one that governs the world—one that is capable of making a human being superlatively happy both in the present and in the future of this life; and on the other hand, one to which many a human being can trace his or her lifelong misery and eventual destruction.

This is a terrible consideration, and one which it is worth our while to pause and think over; for the truth is that we have no control over that force, which, when once aroused, lays us at the mercy of some one else, and makes this other person the arbiter of our fate. We cannot decide by an effort of the will that we shall love such and such a person, and not fall in love with such and such another person. If the love be unreturned, we shall probably find it easier to control our own feelings; for usually then our inborn pride rises, and makes us assume an individuality and independence which is incompatible with the state of dependence on the feelings of another which is a natural concomitant of love. But it is absurd to say that in all cases love unreturned dies. If the love be returned, then we think it highly improbable that any other considera-

tions will influence it. Thus, many a refined man has been madly in love with a woman whom he has known to possess qualities which, under other conditions, would have shocked him. But they don't influence him—he is hardly conscious of them; his love is returned, and that is all he cares for. Has not every one met with cases in which a girl falls in love with a man, and still continues loving him—supposing her love to be returned—even after she has found out that he is a villain? In fact, we may lay it down as a general rule, that love once aroused, and returned, is only in very rare cases capable of being controlled. This will not be difficult to understand, when we bear in mind that love is a single and distinct feeling, as distinct and single a feeling as either admiration or respect, and not a mixture of feelings, as many people suppose, and as the ordinary language leads one to infer. And just as respect for a person may exist without admiration, so love can exist independently of either admiration or respect. There need not even exist admiration of personal beauty, for many cases could be cited where women have fallen in love with ugly men having no acquirements of any kind.

This opens a very grave question, one of such serious importance to all of us as to be quite appalling. Yes, my dear young friend, the constitution of your nature is such that you are quite capable of falling in love with a girl who may be worthless, capable of being so carried away by this love as to marry her, and capable also of suffering for your mistake. You may simply have your life blighted, your good-nature and high spirit turned to cynicism and sour irritability, and hurried even to an untimely death. Such also may be your fate, sweet maiden, with that face yet wreathed in smiles—seemingly made for nothing but joy and happiness.

It is sad to think, and still sadder to know, that every year this holds true far too often. Are we perfectly helpless, then, in the face of nature? Does she offer us no remedy for this terrible state of things? How can we be considered responsible—how can we be made thus to suffer for what seems so entirely beyond our control? That is a question often asked, and one which, if we continue merely asking it, will never be answered for us. Nature deigns not to answer our questions; her laws and methods are continually operating, and we have not to ask, but to learn and act thereby. If in this case we set ourselves to learn by the experience of others, we shall soon come to see a rent in the cloud—to feel gradually that even in this case we have to some extent the power of guiding our fate—of, at anyrate, averting disaster.

Now, then, what is love? We have been treating this question superficially; but let us go deeper. Why do you love your wife, my friend? Is it for her beauty? There are many women more beautiful than she; you have seen them, and yet you do not love them. Is it for her talents? There are many women more talented than she; you have known them, and yet you do not love them. No, you answer, rather bewildered; you do not know why you love her—only, somehow, she fits in with you. We are now getting a little closer. She fits in with you. Now, let us see why you did not love those other women.

You can't exactly say; but, somehow, they did not seem to fit in with you; there was something dissonant in your characters. We are now closer still to the solution of the question—in fact, we seem to see it. There seems to have been some sympathy, some power of receptivity in your mind or character for another mind or character of a certain type. When you met your wife, you recognised in her physiognomy, in her gait, in her manner of talking, in fact in all her external qualities, the indications of the counterpart of your own mind. Then there was an upheaval of your being towards hers; and this made itself conscious to you through the sensation of love. You were yourself totally unable to say why you loved her; most men are little acquainted with the true springs and motives of their actions.

It certainly lies within our power to influence and change to some degree our character. And here lies the solution of the difficulty; for by so modifying our character as to make it instinctively friendly and partial to the good and virtuous and such qualities as insure our happiness, we would be preparing a receptivity for a nature which would not disappoint our expectations. But not only must we have that receptivity, but we must also possess the power to recognise such a nature in others—to avoid mistake. If we were able to read other people's characters, and were also perfectly virtuous ourselves, we should be very unlikely to make a mistake; for the reading of a person's character in such a case must be instantaneous, instinctive. Such perfection it is impossible to attain, and hence all people are liable to err; but he that understands and acts on these considerations is less likely to be mistaken.

THIS MORTAL COIL.

CHAPTER VIII.—THE ROADS DIVIDE.

ON the second morning, true to promise, the watch arrived by the early post; and Hugh took it up with pride to the Hall, to bestow it in a casual way upon poor breathless and affectionate Elsie. He took it up for a set purpose. He would show these purse-proud landed aristocrats that his cousin could sport as good a watch any day as their own daughter. The Massingers themselves had been landed aristocrats—not presumably purse-proud in their own day in dear old Devonshire; but the estates had disappeared in houses and port and riotous living two generations since; and Hugh was now proving in his own person the truth of the naïf old English adage—'When land is gone and money spent, then learning is most excellent.' Journalism is a poor sort of trade in its way, but at anyrate an able man can earn his bread and salt at it somehow. Hugh didn't grudge those twenty-five guineas: he regarded them, as he regarded his poems, in the light of a valuable long investment. They were a sort of indirect double bid for the senior Meyseys' respect and for Winifred's fervent admiration. When a man is paying attentions to a pretty girl, there's nothing on earth he desires so much as to appear in her eyes lavishly generous. A less abstruse philosopher, however, might

perhaps have bestowed his generosity direct upon Winifred *in propria persona*: Hugh, with his subtler calculation of long odds and remote chances, deemed it wiser to display it in the first instance obliquely upon Elsie. This was an acute little piece of psychological byplay. A man who can make a present like that to a poor cousin, with whom he stands upon a purely cousinly footing, must be, after all, not only generous, but a ripping good fellow into the bargain. How would he not comport himself under similar circumstances to the maiden of his choice, and to the wife of his bosom?

Elsie took the watch, when Hugh produced it, with a little cry of delight and surprise; then, looking at the initials so hastily engraved in neat Lombardic letters on the back, the tears rose to her eyes irrepressibly as she said with a gentle pressure of his hand in hers: 'I know now, Hugh, what that telegram was about the other morning. How very, very kind and good of you to think of it.—But I almost wish you hadn't given it to me. I shall never forgive myself for having said before you I should like one the same sort as Winifred's. I'm quite ashamed of your having thought I meant to hint at it.'

'Not at all,' Hugh answered, with just the faintest possible return of her gentle pressure. 'I was twisting it over in my own mind what on earth I could ever find to give you. I thought first of a copy of my last little volume; but then that's nothing—I'm only too sensible myself of its small worth. A book from an author is like spoiled peaches from a market-gardener: he gives them away only when he has a glut of them. So, when you said you'd like a watch of the same sort as Miss Meysey's, it seemed to me a perfect interposition of chance on my behalf. I knew what to get, and I got it at once. I'm only glad those London watchmaker fellows, whose respected name I've quite forgotten, had time to engrave your initials on it.'

'But, Hugh, it must have cost you such a mint of money.'

Hugh waved a deprecatory hand with airy magnificence over the broad shrubbery. 'A mere trifle,' he said, as one who could command thousands. 'It came just to the exact sum the *Contemporary* paid me for that last article of mine on "The Future of Marriage." (Which was quite true, the article in question having run to precisely twenty-five pages, at the usual honorarium of a guinea a page.) 'It took me a few hours, only, to dash it off.' (Which was scarcely so accurate, it not being usual for even the most abandoned or practised of journalists to 'dash off' articles for a leading review; and the mere physical task of writing twenty-five pages of solid letterpress being considerably greater than most men, however rapid their pens, could venture to undertake in a few hours.)

Winifred looked up at him with a timid glance. 'It's a lovely watch,' she said, taking it over with an admiring look from Elsie: 'and the inscription makes it ever so much nicer. One would prize it, of course, for that alone. But if I'd been Elsie, I'd a thousand times rather have had a volume of poems, with the author's autograph dedication, than all the watches in all England.'

'Would you?' Hugh answered with an amused smile. 'You rate the autographs of a living

versifier immensely above their market value. Even Tennyson's may be bought at a shop in the Strand, you know, for a few shillings. I feel this is indeed fame. I shall begin to grow conceited soon at this rate.—And by the way, Elsie, I've brought you a little bit of verse too. Your Laureate has not forgotten or neglected his customary duty. I shall expect a butt of sack in return for these: or may I venture to take it out instead in nectar?' They stood all three behind a group of syringa bushes. He touched her lips with his own lightly as he spoke. 'Many happy returns of the day—as a cousin,' he added, laughing.—'And now, what's your programme for the day, Elsie?'

'We want you to row us up the river to Snade, if it's not too hot, Hugh,' his pretty cousin responded, all blushes.

'Tuus, O Regina, quid optes, Explorare labor; mihi jussa capessere fas est,' Hugh quoted merrily. 'That's the best of talking to a Gorton girl, you see. You can fire off your most epigrammatic Latin quotation at her, as it rises to your lips, and she understands it. How delightful that is, now. As a rule, my Latin quotations, which are frequent and free, as Truthful James says, besides being neat and appropriate, like after-dinner speeches, fall quite flat upon the stony ground of the feminine intelligence—which last remark, I flatter myself, in the matter of mixed metaphor, would do credit to Sir Boyle Roche in his wildest flights of Hibernian eloquence. I made a lovely Latin pun at a picnic once. We had some chicken and ham sausage—a great red German sausage of the polony order, in a sort of huge boiled-lobster-coloured skin; and towards the end of lunch, somebody asked me for another slice of it. "There isn't any," said I. "It's all gone. Finis Polonia!" Nobody laughed. They didn't know that "Finis Polonia" were the last words uttered by a distinguished patriot and soldier, "when Freedom shrieked as Kosciusko fell." That comes of firing off your remarks, you see, quite above the head of your respected audience.'

'But what does that mean that you just said this minute to Elsie?' Winifred asked doubtfully.

'What! A lady in these latter days who doesn't talk Latin!' Hugh cried, with pretended rapture. 'This is too delicious! I hardly expected such good fortune. I shall have the well-known joy, then, of explaining my own feeble little joke, after all, and grimly translating my own poor quotation. It means: "Thy task it is, O Queen, to state thy will: Mine, thy behests to serve, for good or ill." Rough translation, not necessarily intended for publication, but given merely as a guarantee of good faith, as the newspapers put it. *Aeolus* makes the original remark to Juno in the first *Aeneid*, when he's just about to raise the wind—literally, not figuratively—on her behalf, against the unfortunate Trojans. He was then occupying the same post, as clerk of the weather, that is now filled jointly by the correspondent of the *New York Herald* and Mr Robert Scott of the Meteorological Office. I hope they'll send us no squalls to-day, if you and Mrs Meysey are going to come with us up the river.'

On their way to the boat, Hugh stopped a

moment at the inn to write hastily another telegram. It was to his London publisher: 'Please, kindly send a copy of *Echoes from Callimachus* by first post to my address as under.' And in five minutes more, the telegram despatched, they were all rowing up stream in a merry party toward Snade meadows. Hugh's plan of campaign was now finally decided. He had nothing to do but to carry out in detail his siege operations.

In the meadows, he had ten minutes or so alone with Winifred. 'Why, Mr Massinger,' she said with a surprised look, 'was it you, then, who wrote that lovely article, in the *Contemporary*, on "The Future of Marriage," we've all been reading?'

'I'm glad you liked it,' Hugh answered with evident pleasure; 'and I suppose it's no use now trying any longer to conceal the fact that I was indeed the culprit.'

'But there's another name to it,' Winifred murmured in reply. 'And Mamma thought it must be Mr Stone, the novelist.'

'Habitual criminals are often wrongly suspected,' Hugh answered with a languid laugh. 'I didn't put my own name to it, however, because I was afraid it was a trifle sentimental, and I hate sentiment. Indeed, to say the truth—it was a cruel trick, perhaps, but I imitated many of Stone's little mannerisms, because I wanted people to think it was really Stone himself who wrote it. But for all that, I believe it all—every word of it, I assure you, Miss Meysey.'

'It was a lovely article,' Winifred cried, enthusiastically. 'Papa read it, and was quite enchanted with it. He said it was so sensible—just what he's always thought about marriage himself, though he never could get anybody else to agree with him. And I liked it too, if you won't think it dreadfully presumptuous of a girl to say so. I thought it took such a grand, beautiful, ethereal point of view, all up in the clouds, you know, with no horrid earthy materialism or nonsense of any sort to clog and spoil it. I think it was splendid, all that you said about its being treason to the race to take account of wealth or position, or prospects or connections, or any other worldly consideration, in choosing a husband or wife for one's self—and that one ought rather to be guided by instinct alone, because instinct—or love, as we call it—was the voice of nature speaking within us.—Papa said that was beautifully put. And I thought it was really true as well. I thought it was just what a great prophet would have said if he were alive to say it; and that the man who wrote it'—She paused, breathless, partly because she was quite abashed by this time at her own temerity, and partly because Hugh Massinger, wicked man! was actually smiling a covert smile through the corners of his mouth at her youthful enthusiasm.

The pause sobered him. 'Miss Meysey,' he broke in, with unwonted earnestness, and with a certain strange tinge of subdued melancholy in his tremulous voice, 'I didn't mean to laugh at you. I really believe it. I believe in my heart every single word of what I said there. I believe a man—or a woman either—ought to choose in marriage just the one other special person towards whom their own hearts inevitably

lead them. I believe it all—I believe it without reserve. Money or rank, or connection or position, should be counted as nothing. We should go simply where nature leads us; and nature will never lead us astray. For nature is merely another name for the will of Heaven made clear within us.'

Ingenuous youth blushed itself crimson. 'I believe so too,' the timid girl answered in a very low voice and with a heaving bosom.

He looked her through and through with his large dark eyes. She shrank and fluttered before his searching glance. Should he put out a velvet paw for his mouse now, or should he play with it artistically a little longer? Too much precipitancy spoils the fun. Better wait till the *Echoes from Callimachus* had arrived. They were very fetching. And then, besides—besides, he was not entirely without a conscience. A man should think neither of wealth nor position, nor prospects nor connections, in choosing himself a partner for life. His own heart led him straight towards Elsie, not towards Winifred. Could he turn his back upon it, with those words on his lips, and trample poor Elsie's tender heart under foot ruthlessly? Principle demanded it; but he had not the strength of mind to follow principle at that precise moment. He looked long and deep into Winifred's eyes. They were pretty blue eyes, though pale and mawkish by the side of Elsie's. Then he said with a sudden downcast, half-awkward glance—that consummate actor—'I think we ought to go back to your mother now, Miss Meysey.'

Winifred sighed. Not yet! Not yet! But he had looked at her hard! he had fluttered and trembled! He was summoning up courage. She felt sure of that. He didn't venture as yet to lay siege to her openly. Still, she was sure he did really like her; just a little bit, if only a little.

Next morning, as she strolled alone on the lawn, a village boy in a corduroy suit came lounging up from the inn, in rustic *insouciance*, with a small parcel dangling by a string from his little finger. She knew the boy, and called him quickly towards her. 'Dick,' she cried, 'what's that you've got there?'

The boy handed it to her with a mysterious nod. 'It's for you, miss,' he said, screwing up his face sideways into a most excruciating pantomimic expression of the profoundest secrecy. 'The gentleman at our 'ouse—'im with the black moustarche, you know—'e told me to give it you into your own 'ands, if so be as I could manage to catch you alone anyways. 'E was very pertickler about your own 'ands. An' I needn't wait: there ain't no answer.'

Winifred tore the packet open with trembling hands. It was a neat little volume, in a dainty delicate sage-green cover—*Echoes from Callimachus, and other Poems*; by Hugh Massinger, sometime Fellow of Oriol College, Oxford. She turned at once with a flutter from the title-page to the fly-leaf: A Mdlle Winifred Meysey; Hommage de l'auteur.' She only waited a moment to slip a shilling into Dick's hand, and then rushed up, all crimson with delight, into her own bedroom. Twice she pressed the flimsy little sage-green volume in an ecstasy to her lips; then she laid it hastily in the bottom of a drawer, under a careless pile of handkerchiefs and lace bodices.

She wouldn't tell even Elsie of that tardy much-prized birthday gift. No one but herself must ever know Hugh Massinger had sent her his volume of poems.

When Dick returned to the inn ten minutes later, environed in a pervading odour of peppermint, the indirect result of Winifred Meysey's shilling, Hugh called him in lazily with his quiet authoritative air to the prim little parlour, and asked him in an undertone to whom he had given the precious parcel.

'To the young lady 'erself,' Dick answered confidentially, thrusting the bull's-eye with his tongue into his pouched cheek. 'An' I give it to 'er be'ind the laylacs, too, where nobody in the world never seen us.'

'Dick,' Hugh Massinger said, in a profoundly persuaded and sententious voice, laying his hand magisterially on the boy's shoulder, 'you're a sharp lad; and if you develop your talents steadily in this direction, you may rise in time from the distinguished post of gentleman's gentleman to be a private detective or confidential agent, with an office of your own at the top of Regent Street. Dick, say nothing about this on any account to anybody; and there, my boy—there's half-a-crown for you.'

'The young lady give me a shillin' already,' Dick replied with alacrity, pocketing the coin with a broad grin. Business was brisk indeed this morning.

'The young lady was well advised,' Hugh answered grimly. 'They're cheap at the price—dirt cheap, I call it, those immortal poems—with an autograph inscription by the bard in person.—And I've done a good stroke of business myself too. The *Echoes from Callimachus* are a capital landing-net. If they don't succeed in bringing her out, all flapping, on the turf, gaffed and done for, a pretty speckled prey, why, no angler on earth that ever fished for women will get so much as a tiny rise out of her.—It's a very fair estate still, is Whitestrاند. "Paris vaut bien une messe," said Henri. I must make some little sacrifices myself if I want to conquer Whitestrاند fair and even.'

Paris vaut bien une messe, indeed. Was Whitestrاند worth sacrificing Elsie Challoner's heart for?

H. M. S. V I C T O R Y.

ROUND the memory of none of our old warships gather such hallowing associations as round those which have made the name of *Victory* a household word wherever the English tongue is spoken. Its mention calls up of their own accord in every Englishman's mind thoughts of Nelson and Trafalgar's 'crowning mercy;' but that should not be all. For its own sake, the name of *Victory* ought to have a hardly less weighty claim on our affectionate regard. Few of our battle-ships of renown, if any, can boast a name of such distinguished ancestry.

The *Navy List* gives as the distinguished services of ships named *Victory*, four of our proudest sea triumphs: 'Defeat of the Spanish Armada (flagship of Sir J. Hawkins), 1588. (Flag) *Victory* over the French off La Hogue

(1692). Jervis's victory over the Spanish off Cape St Vincent (1797). (Flag) Trafalgar (1805).' This is indeed a noble record, yet it is incomplete. 'The names of battles,' allowed as distinctions by the Admiralty, 'are those only of acknowledged victories, and where either the opposing forces have been equal or the enemy has been the stronger.' Such is the wording of the recent royal warrant authorising the Navy to record the war-service of each ship after the vessel's name in the *List*, just as the war-services of each regiment have always been recorded after its title in the *Army List*. But the official record of the battle-honours awarded to successive ships named *Victory* omits all mention of several important engagements in which they took a prominent part. Under Blake, Monk, Keppel, Howe, Hood, St Vincent, the *Victory* did the state right good service.

There have been five *Victories* in all in the service since 1570, when the first of the name was launched. As each, from old age, or whatever cause, was struck out of the list of the navy, a new one as speedily as possible seems to have been built, keeping unbroken the continuity of the series.

The first *Victory* is described in the *Archæologia* as being a vessel of eight hundred tons, with a complement of four hundred men—two hundred and sixty-eight seamen, one hundred soldiers, and thirty-two gunners—and armed with fifty-two guns. These last, before the ship disappears from the active list in 1624, were increased to sixty—the number carried by a first-rate of the period—and consisted for the most part of culverins (eighteen-pounders) and demi-culverins (nine-pounders), as broadside guns; with a few heavier pieces, set down as 'cannon-petro,' firing a stone shot of sixty-three pounds-weight, for long-range practice. As a 'shipp-royall of ye Queene's Navie,' and the third largest in the service, the *Victory*, in 1588, bore the flag of Rear-admiral John Hawkins in the fleet which defeated the Spanish Armada. For the distinguished share that his vessel took during the first four days of the running-fight up the Channel, Hawkins—while the fleet was still in the presence of the enemy, off the Sussex coast—received, along with Frobisher, the special honour of knighthood at the hand of the Lord High Admiral himself. Elizabeth, too, afterwards warmly commended the gallant services of the *Victory* during that fateful July week.

As to the subsequent history of this vessel, not much information can be gleaned anywhere. Contemporary documents record its name as the flagship in an abortive expedition to the Azores and coast of Spain in 1589, under the Earl of Cumberland, which resulted in the capture of a number of treasure-laden galleons and spice-ships from Manila. But sickness broke out on board, and the expedition had to return with less than half its numbers. The *Victory* seems to have been put out of commission after this and laid up in ordinary; for there is no mention of the vessel's name in any extant list of ships which took part in the numerous expeditions against the Spaniards under Drake, Essex, and Raleigh, between 1590 and 1603, though it is to be

found in the *Navy List* down to as late as 1624.

Phineas Pett, the great master-shipwright under James I. and his successor, in his manuscript autobiography records the launch at Woolwich, April 21, 1631, of the second *Victory*, a second-rate of five hundred and sixty tons, mounting fifty-two guns, and carrying two hundred and sixty men. This ship gained great distinction in Blake's various actions with the Dutch, notably in the indecisive engagement off Dover Roads, in November 1652, when with only thirty-seven sail he gave battle to Tromp's huge fleet of eighty. To the *Victory* in this fight is mainly due the credit of rescuing the admiral, whose flagship would have been overpowered by a number of the enemy's ships of heavier metal, had not the *Victory*, together with a sister vessel, the *Vanguard*, borne down and made the Dutchman sheer off. Again, in the next year the *Victory* bore a prominent share in Monk's great triumph off Camperdown, when the heroic Tromp met his death. So severely knocked about in these fights, however, had the brave little warship been, that its place in line of battle knew it no more. Though for thirty-six years the *Victory's* name still figures in the *Navy List*, the ship does not seem to have again been employed in active service. It is mentioned in the 'List of His Majesties Navie Royall' drawn up in 1660 at the instance of Pepys, on his entering on his duties at the Admiralty, as seaworthy; and again in 1668 in Pepys's own *Memoirs relating to the State of the Navy*, as in bad repair and laid up in harbour.

H.M.S. *Victory* the third—one of the finest hundred-gun first-rates of the time—seems to have been one of the new ships built by order of King William, about the year 1690. Its one recorded service is the battle off Cape La Hogue, May 19, 1692, as flagship to Admiral of the Blue, Sir John Ashly, commanding the lee squadron. From 1693, when the vessel would appear to have gone to sea for the last time, down to 1734, in the reign of George II., the *Victory* was kept laid up in ordinary, a poor old hulk, finally to be handed over to the breaker-up.

It is curious that from 1692 down to 1744, no mention is made in existing lists of the employment in the various naval expeditions of any of our first-rates. Not a single name of any vessel larger than a ninety-gun ship appears on the active list, though the *Britannia*, *Royal William*, *London*, *St Andrew*, *Royal Sovereign*, all of which fought at La Hogue with the *Victory*, one-hundred-gun first-rates, were new ships.

Of the fourth *Victory*, carrying one hundred and ten guns, little more is known than the story of the vessel's mysterious and tragic fate. Launched at Portsmouth in 1737, it was considered, during its brief seven years' existence, the premier flagship of the royal navy and the finest first-rate afloat. To judge by the splendid model of the vessel in the naval museum at Greenwich Hospital, this encomium was fully deserved, and is in no degree an exaggeration. The ship was the largest hitherto built, of nineteen hundred and twenty tons, one hundred and seventy-five feet in length of keel, and fifty and a half feet in breadth, by twenty feet deep. Under the flag of Admiral Sir John Balchen, a veteran of dis-

tinguished career, the *Victory*, with a fleet of thirteen other sail of the line, had been despatched, in September 1744, to raise the blockade of a flotilla of storeships for Gibraltar, which a powerful French squadron had shut up in the Tagus. After successfully performing his mission, and escorting the storeships into the Mediterranean, Balchen was on his way home, when, on October 3d, a terrific storm in the Channel scattered his ships. Some were dismasted, and others had to heave their guns overboard, but eventually all reached port in safety—except one. The flagship, with the venerable admiral (aged seventy-five), on board, and a crew of one thousand, including a number of midshipmen of the best families in England, was never heard of again. The *Victory* is supposed to have struck on the Gaskets, off Alderney; for during the night of the 3d, heavy distress-guns were heard in that direction by the islanders, who, however, owing to the violence of the storm, were powerless to render aid.

The fifth *Victory*, the last of the series, Nelson's immortal flagship, was laid down at Chatham in 1759, from designs by Sir Thomas Slade, and launched on May 17, 1765. Its dimensions were two thousand one hundred and sixty-four tons, one hundred and eighty-six feet length of keel, and fifty-two and a half feet of breadth by twenty-one and a half of depth; giving the *Victory* once more the distinction of being the largest and finest ship of war yet constructed. One point worthy of note in connection with the *Victory* is, that while the ship turned out to be perhaps the most perfect and smartest line-of-battle man-of-war England ever possessed, try as they might, our naval constructors never could manage to build another exactly similar or of equal efficiency. The great success which the *Victory* proved—as evidenced by her sobriquet of 'the smartest three-decker afloat'—is made still more remarkable when one considers the low ebb at which the art of naval construction was between 1740 and 1790. Our home-built vessels were surpassed, both for speed and manœuvring capabilities, by the ships of Spain and France during this period. Indeed, the best ships in the British service were either captured vessels, recommissioned under our flag, or else vessels built with slavish exactness on the lines of these. On the other hand, our own ships, when taken, were invariably rated in the enemy's service in a lower grade than they originally occupied.

The active career of the present *Victory* dates its beginning from 1778, when the *Victory* flew Admiral Keppel's flag in his encounter with the French fleet under the Comte D'Orvilliers, off Ushant. The odds were thirty-eight sail of the line on the French side against thirty on the British; yet D'Orvilliers shrunk from engaging. It was only when Keppel had at last gained the weather-gage, that the Frenchman could be brought to show fight. During the three hours' broadside-to-broadside fighting that ensued, until, under cover of the fast-closing-in night, D'Orvilliers slunk back into Brest, the *Victory* was in the thick of the fray, receiving very serious damage. Next, in 1782, the ship figures as flagship to Lord Howe—in the place of the ill-fated *Royal George*, which capsized at Spithead while fitting out for this very service—when he relieved

Gibraltar, and finally raised the long three years' siege. Ten years later, on the outbreak, in 1793, of the war with the French revolutionary government, the *Victory* was once more in commission with the Mediterranean fleet, and took part in the operations at Toulon as Lord Hood's flagship. From Toulon the British fleet proceeded to the reduction of the island of Corsica; and while cruising in these waters, the flagship, by a strange coincidence, had the narrowest escape of suffering the fate of Admiral Balchen's hapless *Victory* in a storm of unusual violence. But the stout-timbered old vessel managed to weather the tempest in safety, and rejoined her consorts off Ajaccio.

It was in this expedition that Nelson, as captain of the *Agamemnon*, sixty-four, first made the official acquaintance of the *Victory*. At Trafalgar, eleven years later, the *Agamemnon* was again serving in his command, joining the fleet, to Nelson's expressed satisfaction, just before the battle. Lord Howe's victory off Ushant on 'the glorious 1st of June' was fought by the Channel fleet. On Sir John Jervis taking over command of the Mediterranean fleet, he hoisted his flag in the *Victory*, destined to win more laurels in the great battle off Cape St Vincent in 1797. Nelson's triumph off the Nile was gained with a squadron of thirteen seventy-fours, detached 'on particular service' from the main Mediterranean fleet, which was lying at the time in the Tagus. So the glories of the 1st of August 1798 do not add another leaf to the *Victory's* chaplet. Indeed, this was the most unhappy period of the brave old battle-ship's career. From 1798 to 1801 the *Victory* was temporarily struck out of the *Navy List*, being employed as a convict hospital hulk, until the attention of the Admiralty was drawn to the fate of so favourite a ship.

We now come to the most illustrious portion of the *Victory's* long career. After being laid up at Portsmouth for some months after the truce of Amiens, the outbreak of hostilities in 1803 once again saw the *Victory* in commission, as flagship on the Mediterranean station. The command of the fleet was given to Nelson, with special instructions to watch the Toulon fleet. Throughout 1804 he kept cruising on and off the port, trying to induce the French admiral, Latouche-Treville, to come out and try the chances of battle; but all to no purpose, until Villeneuve had taken over the Toulon fleet, with positive instructions from Napoleon to put to sea at the first opportunity. In January 1805, taking advantage of a storm that drove the British fleet off the station, he contrived to do so; but Nelson was speedily on his track. Eastward he steered, on the lookout for the French, and then back to Gibraltar—but no Villeneuve was sighted. All through the cruise, every ship was kept prepared night and day for instant battle, ready to beat to quarters at any moment. One episode of the hunt after the French was the passage through the Strait of Messina, 'between Scylla and Charybdis,' by the whole British fleet, led by the *Victory*—'a feat unprecedented in naval history.' Nelson's justification to the Admiralty at home of the perilous exploit was that, 'although the danger from the rapidity of the current was great, yet the object was equally great.' From the Mediterranean, Nelson followed the French

to the West Indies, and then back to Europe. Twice during the long chase, the hostile fleets were on the point of anticipating Trafalgar: once in February, in the Mediterranean, off Sardinia, as they were about to cross each other's path, when a storm drove Villeneuve back to port for a hasty refit; the second time, in June, in the West Indies, off Port Royal, by a strange hap, exactly where Rodney had gained his glorious victory over De Grasse. Nelson was steering for this very spot, calculating that the French must pass close by there, when a report, which turned out to be false, that they had been seen somewhere else, drew him in another direction. The French all the time were in the neighbourhood of Port Royal. What the result of this last fight would have been, it is hard to guess, seeing that Nelson had only with him ten sail of the line and three frigates, against Villeneuve's eighteen sail of the line and ten frigates. That it would have gone hard with the *Victory*, for the French to a great extent identified the ship with Nelson himself, we have the hero's own evidence. 'The French,' he said, 'meant to have made a dead set at the *Victory*.'

Every one knows the story of the affecting scene on the beach at Southsea, when Nelson went on board the *Victory*, on September 14, 1805. The actual spot at which he stepped on to his barge was for long marked by a monument—the *Victory's* sheet-anchor, now a trophy on the Southsea Esplanade. But the scene on board the flagship when Nelson joined the fleet off Cadiz on the 28th of September was still more impressive and unprecedented than the departure from Portsmouth. 'The officers who came on board to welcome his return forgot his rank as commander-in-chief in the enthusiasm with which they greeted him.'

And now the 21st of October has come at last—

At the head of the line goes the *Victory*,
With Nelson on the deck,
And on his breast his orders shine
Like the stars on a shattered wreck.

Leading the weather column, the *Victory* bore down on the combined French and Spanish fleets a little before mid-day. 'The action'—Collingwood's graphic despatch to the Admiralty reads—'began at twelve o'clock by the leading ships of the columns breaking through the enemy's line, the commander-in-chief [*Victory*] about the tenth ship from the van, the second in command [Collingwood himself, in the *Royal Sovereign*] about the twelfth from the rear; the succeeding ships breaking through in all parts astern of their leaders, and engaging the enemy at the muzzles of their guns.' As the *Victory*, in an almost dead calm, slowly forged down on the semicircle in which the combined French and Spanish fleets were drawn up, the ship was the mark for a heavy concentrated fire. The *Bucentaur*, eighty, on board of which, though without hoisting his flag, was Admiral Villeneuve, led off, firing the first shot at half-a-mile range. It fell short. A second, three minutes later, struck the water close alongside; the third went over the ship; the fourth through the topsail. A pause followed, and then, as if by prearranged signal, eight ships opened broadside after broadside on the *Victory*.

At six hundred yards off, the flagship's mizzen-top was shot away, and her wheel, so that the *Victory* had to be steered by the relieving tackles, from below. But though severely damaged in her hull, and with fifty men struck down before she replied with a single shot, the *Victory* continued her advance in scornful silence. The vessel's sails were in tatters, and her foremast tottering, as she reached the enemy's line, steering to pass astern of the *Bucentaur*. On this ship the *Victory's* energies were first concentrated, a carronade loaded with a sixty-eight-pound shot and five hundred musket-balls into the *Bucentaur's* stern-sheet cabin windows leading off. Then, as the mighty three-decker swept past, the whole larboard broadside, every gun either doubly or trebly shotted, was poured into the *Bucentaur*.

Through the darkening smoke the thunder broke O'er her deck from a hundred guns.

Rendered *hors-de-combat* at once, with twenty guns dismounted and four hundred of her crew killed outright, the hapless *Bucentaur* heeled over on one side, and lay with a deep list, helpless on the water, for the greater part of the action. The *Victory's* starboard broadside was divided between the *Redoubtable*—which ship at once shut up her gunports, and henceforward only fired musketry from her tops—and Nelson's old antagonist, that 'Anak of the sea,' the *Santissima Trinidad*. How the flagship became locked to the *Redoubtable* throughout the greater part of the action, and the story of Nelson's death, there is no need to repeat here.

The *Victory* bore the hero's remains to England; and at the earliest moment afterwards that the exigencies of the service permitted, in 1812, was withdrawn finally from the active list, and placed in thorough repair, to be preserved at Portsmouth as a memento of England's great sea-captain and his greatest triumph.

HELEN'S ESCAPE.

CHAPTER II.

FROM Paris besieged and terrorised, to quiet, pleasant Kensham was a change I duly appreciated. We led a very tranquil life—that is, my wife, my daughter Helen, and myself; for our neighbourhood, although within easy distance of London, had not yet given a sign of expanding into a fashionable suburb; we knew everybody, and very little served to excite and amuse us.

Five years passed since my life in the Rue de Douai; and Helen, at that time a bread-and-butter miss of awkward appearance, had blossomed into a pretty girl of eighteen. We had many friends about; but we were most intimate, Helen especially, with a gentleman named Corner, an Australian of great wealth, who lived with an aunt in an old-fashioned house not far from ours. When I say that John Corner was a fine-looking, black-bearded man, who stood six feet high, was an excellent athlete and a more than average scholar, I describe a man after whom many a fair Surrey lass sighed in vain, and whom I regarded as a very good husband in prospect for my Helen. I would not know if any form of betrothal had passed between them, but they were constantly billing

and cooing, and I was very satisfied with the arrangement, for, although I did not deem wealth a *sine quid non* for my future son-in-law, I was not a rich man, and I would not have parted with her to one who could not keep her as I should have wished. When I saw that in the ordinary course of events nothing was likely to prevent Helen from becoming Mrs Corner, I determined that by no fault of mine should she prove to be unworthy of the man she married. So, as I abominated the system of sending girls to boarding-schools, I had her taught French and music and the usual curriculum at home by the best masters and mistresses obtainable.

They were a great trouble, these various professors, the French masters especially so. If I got one who promised well, just as he was getting into good swing, something—conscription or dying relations or *mal de pays*—would call him away. Willing and able men with provincial accents abounded; but, as I was a good French scholar myself, I determined that Helen should be Parisian or nothing. Finally, Monsieur Pontneuf arrived. I got him through the French Consulate in Finsbury Circus; and I was introduced to a military-looking man, broad in the shoulder, and thin in the flank, with small hands and feet, and a pleasing, although rather melancholy face of the intellectual Gallic type. He could speak but very little English; his references were exceptionally good; and, from a certain reserve and hauteur in his manner, I guessed at once that he was an imperialist gentleman driven to poverty and exile by the irony of Fate. My wife and Helen were charmed with him, and he very soon became established in our little world on a footing of almost familiar friendship. But he never took advantage of the favourable impression he had made; and after being with us three months, he was as punctilious in the respect he paid my wife and daughter as on the day of his introduction.

There was a tone of sadness about his reserve which interested me, and I felt sure that he was a man with a history, although, of course, I never presumed to broach the topic. Considering his nationality, he had a singular aversion to gaiety and social amusement, and firmly declined my repeated invitations for him to join in such rollicking diversion as our neighbourhood offered. He spent his leisure time in wandering about, cigar in mouth and hands folded behind his back, engaged in deep thought, and very soon obtained the nickname amongst the irreverent local youth of 'Dismal Froggy.'

It may be imagined that amongst ourselves we often talked about Monsieur Pontneuf, and tried to build up from our imaginations the history or the romance which had made him so solitary and pensive in his manner. At length Helen seemed to throw some light upon the matter, for she said at dinner one evening: 'Papa, what do you think I have found out about Monsieur Pontneuf?'

Of course I could not divine what it was.

'Why,' she replied, 'that he has a sweet-heart.'

'Impossible! Monsieur Pontneuf is fifty, if he is a day, and what girl is there about here who would fall in love with a middle-aged Frenchman?'

'I'll tell you who,' replied Helen—'Gabrielle, Miss Corner's French maid. I've seen them more than once together, and the servant from the Cedars brought Monsieur a note to-day.'

The notion seemed to me rather ridiculous that our solemn professor should have won the affection of the laughing, dark-eyed Gabrielle, who was, moreover, spoken of as the flame of John Corner's coachman; but the evidence of my own eyes soon proved that there was at anyrate some foundation for Helen's assertion. Upon more than one occasion of an evening I met Monsieur Pontneuf and Gabrielle together, although, from an English point of view, their deportment did not convey the idea that they were sweethearting; indeed, Gabrielle seemed to me to hold Monsieur Pontneuf somewhat in awe, for I overheard her address him as 'Monsieur,' and her manner was very deferential.

Now, it was an invariable habit of mine on a summer evening to take a stroll out of doors with my cigar or pipe, a habit I had contracted in Paris, where one never dreams of passing a close evening shut up in a warm house. A very favourite haunt of mine on these occasions was a path running along a feeble stream which we dignified by the title of 'the river,' leading to a sequestered summer-house apparently constructed for the express convenience of lovers, who, on Saturday or Sunday nights especially, patronised it largely. On other nights I generally had it to myself, and always stopped there for a few minutes to sentimentalise over the beauty of the moonlit scene spread before me. One night I became aware that it was occupied, from the sound of voices within, and as one of the voices was that of Monsieur Pontneuf, in spite of my abhorrence of eavesdropping, I paused and listened. He was speaking in French, and I managed to catch this scrap of conversation: 'Then, I am to understand that, so far as you know, he was in Paris in the year 1871, and that, when you entered his service, he was living near Amiens?'

'Yes, sir,' replied the voice of Gabrielle.

'Mind,' said Monsieur Pontneuf, 'don't let me catch you mistaking facts, or it will go very hard with you.'

'I am telling you truly, so far as I know, as I am a good Catholic,' replied the girl.

'He left Amiens hurriedly one night?' said Monsieur.

'Yes, sir. We were at supper in the kitchen when he came in, and told me to pack up as soon as I could, for we had to catch the English mail-train at ten o'clock.'

'Did he seem flurried or confused?'

'Not particularly, sir. He was pale and spoke rapidly—that was all.'

'I suppose you never heard him allude to a Madame Arosa?'

'You mean the old lady who?—'

'Yes, yes—of course I do.'

'Never, sir.'

'Of course nobody knows that you are in the habit of meeting me? At anyrate he does not?'

'I don't think so, sir; I am very cautious.'

There was a movement of feet in the summer-house, which warned me to get out of the way, so I slid behind a clump of bushes, and presently the two appeared in the moonlight.

'Report to me all you see and hear,' said Monsieur.'

'I will, sir.'

The Frenchman slipped something which chinked like coin into her hand, and they separated, he taking the path leading to the village, she going in the opposite direction towards the Cedars. From this conversation it was quite clear to me that whatever might be their relationship to one another, Monsieur Pontneuf and Gabrielle were not lovers; and, putting circumstances together, I made up my mind that my professor, like so many others in his calling, was a political refugee, either Napoleonist or Communist; and I knew very well that the French republican government, to whom both were equally hateful, was sparing no pains or expense to find out the whereabouts and to keep itself informed of the actions of all such offenders. Evidently, he was making use of the girl Gabrielle as a spy and informer; or it might even be that he was engaged in a plot against the government. During my artist life in Paris and London, I had been brought into constant contact with this class of gentry; and I knew that we should often shudder if we knew what sort of individuals make use of our free island as an asylum and live amongst us as harmless bread-winners. However, Bonapartist or Communist, criminal or innocent, Monsieur Pontneuf performed his duty to me satisfactorily and thoroughly; and it was not for me to pry behind the scenes of his life. I found John Corner in the smoking-room when I arrived at home; but I said nothing to him about what I had overheard during my walk.

'Well,' he said, 'you know I don't want to meddle in your affairs; but I've been rather put out and puzzled lately about a matter concerning which perhaps you can enlighten me; I mean about this Monsieur Pontneuf, who gives Helen her French lessons. Do you know anything about him?'

'Nothing more than that he was accredited to me by the French Consulate in London, and that he showed me very high testimonials.—But why do you ask?'

'Well,' he replied, 'because there is something going on between him and my aunt's maid Gabrielle. She has never asked so frequently for leave to go out of an evening as she has since Monsieur Pontneuf came here.'

'Perhaps there is a little affection between them.' Even to Jack Corner, whom I loved as my own son, I did not feel justified in confiding what I had chanced to overhear in the summer-house.

'I don't think so,' said Jack, shaking his head. 'He's a middle-aged man, and she's a mere girl of eighteen. Besides, she has never spoken to my aunt about it, and servant-girls always like to confide these little matters to mistresses who take an interest in their welfare. No; I think he is what we don't suspect him to be—a plotter perhaps, or a proscribed Communist leader.'

'It doesn't much matter if he is, so long as he performs his duties.'

'No. But I don't care about our maid being mixed up in this sort of business,' said Jack; 'for not only does it distract her attention from her duties, but it might involve us in unpleasantness.'

'Well, I don't know how we can find out; and I must admit that I fail to see how we can suffer by whatever two French people choose to concoct together.'

But it suddenly struck me that Jack must have seen me near the summer-house, for he was looking curiously at me, as much as to say: 'I should like to ask you about it, but I don't like to.' However, I was resolved not to say anything unless pressed, and changed the conversation. But I noticed that Jack seemed uncomfortable during the remainder of our talk, and I was puzzled to account for it. Our conversation at length turned on the trips abroad we were severally going to make during the next week—he to Switzerland, for a clamber amongst the High Alps; I and my ladies to Paris, for the important purpose of choosing the trousseau for Helen's wedding, which was to be celebrated in the late autumn.

But I saw that his mind was uneasy about Gabrielle and Monsieur Pontneuf, for, as we were bidding each other good-night at the door, he said: 'You keep an eye on Monsieur Pontneuf, or perhaps you will be astonished one of these fine days.'

'What do you mean, Jack?'

'Why, that I believe him to be nothing less than one of these Socialist dynamitards, and that he is in the thick of a plot against our own government here at home.'

PAGANINI.

TOWARDS the close of last century, an Italian woman of Genoa had a dream, and it seemed to her, as she afterwards told her little son, as though white-winged seraphs approached her couch and predicted the advent of a child whose skill as a violinist would be so transcendent that the very spirits of earth and air would seem to acknowledge his sway. The child was Nicolo Paganini—the destined Hercules of the violin—born February 18, 1784.

Ere the poor little lad could plainly speak, his days of toil began. No sooner could he hold a violin, than his father proved himself an inexorable taskmaster; the boy was urged to intense and even dangerous application; rare precocity was stimulated by privation of food, and thus the sickly child developed into a suffering man. It was in 1793 that Paganini made his first public appearance at Genoa, and played a series of variations on the air *La Carmagnole*, which had everywhere accompanied the victorious banners of the armies of the French Republic. Up to fifteen he remained quiescent under the yoke of his avaricious and tyrannical parent; but no sooner did he find in the exercise of his wondrous talent a means of delivery from the house of bondage, than he broke wildly from all restraint, and plunged into every form of dissipation, indulging especially in gambling, a universal vice in Italy, as it was indeed throughout the whole of Europe. Pitted against past masters of the craft, Paganini's means were rapidly exhausted. Jewels, watch, rings, even his fiddle, were disposed of; and he was indebted to the kindness of a French gentleman for the loan of a favourite Guarnerius, upon which he ever afterwards played, to enable him to fulfil an engage-

ment at a concert at Leghorn. On this occasion, Paganini performed a series of most difficult studies, which he had composed in still earlier years, and his skill was rewarded with triumphant applause. 'Never again,' replied the enthusiastic Frenchman, as the young artist hastened to return the violin, 'will I profane the strings which your fingers have touched; that instrument is yours.' This was the violin which Paganini bequeathed to his native town of Genoa, where it is still shown under a glass case in the municipal palace.

In 1805 Paganini accepted the position of director of music and conductor of the orchestra in the service of the Princess Maria, afterwards Grand-duchess of Tuscany, sister of Napoleon, and wife of Bacciochi; and it was at this period of his early career that he first elaborated many of those peculiarities, such as performances upon one string, which afterwards became so characteristic of his style. At Ferrara he had a narrow escape from being lynched. It had been arranged that a certain Signora Marcolini should take part in his concert, but at the last she left him in the lurch, and a danseuse with a pretty voice was good enough to come to the rescue. Nevertheless, the disappointed public hissed and hooted her down, and Paganini resolved to be avenged. At the close of the concert, he proposed to amuse the audience by imitating on the violin the sounds of various animals. Having reproduced the mewling of a cat, the barking of a dog, the crowing of a cock, &c., he suddenly burst forth into a perfect imitation of the donkey's bray; and the musician bowed once again, as he added with his cynical smile: 'This for those who hissed before and laughed.' The result was electrical. The Ferrarese—who enjoyed a widespread reputation for stupidity—took the joke as especially personal to themselves; in a moment the pit rose to a man, charged through the orchestra, scaled the stage, and would have killed Paganini, had he not precipitately fled. One evening, at a concert in Leghorn, he came upon the stage limping from the effects of a nail which had run into his foot, and there was some tittering among the audience. Just as he was beginning to play, the candles fell out of his music desk, and once more there was an uproar. Suddenly the first string broke, and the merriment waxed yet louder; but, to use the words in which he naively told the story of himself, 'I played the piece on three strings, and the sneers quickly changed into boisterous applause.'

Early in 1828, Paganini, at the request of Prince Metternich, for the first time visited Vienna. Men and women of all classes of society went mad about him: verses were poured forth in his honour, snuff-boxes and cigar-cases displayed his portrait; gloves, rings, stockings, coats, everything in the shop-windows was à la Paganini; a good stroke at billiards was called 'un coup à la Paganini'; dishes were named after him; and an enthusiastic cabman, who drove him to his concerts, besought of him permission to paint his cab in the Italian colours and to print upon it the words, 'Cabriolet de Paganini.' These extraordinary successes, however, served only to give new currency to the tales of crime and *diablerie*, which had so often circulated in connection with him. To atone for the base assassination of a rival, it was said that he had passed years within the

walls of a dungeon with nothing but his violin to mitigate the rigours of captivity. He was a captain of banditti—a deadly duellist—in league with the Prince of Darkness. In England, some of the people who thronged his passage to and from the theatre sought to discover, by touching him, whether he were really a being of flesh and blood; and an Italian lady who followed him one evening to the stage-door, where his cab stood in readiness, hesitated not to avow that his feet never touched the ground, and that he was borne away through the air in a chariot of fire, drawn by a pair of black horses! Yet all the stories told of him were not unpleasing, for there were many who regarded him as an angelic being whose mission it was to vouchsafe to mortals some foretaste of the heavenly harmonies which will be hereafter; while others spoke of a choir of sweet-toned spirits hidden within the instrument as he played. One day, as he walked in the streets of Vienna, Paganini saw a poor boy scraping some Neapolitan airs before the windows of a great house. Instantly crossing the road, the great artist entered into conversation with him, and ascertained that he maintained a sick and widowed mother by his scanty earnings as an itinerant musician. Taking the boy's fiddle and bow, Paganini commenced to play. A crowd rapidly collected; and when he concluded the performance, he handed round the hat, and made a collection, which he presented to the young Italian, amid the cheers of all assembled, remarking as he did so: 'I hope I've done a good turn to that little animal.'

The singular personality of Paganini was displayed no less conspicuously in private than in artistic life. His existence alternated between excitement and exhaustion. He would sit sometimes for hours wrapped in moody silence, and at other times surrender himself to the wildest effervescence of gaiety. Full of contradictions, he was especially talkative when travelling; and though, latterly, the delicacy of his lungs affected his voice, he loved to talk loud and fast when the rattle of the wheels over the pavement was most deafening. He journeyed with the utmost speed from place to place, and to the charms of scenery or the strange sights of foreign towns was equally insensible. In the hottest weather, he would wrap a furred pelisse round him, and huddle himself up in a corner of the carriage, with every window closed. Arrived at his hotel, he would have all the windows open, and called it taking an air-bath. But he never ceased to anathematise the climates of Germany and France, and declared that Italy was the only country fit to live in. Soup or a cup of chocolate was all that he took before commencing a day's journey; and at night, a light supper, or oftentimes a cup of chamomile tea, was sufficient for his needs. The conqueror of Scinde himself had no greater contempt for a superfluity of baggage than Paganini. A coat, a few changes of linen, and a hatbox—a carpet-bag and a shabby trunk, wherein travelled his beloved Guarnerius, his jewels, and his money—constituted the whole of his impedimenta. His papers and accounts were thrust into a small red pocket-book in most admired disorder. He was all but ignorant of arithmetic; and his business calculations, though sufficiently accurate, were effected by methods purely original. Of general

knowledge, in fact, he had little or none; books to him were a *terra incognita*, and political events devoid of interest. To himself, he was the only important fact everywhere, and the newspapers he read merely for the sake of what might personally concern him. In his own quarters, Paganini maintained the strictest solitude, and lounged on the sofa the greater part of the day. Save at concerts, and occasionally at rehearsals, his violin was never touched; he had worked enough, he would say, and the season for repose was come.

Through the events of his German campaign, where Prague, Dresden, Berlin, and Warsaw were in succession visited, we may not follow him, but will rejoin him at Paris, where, on the 9th of March 1831, he gave his first concert at the Opera House. Paganini was then forty-seven years old, and his appearance was likened to that of some shadow from the demon world. A lean, gaunt, haggard figure, with wan thin face, framed in long black hair straggling down over his shoulders, and with a strange scornful smile hovering ever about his lips, he shuffled forward from the side-scenery to the footlights. The impression which he created on his first appearance is described as having amounted to a 'positive and universal frenzy,' and at the close of each piece the whole audience rose *en masse* to recall him.

About the middle of May, Paganini left Paris for London, and on the 3d of June he gave his first concert at the King's Theatre. Though the indescribable enthusiasm created by his playing is said to have been somewhat damped by the extravagant prices charged for admission, Paganini's tour through London and the provinces brought him a golden harvest; and it was calculated that, on one occasion, at Winchester, his own part of the performance, for which he received the sum of two hundred pounds, occupied just twenty-eight minutes. His greatest triumph, however, was probably achieved at Lord Holland's, when he was requested to improvise upon his violin the story of a son who, after murdering his father, leapt into a bottomless abyss with the girl who had refused to listen to the story of his love. Paganini stipulated for darkness; and so weird was the musical interpretation of the story that had been proposed to him, that many of the ladies fainted; and with the return of light, the scene in the concert chamber was likened to the appearance of a battlefield cumbered with the bodies of the slain! There is reason to believe that the proceeds of his performances in England amounted to twenty-four thousand pounds.

The remainder of his story is quickly told. Broken in health, and having acquired a large fortune by the exercise of his art, he bought, among other property in his native Italy, a charming country-seat near Parma, where, though he occasionally played at concerts chiefly for the benefit of the poor, he spent two or three years in comparative retirement. In 1836, however, he was induced to lend his name to the establishment of a gambling-room and concert-hall in Paris, called the Casino Paganini. The undertaking unfortunately proved a failure; and the fatigue of the journey which, in consequence of law proceedings, he was compelled to make to Paris, without doubt hastened his end. Fearing the effect of a northern winter, his medical

advisers recommended him to return to the south; and after a painful journey through France, he at length arrived at Nice, where, on the night of the 27th of May 1840, he quietly passed away. The last evening of his life, he would have no light in the room; but on suddenly awaking out of a peaceful sleep, he drew aside the curtains of his bed and gazed forth into the unclouded glory of an Italian night. His window was open, and the whispering of the breeze among the trees seemed to rouse within him the longing to render back again to nature somewhat of the sweet sensations she was bestowing upon him in that final hour. Yet, though the moon had risen, and was pouring a flood of radiance across the bed, to him everything seemed in shadow, for his eyes were dim. He extended his hand and grasped the beloved violin—the faithful friend which had so often been the soother of his troubles—and strove to bring some sound out of the instrument. But the magic power had for ever quitted his fingers, and falling back upon his pillow, he expired.

He left eighty thousand pounds, together with the title of Baron (conferred upon him in Germany), to his only son, Achille Paganini, the offspring of his union with Antonia Bianchi, a singer with whom he had long since quarrelled. Life for Paganini had indeed been a 'fitful fever,' and it seemed as though even his remains were not to be permitted to 'sleep well.' He died, it seems, unshriven and unfortified by the last sacraments of his Church; and he was, in consequence, refused burial in consecrated ground by the Bishop of Nice. The body was therefore transferred by sea from the lazaretto of Villa Franca to a country-seat in the neighbourhood of Genoa. Finally, owing to the strange and ghostly sounds—wailings of the unsatisfied spirit of the great musician—which it was affirmed were heard by night proceeding from the coffin, his friends obtained permission to inter the corpse near the village church adjoining his favourite residence, the Villa Gajona. It was not, however, until five years after his death, and then without any display, in conformity with the orders of government, that this tardy tribute was rendered to the remains of the immortal Paganini.

PARSON VENABLES' ADVENTURE.

IN TWO CHAPTERS.—CHAP. II.

MR and Mrs Venables drove on for a little way in silence. It was growing cold, and a thick rime appeared on the vicar's beard and hair and on his wife's shawl. Doubtless, Charles's tail and mane were completely silvered with it; but for some time past the pony had been hidden from the sight of the driver.

'If that was the great quoit, we should be near the cross-roads,' said the vicar.—'Hark! what is that noise?'

They both listened intently, and distinguished a man's voice, calling, as it seemed, to some animals. Judging by the loudness of the sound, it was not distant from them.

'It is probably Collins driving home his goats,' said the vicar. 'I wish we could make him hear us. Hardly any weather baffles him; the downs

are so familiar to these men who have been bred on them.—Halloa! Collins—hilliho!'

He shouted at the full power of his voice, and waited for an answer. An indistinct halloo came in reply, mingled with the barking of a dog; but the sound was evidently more distant than before, and in a moment it ceased altogether.

Mrs Venables began to whimper. 'I didn't think Collins would have left us like this!' she sobbed. 'Cruel man! he may find us dead in the morning.'

'Pooh, pooh!' said the vicar cheerfully; 'we shall be all right presently.—Here we are at the cross-roads, I declare. Now, we have only to turn up here and we shall be at home presently. Put your other shawl about you, my dear.—There! Now you are quite comfortable again.'

But, oddly enough, Charles declined to turn up the cross-road. He resisted stoutly every effort which his master made on the reins; and at last, by a strong tug of his muscular neck, he actually got his head round in the opposite direction, and trotted away at a sharp pace towards the quarter whence they had come.

'He's running away!' screamed the old lady. 'Hold him in! Pull him up!'

'What the mischief is he up to now?' exclaimed the vicar. 'I can't pull him up, my dear; his muscles are far stronger than mine.'

They were indeed; the bull-necked little beast had the power of ten ponies in his chest and loins, when he chose to put it forth; and a much stronger man than the vicar would scarcely have succeeded in holding him in, when his mind was bent so obstinately on running away as it was at this moment. He rattled along at a great pace; never had he been known to go so fast; stone hedges and granite quoits would doubtless have appeared to fly behind, had it been possible to see them.

'It is useless,' said the vicar, laying down the reins in calm despair. 'I have no power over him. After all, animals are often much wiser than men; he may know better than we where he is going.'

Mrs Venables cowered closely to her husband's arm. 'I am afraid he will run up against something,' she said, in a timid whisper.

'I don't think he will,' rejoined the vicar; 'he is a sensible beast on the whole.'

It was not long before Charles came to a dead stop, so suddenly as to shake his master and mistress violently in their seats.

'Where are we now?' inquired the vicar, petulantly. 'Get on, you brute!' And he flicked Charles sharply with his whip. But Charles refused to stir: he stood like a solid rock, and neither threats nor entreaties had the smallest effect on him. The whip was equally ineffective; and the vicar turned towards his wife with a mournful shrug of the shoulders.

'He knows he is in some dangerous place, Theophilus,' said the old lady. 'Oh, I am so terrified! I daresay he is standing on the brink of an old mine-shaft. Don't beat him any more; he may throw us down some awful pit.'

'There's no knowing where he may have brought us, certainly,' the vicar admitted; and with that relapsed into silence.

Presently, Charles began to give signs of a most uncomfortable restlessness. He stamped impatiently on the ground, whinnied loudly, and jerked himself more than once in the shafts in such a way as to suggest very disagreeable possibilities in the event of his being really on the brink of some precipice.

'I don't like this,' said Mr Venables. 'I think I must unharness him; he will do some mischief, break the shafts, or upset us, perhaps.'

'Do be careful!' entreated his wife, seeing him preparing to dismount. 'I wish you would not get out.'

'Of course I shall be careful.' The answer came in an irritable tone, for the vicar's temper was beginning to give way under these accumulated trials. His fingers were chilled, and the straps and buckles slippery with the rime; but he succeeded at last in freeing Charles, who gave a snort of relief, and instantly trotted away without, apparently, the smallest thought for the safety of his companions in misfortune.

'Oh, he's gone!' exclaimed Mrs Venables, whom this desertion by their dumb companion seemed to strike with additional dismay. 'What on earth shall we do?'

'We had better shout, I suppose,' said her husband, getting into his seat again; 'there's a possibility, of course, that some one may hear us.'

They shouted together; the old lady's thin piping contrasted oddly with her husband's stentorian bellows. There was no reply, save that when the noise of their voices ceased, there appeared to be a mournful murmuring in the air, but that was probably imagination. They waited a few minutes and then called again more loudly; and this time there was an extraordinary answer. A loud rattling rending sound broke the stillness, there was a sudden crash, and a sound of voices: a light flashed; something hard and metallic was flung to the ground at no great distance from them; and then, with a scuttering of feet, everything died away into silence again.

Mrs Venables was too much frightened to speak; she clung closely to her husband's arm; and he himself was too much disconcerted for a moment to venture on speech.

'As to what that may have been, I can't venture a guess,' he said. 'It seems likely that we shall be here for some time, however. You had better put on all the wraps we can find.'

He rummaged about under the seat, and found a heavy carriage rug, which, when drawn up over them, promised to protect them very fairly from the cold.

'Come, it might be worse,' said the parson. 'I don't remember spending a night out of doors before: it will be a new experience.—Are you warm, my dear?'

Mrs Venables was very warm; in fact, she was clothed in so many shawls that nothing short of Arctic frost could have reached her. She was in fact comfortable enough; and as everything around was now profoundly quiet, she soon began to yield to the drowsiness induced by the excitement of the last hour. The parson made her as comfortable as he could, and sat thoughtfully considering their position. Reflection brought out no new facts. Nor did it offer any better solution of the existing difficulty, than that they

should sit still until something happened—for instance, until the day broke; though the unpleasant thought suggested itself that even then, unless the fog had lifted, their position would not be improved.

The situation was disagreeable enough; but the parson, who was not devoid of philosophy, was beginning to nod over it, while Mrs Venables was snoring loudly, when a step was heard by the side of the wheel, a light was flashed into the vicar's eyes, and a rough voice exclaimed: 'Why, master, what be 'ee sitting here for?'

'It's Hugh!' cried Mrs Venables, joyfully awaking in an instant from her slumber. 'O dear Hugh! how did you find us?'

'Ay, Hugh, where are we?' the vicar broke in. 'Did you come out to look for us? What a good fellow you are! Are you sure you know the way back?'

'Way back!' repeated Hugh contemptuously. 'Back where?'

'Where? Why, home!—to the vicarage, to be sure! Where else could we want to go at this time of night?'

'And where do 'ee think you be, then?' asked Hugh, still more contemptuously than before.

'Now do, like a good fellow, ask no more questions,' said the vicar, getting down from his seat; 'but show us the way back, unless it is too far to walk.'

'Well, I never knew the like of this!' said Hugh; and with that he laid his hand on his master's shoulder and guided him a few paces in advance of where the shafts of the pony-carriage touched the ground. 'There!' he said gruffly, 'what be that?'

'That's a wall, it seems,' said the vicar, considerably mystified.

'Ay,' said the man; 'and what be that?'

'A gate, as I live!' shouted the vicar—'my own gate, the vicarage gate.—Anna, we are at home!'

'Do you mean to tell me, Theophilus,' said the old lady in a tremulous voice, 'that I have been sitting screaming myself hoarse, and catching my death of cold at my own gate all the time?'

'I am afraid you have, my dear.—Ho, ho! what a joke this is!—You mustn't tell Hartle, Anna.—Let me help you out.'

'I can get out very well by myself,' said Mrs Venables testily; 'and as for helping me, you might have thought of that an hour ago, and saved me from this ridiculous position.'

'My dear,' said the vicar, rather dismayed at the suddenness of this attack, 'I did all I could.'

'Oh, I don't know,' his wife answered impatiently. 'We shall be the laughing-stock of the neighbourhood.—And what has become of Charles, I should like to know?'

'Yes, Hugh, what has become of Charles?' repeated the vicar, relieved to have the opportunity of changing the subject.

'In the paddock,' replied Hugh. 'Came in forty-five minutes ago—so the boy says; and he'd have told me at once, if he hadn't had a fool's head atop of his shoulders.'

'So! No wonder the poor beast was restive!' commented the parson. 'I shouldn't have sat so quietly myself, if I had known my supper was within fifty yards of me.'

As they stood on the doorstep waiting for an

answer to their summons, Mrs Venables whispered to her husband: 'We needn't tell Belinda.' The parson nodded, and at that moment the door was opened by a trim maidservant, and Miss Belinda came running out into the hall.

'Oh, Uncle Theophilus!' she cried—'oh, Aunt Anna, I have been so frightened!'

'Frightened, you silly child—what at?' asked Mrs Venables.

'There were such horrid shrieks at the garden gate,' said Miss Belinda; 'you never heard such howls and bellowings.'

'Some one of the farmers going home from the inn,' said the parson. 'What is there so terrible in that?'

'O no!' said his niece. 'They were not human voices—they were much too harsh; they were like the screaming of fiends.'

The vicar looked at his wife as if to satisfy himself what she thought of this plain speaking about her vocal powers.

'Stuff and nonsense, Belinda!' said the old lady angrily. 'I can't listen to such trash. How could there have been any fiends at the gate of the vicarage?'

'Oh, but there were,' Miss Belinda persisted; 'for Jane said she would go out and see what it was, though I advised her not; and she went as far as the gate with a lantern; and there she saw a hearse with plumes on it, and she was so frightened that she dropped the lantern and ran back, and we barred the door and bolted it.'

'Now, don't let us have any more of this,' said the vicar decisively. 'Your head is too full of these things, Belinda; and Jane is as foolish as you are. Let us have our supper, and pray, oblige me by forgetting this nonsense.'

And the truth about Parson Venables' adventure is now for the first time made generally known.

THE FADING OF PHOTOGRAPHS.

THE family album upon the drawing-room table is a never-failing subject of interest to visitors, and among individuals who lack original ideas, forms an agreeable subject of conversation in place of that of the weather. Of late years, however, there is more diffidence in placing it in prominent positions for the ready examination of waiting friends, the sad-coloured pictures of 'the hue of a November fog in Cheapside, or a bad piece of gingerbread spoilt in the baking,' being at variance with average ideas of artistic elegance. A more serious aspect of the case is the gradual discoloration or fading of the likenesses of members of the family who have passed away by death, raising the question in the minds of survivors what is to be done to preserve those lineaments for future inspection ere it be too late.

When the white parts of an ordinary photograph begin to turn yellow, that photograph is doomed unless immediate efforts be made to preserve it, and those efforts may not always be successful. Treatment with a weak solution of bichloride of mercury, under the hands of a skilful photographic practitioner, is one of the best methods of making the attempt; this may arrest decay, but will not restore the likeness to the condition of a first-rate photograph. Bichloride of mercury, or corrosive sublimate, is highly

poisonous, and is best left alone by the uninitiated. A better way of preserving the memento is to send the photograph to a platinum-printing or carbon-printing firm of photographers, in a sufficiently large way of business to keep upon their premises artists skilled in the use of the brush and pencil. Their usual plan, then, is to obtain upon glass or paper an enlarged positive copy of the fading photograph: this copy is 'retouched,' that is to say, worked upon by hand so as to remove obvious defects due to decay or to original bad work; a negative is taken from the perfected positive, and from this negative any number of copies may be printed by photographic means in permanent carbon pigments or in platinum black. To obtain the positive already mentioned, a primary negative has to be taken, so that two negatives are necessitated by the process, both of which, as well as the positive, are usually worked upon somewhat by the hand of the artist; the method of getting a good permanent photograph from a bad fading one is therefore complicated, and requires skill.

In the carbon process, carbon or other suitable permanent pigment is spread upon paper or glass along with solution of gelatine and of bichromate of potash or ammonia: where the light acts upon this surface through the negative, the decomposition of the salt renders the gelatine insoluble; consequently, when the paper is afterwards placed in warm water, the gelatine unacted upon by light dissolves off in company with its pigment, thus leaving the white paper exposed; but where the light has acted, the gelatine and pigment remain to form the shadows of the picture. These are the broad principles of the process, omitting various practical details which it would exceed present limits to particularise. The other permanent process, in which the dark parts of the picture are formed of platinum black, gives the most durable pictures known, platinum being a metal which has more power than gold of resisting change under atmospheric and other influences; indeed, platinum black is infinitely more permanent than the paper upon which it is printed. In some cases, either from badly prepared sensitised paper, or from faults in the photographic manipulations, platinum prints have been known to turn yellow in the whites under the influence of sulphuretted hydrogen; such discoloration has sometimes been subsequently removed by the application of chemical reagents, without the dark parts of the picture having been affected all through the operations. There are methods of taking photographs in silver which have exactly the appearance of platinotypes, so that an expert cannot always tell the difference without the application of chemical tests; these black and engraving-like silver prints are in all probability much more permanent than the ordinary photographs used for the stocking of albums.

The best photographers know how to produce permanent photographs, if their patrons insist upon having them; but such pictures have not usually the appearance of ordinary photographs, unless the carbon process with a pigment of the requisite colour be employed. Messrs Gézuzet, Bros., of Brussels, photographers to the Queen of the Belgians, have for a long course of years issued to the public none but carbon photographs,

even of such small dimensions as *cartes de visite*. The colour of the pigment has been such that unskilled purchasers cannot tell that they are not ordinary photographs; after lapse of years such likenesses preserve their pristine beauty, whilst silver prints alongside them in the same albums fall into the sere and yellow leaf.

On turning over the leaves of any album, those photographs whose life is fairly on the wane may be at once recognised by a sickly yellow colour taking the place of the whites of the picture. To detect this change in its incipient stages, the whites of the photograph should be compared with the cardboard of the leaves of the album; both should be equally white. First-rate photographers think it their duty to turn out pictures of this class with pure whites in the highest lights; second-rate photographers commonly turn out pictures dingy in the high lights and feeble in the shadows, faults usually due to bad printing or bad negatives.

Common photographs consist of silver in a more or less reduced state upon a film of albumen coagulated by the chemicals through which it has been passed. The greatest enemies of the permanence of such prints are: (1) Traces of chemicals not fully washed out of the print by the photographer. (2) Damp. (3) The action of sulphur or its compounds. The last of these agencies of degradation is the most difficult to avoid; the albumen itself contains sulphur as an essential constituent; it is this sulphur which attacks silver egg-spoons. The air of towns contains sulphurous gases from drains, and among the products of the combustion of coals and gas. Bronze powder, used instead of gold for printing addresses upon some of the cards upon which photographs are mounted, has sometimes proved a prolific cause of local fading, the bronze dust falling upon the picture, and in course of time producing white spots thereon, when the powder contains sulphide of tin. A story is told of a young man asking a photographer not to mount his likenesses upon the ordinary trade cards of the establishment, as he did not wish his friends to see the cheap prices printed thereupon. The photographer, therefore, mounted the pictures upon the backs instead of the fronts of the cards. In due time the bronze-printing did its work, and the low price paid became visible in white letters upon the face of the photograph itself.

All the conditions governing the fading of ordinary photographs are not yet fully understood; but pictures of this class rarely remain unchanged in appearance for twenty years, and in no instance, probably, are they permanent in a historical sense; they serve but temporary purposes. At their advent, the public disliked their chocolate colour; by force of long familiarity therewith, there is now, on the other hand, a certain amount of prejudice against photographs in black and white, but this feeling is diminishing year by year, especially among the more cultured classes, so that at Photographic Exhibitions engraving-like pictures are steadily on the increase. The remedy for the fading of the family photographs rests in the hands, or rather in the heads, of the general public more than anywhere else; if the public demand permanent likenesses in platinum, or in carbon or other permanent pigment, and see that they get them, the supply

will follow the demand, and the household album will then no longer suggest by its colours a collection of leaves of trees gathered in the autumn season.

FROM THE UNDER-WORLD.

ONLY a few days ago, and the Old Priory Garden was wrapped in its snowy mantle; the trees were bare and black, or covered with hoar-frost; the earth hard and ice-bound; the half-hardy herbage crumpled up and brown, or hanging limp and dejected-looking on their shrivelled stalks; even the holly and ivy had lost their crisp glossy freshness; and the yew drooped sadly in the biting hail and cutting east wind, rendered all the more insidious by an hour or two of brilliant sunshine in the middle of the day, that would melt the frost and snow off the turf in patches, to be all the more easily a prey to the bitter wind, and rendered sapless and lifeless.

Round every corner comes this Eastern fiend, lifting up every dry leaf, and penetrating to the inmost recesses of the tender under-shoots. Nothing is safe from its fierce treachery. Here, it strikes down the hale middle-aged man with an acute attack of pleurisy; there, a happy, well-cared-for child is barely pulled through the sudden sharp touch of croup; and scores of the 'uncared-for' atoms of humanity are not pulled through, but are choked out of existence without help.

Now, an aged individual creeps out of doors into the pleasant sunlight. As long as he keeps in the shelter of the south wall, he is fairly safe; but an old acquaintance greets him, and in a fatal moment he turns the corner of the wall, perhaps stands two minutes talking. Suddenly, a slight shiver seizes him and thrills through his frame; he retreats hastily homewards. 'Too late.' And his friend passes onward with an undefined foreboding that the man is going to be ill; little thinking that, in the idle moments of friendly gossip, the east wind has chilled the lifeblood, and checked the already too languid circulation in the aged veins. Job says: 'The east wind carrieth him away, and he departeth;' and again in Hosea: 'The east wind increaseth desolation;' and over there in 'God's-acre' are newly made graves, that have been filled by the cruel ravages of this unrelenting monarch, over whose occupants might be fitly written the above epitaphs. When gentle Charles Kingsley wrote his ode to the *Bluff North-easter*, did he think the 'wind of God' would be his own death-warrant? But so it was: the disease that carried this gentle, loving soul to his grave was intensified and aggravated by the baleful effects of a sudden chill.

But at last—at last this arch-enemy has departed; and though a chill rawness is in the air, still there is a strange subtle difference to the senses. Waking up in the very earliest dawning, your ears are saluted with the musical trickling of water down the spouting, the soft fall of rain on the roof, and sudden little wet dashes against the window. The wind has a low hollow murmur

in the distant elms, and swirls round in fitful gushes, that have a gentler cadence. As you lie still and listen gladly to these welcome sounds, you are conscious of breathing easier and taking deeper respirations before dropping off into a more restful and life-giving sleep. Strangely enough, you sleep an hour later than usual. But to what a different world you wake up! After another twenty-four hours' rain, and you go out of doors in the wet glistening morning, what do you find? That a thrush is singing its sweet shrill melody from the top of an apple-tree, whose bare and apparently lifeless branches have already felt the quickening thrill of the rising sap; and looking closely, you find tiny points of vivid crimson in every twist and turn of the boughs. The brown sheaths of the pear have opened, revealing the tender white cone of the coming blossom. The hardier fruit-trees have made best use of the time, and are sprouting rapidly. You feel a puff of the south wind; and along the old wall, from the 'dark under-world,' have appeared the pale snowdrop; and in another corner, half-a-dozen golden gems of the winter aconite peep out cheerfully. The daisies have not yet dared to lift their ruffled faces; but the turf has a brighter appearance, and a sweet keen smell that is simply delicious. Whence comes this vivifying principle? From the black earth, causing all nature to shine forth at a breath of the south wind, that rives even the zone of the winter king.

He who holds the world in the hollow of His hand has seen fit for some of His children to 'go over to the majority;' but in the returning beauty and freshness and joyousness of nature we can also discern 'the tender mercy of our God, whereby the dayspring from on high hath visited us.'

A NEW MODE OF ELECTRIC WELDING.

It has long been known, says the *Times*, that the most refractory metals are fusible in the electric arc, and of late the fact has been applied to the reduction and welding of metals. In the welding process of Professor Elihu Thompson, of Boston, United States, the joint to be welded is traversed by an alternating current of electricity strong enough to fuse the metals together. But in the new process of Dr Bernardo, of St Petersburg, a continuous current from a charged accumulator is employed. The metals to be welded are connected to the negative pole of the accumulator, and a carbon pencil, such as is used in the electric arc lamp, is connected to the positive pole of the accumulator. The consequence is that when the carbon pencil is brought into contact with the joint, and then withdrawn, an arc is started between them, and the metals of the joint are fused in its intense heat until they run together. Carbon blocks are in certain cases used to retain the molten metal in its place, and a little sand is also employed as a flux. By these means boiler-plates can be mended *in situ*, blowholes in castings filled up, and iron rods jointed together. To weld two pieces of $\frac{3}{8}$ -inch boiler-plate, forty cells of the accumulator joined 'in series' and three 'in parallel' are taken to supply the current; and a 1-inch carbon pencil in a portable holder is used to strike and maintain the arc.

The power of the latter is regulated by the number of cells employed. The accumulator of Dr Bernardo has plates made of strip-lead, he having found that cells with paste in the plates do not stand the strong currents which he requires.

A DREAM-MAIDEN.

THE dawn of day is sweet and still,
And fair the light of noon,
When, wrapped in purple haze, the hill
Dreams through a golden June.

But still the hour I love the best
Comes when the sun has rolled
His glowing chariot where the West
Throws wide her gates of gold;

For then I seek the land of dreams,
And all the world to me
Falls faint and far as songs of streams
To one who hears the sea.

Where low above the river-shore
The rustling branches swing,
The lady of my dreams once more
With me is wandering.

I see her bright hair's sunny gleam,
Her lithe form's slender grace;
But even in my dearest dream,
I never see her face.

Far over all that pleasant land
Her happy voice is borne,
Sweeter than waves along the strand,
Or winds among the corn.

The sea-gull stays his flight to hear;
The brook his babble stills;
And on the mountain-side, the deer
That subtle music thrills.

Yet all the magic of her song,
Far sweeter than the birds
That sing the summer woods among,
For me has never words.

But still I follow where she goes,
Until the cruel day
Steals down the path of pearl and rose,
To bear my love away.

Time brings, I know, an hour for me
When dreaming will be past,
When I my lady's face shall see,
And hear her words at last.

Oh, that the happy day would rise,
When she for whom I wait
Will come from the dim land that lies
Beyond the Ivory Gate!

DOLLS.

'A DOLL,' according to Dr Johnson, 'is a puppet or baby for a little girl to play with.' This definition we consider to be unworthy of the mind which framed it. The word 'puppet' recalls to our mind's eye only an unpleasantly lively Jack-in-the-box, or two little ugly boxing-men fastened together with a string; while a 'baby' suggests only a 'long baby,' which may be pleasant enough to dress and undress, or to christen, or rock in a miniature cradle, or take out driving in a miniature perambulator, but which at a doll's tea-party is simply a nonentity, and which can no more have wild adventures by flood and fell, or camp out, or marry another doll and set up housekeeping in a house with a small green front door (for show), and a large white back one (for use), than the cat could—rather less, in fact. As for the 'little girl'—well, evidently in Dr Johnson's day the little girls were more exclusive, or the little boys more contemptuous of their sisters and their sisters' dolls. Or perhaps Dr Johnson, being an unpleasant child with an unhealthy fondness for tea, and who carried about uncompiled dictionaries in his head while he was as yet of tender years, if he did ever, in a misguided moment, condescend to play with a puppet or baby, was ashamed of the fact, and wished it to be buried in oblivion. Whatever the case was, we again repeat the statement that the definition is insufficient; and had Dr Johnson made any study, however slight, of dolls as a class or of dolls in particular, it is almost needless to say that he would have perceived his error.

Who was the first child that ever played with a doll, it would be hard to say; but we do not doubt that the earliest children of the earth possessed dolls as well as the later ones. That the ancient leader of the Hebrews, when he was but little Moses, had a doll may be regarded as amounting almost to a certainty; for in those tiny sarcophagi which are discovered in Egypt, there have been found beside the poor little mummies—only mummies now, but which were once bright

little dark-eyed children of Egypt, full of mischief and glee—pathetically comical little imitations of themselves, placed there by loving mothers within reach of the cold little baby fingers. That reminds us of another baby figure, a little girl's, which was found in one of the Buried Cities with a doll clasped to her breast.

The doll, of which the modern doll is just a reproduction with improvements, emigrated from Holland to Britain some centuries ago; but before her advent there must have been a British doll of some sort or other; and we doubt not that at the time when art was first awakening in our islands, and when our ancestors painted themselves and each other blue, the children of the tribe, or, according to Dr Johnson, the little girls, had dolls, also painted blue, which must certainly have been a great saving in clothing to those small British matrons. It is a fallacy to suppose that a doll, in order to be a doll, must be of almost perfect physical construction, with limbs well stuffed with sawdust or bran, and with a ruddy complexion and large dark eyes. Such is not the case; and perhaps if we were to make investigations we should find that the ragged little gutter child who hugs in her arms, with true motherly pride and devotion, the very dirtiest of dirty shawls or old pinafores, tied in a large knot at one end, gets more pleasure out of her doll than does the little aristocrat at the west end, whose doll is a native of Paris, with golden hair, and eyes that open and shut, which has teeth and a voice, can do almost everything but speak the language, and possesses a costume for every day in the week. There is not a doubt that the more a child needs to exercise its imaginative faculty with regard to its playthings, the happier it is, and the more chance does it get of bringing its ingenuity and originality into play in its future life. What effect Ruskin's bunch of keys, and cart, and ball, and boxes of well-cut bricks—the sum-total of his childhood's playthings—had on his after-career, it would be hard to say; but he tells us how he could at an early age 'pass his days contentedly

in tracing the squares and comparing the colours of his carpet, and examining the knots in the wood of the floor, or counting the bricks in the opposite houses.' Poor little embryo art critic!—getting, perhaps, as much enjoyment out of the ugly red bricks of the sooty London houses, as he may have got afterwards in contemplating the architecture of St Mark's or of the Doge's Palace.

Far away in a lonely Yorkshire parsonage, about the same time that little John Ruskin was counting the bricks, or admiring the squares in his carpet, some remarkable children were amusing themselves in their own unchildish ways—writing little dramas, poems, and romances, and playing their 'secret plays' with their dolls, which were wooden soldiers, mostly titled, and generally either statesmen or men of genius. 'Mine was the prettiest of the whole, and the tallest, and the most perfect in every part,' wrote Charlotte Brontë. 'He was the Duke of Wellington.' Jane Welsh Carlyle's doll had more of the real about it than Charlotte Brontë's, but its end was such as few dolls can hope to have. She always loved her doll; but when she had got into the first book of Virgil, she thought it shame to care for her any longer, and having judged the poor victim, decided that she must die, and die as be seemed the doll of a young lady in Virgil. With some lead pencils, her four-post bed, her dresses, which were many, a few sticks of cinnamon, and a nutmeg, she built the doll a funeral pile, and poured over it all some sort of perfume. Then the doll, being seated upon her four-post bed, recited, with her judge's aid, the last speech of Dido, stabbed herself with a penknife, and perished there nobly. But, alas, the student of Virgil had miscalculated her own callousness. As the flames hungrily licked up the second Dido and her stuffing of bran, poor little 'Jeanie's' affection all came back, and she would have saved her doll when it was too late; and when she could not, burst into such cries of anguish as brought out her alarmed friends, who carried her forcibly into the house. It seemed a sort of portent of what her life was to be, poor little woman—a life of sacrifices, sometimes needless ones too, and sacrifices which would have been better left unmade; a life in which she tried to do away with the fact that she could love as few people can, and tried to take life as a Stoic would, or as did the little Spartan boy who would not complain even when his very heart was being gnawed away.

With ordinary children, a doll plays many parts, and, curiously enough, a child's doll always seems to bear a strong resemblance to the child in constitution and disposition, if not in appearance. A selfish child has always a selfish doll; and a delicate child's doll is always ill. A doll we once knew was passionately fond of preserved ginger; and as sure as there was any ginger in the house, so sure was that brazen-faced doll to demand some, and force its owner, with much reluctance and many apologies, to beg for just a tiny bit in order to satisfy its cravings. Curiously enough, if that doll's owner had a weakness, it was a weakness for preserved ginger.

Another doll of our acquaintance—a very dear friend of ours in days gone by—a doll named Franky, of a dark (tan-glove) complexion, utterly

without backbone, and who always wore a Norfolk jacket and suit of red flannel, once expressed—after seeing an officer of the Black Watch—a wild desire to possess a complete Highland costume. He had once before wanted a popgun, and had—through persistently asking for one—always through the medium of his much embarrassed proprietor, of course—got three popguns of various sizes presented to him by friends of the family; and so he thought it well to pursue the same method as previously. He did so, but with what results! Certainly, he obtained kilts, with a sporran, velvet jacket, and everything complete. But the kind friend who donated the costume, thinking it would be a pleasant surprise for his owner if she altered Franky's complexion for the better, bestowed upon him a new face of an unhealthy (white-kid-glove) hue, and very correct features, with the most inane expression imaginable. Alas for Franky! From that day his doom was sealed. At first, his owner disowned him; and it was only after she had made a careful scrutiny of his limbs, hair, and pedal extremities, that she would acknowledge in this horribly vapid Highlander her own beloved but strangely transmogrified Franky. Almost immediately, Franky took scarlet fever, and had to be isolated in a disused cradle in the lumber-room. Of course, having other children to look after, it would not have been right for his owner to run the risk of nursing him, and so she allowed him to be tended by three (imaginary) hospital nurses. One day, her maternal affection overcame her fear of contagion, and she penetrated the sickroom, caught him up from his cradle, and kissed him passionately; but the sight of his sickly face and idiotic expression was too much for her, and, with a sudden revulsion of feeling, she cast him away with loathing and disgust. That is many years ago; but we believe the hapless Franky, still attired in full Highland costume, lies in that lumber-room, suffering from a long-protracted attack of scarlet fever, and without even the imaginary hospital nurses to tend his sickbed.

Poor Franky! he is not alone in his misfortune. We wonder how many like cases would be revealed to the public, were all the lumber-rooms and old 'doll closets' in the United Kingdom to undergo strict investigation. What startling revelations and harrowing details there would be, and what a fearful list of mutilated and disfigured bodies, and unrecognisable remains, we should have to make! Perhaps, like Maggie Tulliver's unfortunate doll, some of the harmless victims might have been used as substitutes for some real offender, and been hammered and hacked and knocked about in an unjust and brutal manner. Perhaps still more might have fallen victims to a younger generation than their owners, possessed of much curiosity and a genius for dissecting; while more still might be only the victims of neglect—once idolised and honoured members of society, but now despised, unloved, and stowed away in odd corners, while their once devoted friends amuse themselves with the big world's playthings; or have stopped playing altogether, said good-night, and gone to sleep for ever. Poor old 'puppets and babies,' what happiness you have given! How many memories, happy and sad, how many days of sunshine and of rain, you bring back to us! How can we,

though our playground be wider, and our plays bigger and more complex, yet not so happy, keep from having a warm little corner in our hearts for what we once loved so much—our dolls!

THIS MORTAL COIL.

CHAPTER IX.—HIGH-WATER.

MEANWHILE, Warren Relf, navigating the pervasive and ubiquitous little *Mud-Turtle*, had spent his summer congenially in cruising in and out of Essex mud-flats and Norfolk broads, accompanied by his friend and chum Potts, the marine painter—now lying high and dry with the ebbing tide on some broad bare bank of ribbed sand, just relieved by a battle-royal of gulls and rooks from the last reproach of utter monotony; now working hard at the counterfeit presentment of a green-grown wreck, all picturesque with waving tresses of weed and sea-wrack, in some stranded estuary of the Thames backwaters; and now again tossing and lopping on the uneasy bosom of the German Ocean, whose rise and fall would seem to suggest to a casual observer's mind the physiological notion that its own included crabs and lobsters had given it a prolonged and serious fit of marine indigestion.

For a couple of months at a stretch the two young artists had toiled away ceaselessly at their labour of love, painting the sea itself and all that therein is, with the eyots, creeks, rivers, sands, cliffs, banks, and inlets adjacent, in every variety of mood or feature, from its glassiest calm to its angriest tempest, with endless patience, delight, and satisfaction. They enjoyed their work, and their work repaid them. It was almost all the payment they ever got, indeed, for, like loyal sons of the Cheyne Row Club, the crew of the *Mud-Turtle* were not successful. And now, as September was more than half through, Warren Relf began to bethink him at last of Hugh Massinger, whom he had left in rural ease on dry land at Whitestrand under a general promise to return for him 'in the month of the long decline of roses,' some time between the 15th and the 20th. So, on a windy morning, about that precise period of the year, with a north-easterly breeze setting strong across the North Sea, and a falling barometer threatening squalls, according to the printed weather report, he made his way out of the mouth of the Yare, and turned southward before the flowing tide in the direction of Whitestrand.

The sea was running high and splendid, and the two young painters, inured to toil and accustomed to danger, thoroughly enjoyed its wild magnificence. A storm to them was a study in action. They could take notes calmly of its fiercest moments. Almost every wave broke over the deck; and the patient little *Mud-Turtle*, with her flat bottom and centre-board keel, tossed about like a walnut shell on the surface of the water, or drove her nose madly from time to time into the crest of a billow, to emerge triumphant one moment later, all shining and dripping with sticky brine, in the deep trough on the other side. Painting in such a sea was of course simply impossible; but Warren Relf, who loved his art with supreme devotion, and never missed an

opportunity of catching a hint from his ever-changing model under the most unpromising circumstances, took out pencil and paper a dozen times in the course of the day to preserve at least in black and white some passing aspect of her mutable features. Potts for the most part managed sheet and helm; while Relf, in the intervals of luffing or tacking, holding hard to the mainmast with his left arm, and with the left hand just grasping his drawing-pad on the other side of the mast, jotted hastily down with his right whatever peculiar form of spray or billow happened for the moment to catch and impress his artistic fancy. It was a glorious day for those who liked it; though a land-lubber would no doubt have roundly called it a frightful voyage.

They had meant to make Whitestrand before evening; but half-way down, an incident of a sort that Warren Relf could never bear to miss intervened to delay them. They fell in casually with a North Sea trawler, disabled and distressed by last night's gale, now scudding under bare poles before the free breeze that churned and whitened the entire surface of the German Ocean. The men on board were in sore straits, though not as yet in immediate danger; and the yawl gallantly stood in close by her, to pick up the swimmers in case of serious accident. The shrill wind tore at her mainmast; the waves charged her in vague ranks; the gaff quivered and moaned at the shocks; and ever and anon, with a bellowing rush, the resistless sea swept over her triumphantly from stem to stern. Meanwhile, Warren Relf, eager to fix this stray episode on good white paper while it was still before his eyes, made wild and rapid dashes on his pad with a sprawling hand, which conveyed to his mind, in strange shorthand hieroglyphics, some faint idea of the scene as it passed before him.

'She's a terrible bad sitter, this smack,' he observed in a loud voice to Potts, with good-humoured enthusiasm, as they held on together with struggling hands on the deck of the *Mud-Turtle*. 'The moment you think you've just caught her against the skyline on the crest of a wave, she lurches again, and over she goes, plump down into the trough, before you've had a chance to make a single mark upon your sheet of paper. Ships are always precious bad sitters at the best of times; but when you and your model are both plunging and tossing together in dirty weather on a lippy channel, I don't believe even Turner himself could make much out of it in the way of a sketch from nature.—Hold hard, there, Frank! Look out for your head! She's going to ship a thundering big sea across her bows this very minute.—By Jove! I wonder how the smack stood that last high wave!—Is she gone? Did it break over her? Can you see her ahead there?'

'She's all right still,' Potts shouted from the bow, where he stood now in his oilskin suit, drenched from head to foot with the dashing spray, but cheery as ever, in true sailor fashion. 'I can see her mast just showing above the crest. But it must have given her a jolly good wetting. Shall we signal the men to know if they'd like to come aboard here?'

'Signal away,' Warren Relf answered good-humouredly above the noise of the wind. 'No more sketching for me to-day, I take it. That

last lot she shipped wet my pad through and through with the nasty damp brine. I'd better put my sketch, as far as it goes, down below in the locker. Wind's freshening. We'll have enough to do to keep her nose straight in half a gale like this. We're going within four or five points of the wind now, as it is. I wish we could run clear ahead at once for the poplar at Whitestrand. I would, too, if it weren't for the smack. This is getting every bit as hot as I like it. But we must keep an eye upon her; if we don't want her crew to be all dead men. She can't live six hours longer in a gale like to-day's, I'll bet you any money.'

They signalled the men, but found them unwilling still, with true seafaring devotion, to abandon their ship, which had yet some hours of life left in her. They'd stick to the smack, the skipper signalled back in mute pantomime, as long as her timbers held out the water. There was nothing for it, therefore, but to lie hard by her, for humanity's sake, as close as possible, and to make as slowly as the strength of the wind would allow, by successive tacks, for the river-mouth at Whitestrand.

All day long, they held up bravely, lurching and plunging on the angry waves; and only towards evening did they part company with the toiling smack, as it was growing dusk along the low flat stretch of shore by Dunwich. There, a fish-carrier from the North Sea, one of those fast long steamers that plough the German Ocean on the lookout for the fishing fleet—whose catches they take up with all speed to the London market, fell in with them in the very nick of time, and transferring the crew on board with some little difficulty, made fast the smack—or rather her wreck—with a towline behind, and started under all steam, to save her life, for the port of Harwich. Warren Relf and his companion, despising such aid, and preferring to live it out by themselves at all hazards, were left behind alone with the wild evening, and proceeded in the growing shades of twilight to find their way up the river at Whitestrand.

'Can you make out the poplar, Frank?' Warren Relf shouted out, as he peered ahead into the deep gloom that enveloped the coast with its murky covering. 'We've left it rather late, I'm afraid, for pushing up the creek with a sea like this! Unless we can spot the poplar distinctly, I should hardly like to risk entering it by the red light on the sandhills alone. Those must be the lamps at Whitestrand Hall, the three windows to starboard yonder. The poplar ought to show by rights a point or so west of them, with the striped buoy just a little this side of it.'

'I can make out the striped buoy by the white paint on it,' his companion answered, gazing eagerly in front of him; 'but I fancy it's a shade too dark now to be sure of the poplar. The lights of the Hall don't seem quite regular. Still, I should think we could make the creek by the red lantern and the beacon at the hithe, without minding the tree, if you care to risk it. You know your way up and down the river as well as any man living by this time; and we've got a fair breeze at our backs, you see, for going up the mouth to the bend at Whitestrand.'

The wind moaned like a woman in agony. The timbers creaked and groaned and crackled. The black waves lashed savagely over the deck. The *Mud-Turtle* was almost on the shore before they knew it.

'Luff, luff!' Relf called out hastily, as he peered once more into the deepening gloom with all his eyes. 'By George! we're wrong. I can see the poplar—over yonder; do you catch it? We're out of our bearings a quarter of a mile. We've gone too far now to make it this tack. We must try again, and get our points better by the high light. That was a narrow squeak of it, by Jove! Frank. I can twig where we've got to now, distinctly. It's the lights in the house that led us astray. That's not the Hall: it's the windows of the vicarage.'

They ran out, to eastward again, for more sea-room, a couple of hundred yards, or farther, and tacked afresh for the entrance of the creek, this time adjusting their course better for the open mouth by the green lamp of the beacon on the sandhills. The light fixed on their own masthead threw a glimmering ray ahead from time to time upon the angry water. It was a hard fight for mastery with the wind. The waves were setting in fierce and strong towards the creek now; but the tide and stream on the other hand were ebbing rapidly and steadily outward. They always ebbed fast at the turn of the tide, as Relf knew well: a rushing current set in then round the corner by the poplar tree, the same current that had carried out Hugh Massinger so resistlessly seaward in that little adventure of his on the morning of their first arrival at Whitestrand. Only an experienced mariner dare face that bar. But Warren Relf was accustomed to the coast, and made light of the danger that other men would have trembled at.

As they neared the poplar a second time, making straight for the mouth with nautical dexterity, a pale object on the port bow, rising and falling with each rise or fall of the waves on the bar, attracted Warren Relf's casual attention for a single moment by its strange weird likeness to a human figure. At first, he hardly regarded the thing seriously as anything more than a stray bit of floating wreckage; but presently, the light from the masthead fell full upon it, and with a sudden flash he felt convinced at once it was something stranger than a mere plank or fragment of rigging.

'Look yonder, Frank,' he called out in echoing tones to his mate; 'that can't be a buoy upon the port bow there!'

The other man looked at it long and steadily. As he looked, the *Mud-Turtle* lurched once more, and cast a reflected pencil ray of light from the masthead lamp over the surface of the sea, away in the direction of the suspicious object. Both men caught sight at once of some floating white drapery, swayed by the waves, and a pale face upturned in ghastly silence to the uncertain starlight.

'Port your helm hard!' Relf cried in haste. 'It's a man overboard. Washed off the smack perhaps. He's drowned by this time, I expect, poor fellow.'

His companion ported the helm at the word with all his might. The yawl answered well in spite of the breakers. With great difficulty,

between wind and tide, they lay up towards the mysterious thing slowly in the very trough of the billows that roared and danced with hoarse joy over the shallow bar; and Relf, holding tight to the sheet with one hand, and balancing himself as well as he was able on the deck, reached out with the other a stout boathook to draw the tossing body alongside within hauling distance of the *Mud-Turtle*. As he did so, the body, eluding his grasp, rose once more on the crest of the wave, and displayed to their view an open bosom and a long white dress, with a floating scarf or shawl of some thin material still hanging loose around the neck and shoulders. The face itself they couldn't as yet distinguish; it fell back languid beneath the spray at the top, so that only the throat and chin were visible; but by the dress and the open bosom alone, it was clear at once that the object they saw was not the corpse of a sailor. Warren Relf almost let drop the boathook in horror and surprise.

'Great heavens!' he exclaimed, turning round excitedly, 'it's a woman—a lady—dead—in the water!'

The billow broke, and curled over majestically with resistless force into the trough below them. Its undertow sucked the *Mud-Turtle* after it fiercely towards the shore, away from the body. With a violent effort, Warren Relf, lunging forward eagerly at the lurch, seized hold of the corpse by the floating scarf. It turned of itself as the hook caught it, and displayed its face in the pale starlight. A great awe fell suddenly upon the astonished young painter's mind. It was indeed a woman that he held now by the dripping hair—a beautiful young girl, in a white dress; and the wan face was one he had seen before. Even in that dim half-light he recognised her instantly.

'Frank!' he cried out in a voice of hushed and reverent surprise—'never mind the ship. Come forward and help me. We must take her on board. I know her! I know her! She's a friend of Massinger's.'

The corpse was one of the two young girls he had seen that day two months before sitting with their arms round one another's waists, close to the very spot where they now lay up, on the gnarled and naked roots of the famous old poplar.

MODERN DIVINATION.

It might have been supposed that in 1887, a year so close to the end of a century celebrated for the great strides made in all matters of science, it would hardly have been possible to find an educated man resorting to divination for the discovery of water; nevertheless, the following extract from a local paper (the *East Anglian Daily Times*) will show that belief in the art of the diviner is far from extinct; neither is it by any means confined to the ignorant peasantry, as is the case with many superstitions which still survive among us. The extract is headed, 'Remarkable Experiments in Suffolk,' and is as follows:

'For the double purpose of remedying the deficiency in the water-supply, and of fixing in the parish something permanent and beneficial

in commemoration of Her Majesty's Jubilee, a movement has been set on foot by the rector of Wattisham, Suffolk, to sink a well, in a central and convenient spot, for the general use of the villagers. This project has the support of the leading parishioners, and on the 28th of September the first active steps were taken to put the scheme into execution. To avoid if possible the unnecessary labour and cost frequently attendant on boring for water, the novel experiment of discovering exact places where a supply could be found by the art of "divination," was put into practice on the day mentioned. Through the instrumentality of the Rev. — Drake, of Brockley, a Mr Lawrence, from Bristol, attended as diviner. The articles used for the purpose of indicating the presence of water underground were a piece of steel spring about a foot in length and a V-shaped hazel stick. The yard behind Wattisham Hall was first selected for the trials. With the piece of spring held in a bowed shape in front of him, and firmly grasped with both hands, the operator slowly stepped about the yard. In a very short time, and at one particular spot not far from the house, the spring began to twist and curve about in the most uncontrollable manner. With the hazel stick tightly held apex downwards, he again stepped towards the same spot, when the upward movements and twists of the stick were so violent as to break it. Mr Lawrence predicted that at this spot a plentiful supply of water would be found. A small piece of common land opposite the church was next tested in the same manner, and at one spot both the spring and the hazel stick again denoted by their active movements the presence of water. This spot is now marked by a small stone bearing an inscription, "V.R. Jubilee, 1887," as here it is proposed to sink the well for the parish. After some careful searching on the premises of an off-lying farm called Judgments, belonging to Mr Harvey, a spot was discovered in the orchard in the same way, the hazel sticks moving so vigorously on each occasion as to break in the divinator's hands. At Hitcham Lodge, the residence of Mr Hammond, boring operations have been carried on at some considerable expense to the owner, and although a depth of over one hundred feet has been reached, no water has been discovered. A visit was paid by Mr Lawrence, and within fifteen feet of the site chosen by Mr Hammond for his well, a spot was pointed out where water would be found, and, in the operator's opinion, at not half the depth now bored. A certain amount of scepticism prevailed as to the efficiency of the tests with some of those who were present; but it is hoped that an early commencement of boring operations, with a subsequent discovery of water at some or all of the spots indicated, will dispel all doubts, although the mystery—for such it still appears—remains unsolved.'

Now, this resort to the diviner for the discovery of water, strange as it may appear to many, is by no means uncommon in the *west* of England; and it will be seen that in this instance the 'dowser,' as he is termed locally, was sent for from Bristol, none being apparently known in the eastern counties.

Some years ago, the writer had the good fortune to witness near Bath an experiment almost pre-

cisely similar to the above, and can therefore testify to the accuracy of the description given by the reporter of the method employed by the diviner, excepting that in the one witnessed by us there was no metal spring employed, but simply the hazel wand; and it is certainly most interesting to observe the sudden and apparently uncontrollable movement of the wand, as held by the diviner, in certain spots, whilst it remains perfectly inert in others, and again, perhaps, moves very slightly. By the violence of the movement the diviner decides as to the nearness and volume of the water; and we may say that in the case referred to near Bath, a well had been dug unsuccessfully to a great depth before the dowser was called in; but in the spot indicated by him, water, although not commensurate with the violence of the rod, was found at a much less depth, within a few yards of the first abortive attempt.

The success which usually follows the indications of the diviner naturally accounts for the continued popularity of a practice which dates back to far distant prehistoric times; and although it is now shorn of many of the rites and ceremonies which once accompanied it, and may be looked upon rather as a psychological curiosity than a superstition, the practice is full of interest both in its past and present use.

In the first place, it must be observed that the diviners of the present day are few in number,—they themselves say not one in a thousand has the power of the rod; and, indeed, a group of spectators may narrowly watch the proceedings of a dowser, and try one after another to imitate them in vain, till some young girl or some old man among them, taking the wand in hand, finds, to his or her surprise, that he or she is gifted with the strange power, and the rod turns just as it has done in the hands of the expert. The cause of the phenomenon has yet to be explained; in some cases, it may be, and probably is, imposture. The late Dr Carpenter believed that where every kind of suggestion had been rigidly excluded, failure was certain, and that success was in all cases due to guesses on the part of the performer, or to the unintentional promptings they have received from bystanders, just as in the modern thought-reading performances. But it is certain that many of those who accidentally find themselves endowed with the 'power of the rod' cannot be classed among impostors, neither have they anything to gain by exhibiting that power; and we do not think the sudden and peculiar motion of the rod could be produced unconsciously, although some French *savants* have supposed that the movement in the rod is due to the tension of the muscles held long in one position, resulting in involuntary motion. Sometimes, however, the rod will turn immediately it is taken in the hand, when held over running water.

A more plausible explanation is, that persons possessing some peculiarity of nervous temperament, or subject in a special degree to rheumatism or neuralgia, would be more easily affected than others by the presence of water, and that in their hands the rod would serve as an indicator, although in what way the peculiar upward motion of the rod is produced requires considerable explanation; and the matter is further complicated by the fact that the rod is employed not

only to find water but also metals. Anciently, its functions were still further enlarged, and it was used to mark out boundaries, to discover corpses, and to bring to justice murderers and thieves.

In what way it traced boundaries we do not know; but if it could be thus employed at the present day, it would be very useful, and save a good many disputes, ending not unfrequently in wars; so that it seems a pity that the lost belief in its virtues cannot be revived. Hermes, the god of boundaries, is always represented with the caduceus, which was doubtless the magic wand thus employed; and the older Egyptian Hermes or Thoth taught the Egyptians to measure their fields; whilst Romulus employed a *litnus*, which Plutarch describes as a bent stick, to measure out the various regions of Rome. This *litnus* was afterwards laid up in the temple of Mars as a precious relic.

In the present day, the rod is used only to discover water and metals. In Cornwall it is very commonly called into requisition for the latter purpose; and Cornish miners, gifted with the power of the rod, have been employed to search for metals and for water both in Australia and South Africa, and, we believe, generally with success. It is possible that their success may be traced to some knowledge picked up of geological features, or not unfrequently of peculiarities of vegetation in the near neighbourhood of metals and of water. But it must be borne in mind that the vegetation of Australia and the Cape differs too much from that of Cornwall to serve as indications to a stranger; nevertheless, it is easy for a shrewd man to pick up from settlers the description of plants chiefly found near watercourses or mineral deposits. In Cornwall, the veriest tyro in geology would know that serpentine might be found wherever he saw the Cornish heath growing; and so with various other plants and shrubs which love certain soils and will not grow elsewhere; and it is probable that a knowledge of botany might be as useful to the 'prospector' for metals as that of geology; but it is the fact of the movement of the rod in *unskilled* hands, and in places where neither geology nor botany could be a guide, which requires explanation.

It is, however, in the ancient and widespread use of the rod as an implement of divination that the chief interest of the subject lies. All writers who have treated of rhabdomancy, or divination by the rod, have agreed in assigning to it a very high antiquity. They trace it from Scythia, where it is supposed to have originated, to Assyria, Palestine, Greece, Etruria, Rome, and by another route, through Russia and Germany to England. But if we may judge from sculptures, the use of the rod was by no means confined to the eastern hemisphere, for a very ancient Peruvian sculpture represents a figure bearing a forked stick, upon which is perched a bird, both being emblems of divination and augury.

Many traces of this old form of divination may be found in the Bible. Jerome, Cyril, and other commentators assert that the Jews learnt this form of divination in Babylon. The passage in Hosea iv. 12, 'My people ask counsel at their stocks, and their staff declareth unto them,' is referred to the practice of rhabdomancy; and it

is : hey consulted at the same time
 bot. the idol, the figure of some god
 bein. the rod ; an idea which receives
 some the fact that in later times
 a cross tly engraved on the divining-
 rod. ribes four old divining-rods
 found i. hich were inscribed the names
 of the th ultazar, Gaspar, and Melchior.
 The rod and Aaron will naturally
 occur to t. his connection, especially in
 the mirac ing of water from the rock
 by the foi diviners were not slow in
 taking Mose ample of the power of the
 rod, and the adopted as the special tree
 from which ds should be cut, from a
 belief that it wood which was used by
 Moses to sweet waters of Marah ; or, as
 some say, beca ts faint resemblance to
 the almond, of the rod of Aaron was
 composed.

The rod of Aa of almond ; but tradition says that th . Moses—which was called the rod of the prophets—was cut by Adam from a myrtle of paradise, and was given to him by Shoaib, the father of Zipporah, to whom it had descended, in order to drive away the wild beasts from his flocks. The power of this rod of Moses over the waters was not confined to bringing water from the rock ; it was also used to convert the rivers and streams of Egypt into blood, and to divide the waters of the Red Sea. It was probably from this apparently divine approval of the use of rods in various ways, that permission was given by law to the Frisians, after their conversion to Christianity, to use divining-rods in proving homicide, and the ceremony was performed in church before the altar. Two twigs, one marked with the sign of the cross, were covered with clean wool and laid upon the altar or the holy relics, and a prayer made that God would by a sign discover the guilty.

It cannot be doubted that in all countries and in all ages, the rod or staff, either plain or variously ornamented, has been used as a symbol of authority ; the sceptre of modern monarchs has been handed down from the kings and gods of Rome, Greece, Etruria, Babylon, India, and Egypt ; and Bancroft (*Native Races of the Pacific*) says : 'The merchants of Mexico had a god called Zeacatecoatl, the god who guides. The principal image of this god was the figure of a man walking with a staff. Practically, however, every merchant revered his own staff as the representative or symbol of this god.' Hence we see that veneration for the rod or staff is by no means confined to the eastern hemisphere, although we are better acquainted with the history of divination by the rod in the Old World than in the New.

Lenormant, in his book on *Les Sciences Occultes en Asie* points out the extreme development of this superstition among the Fins ; he says : 'Whatever might be the power of those enchantments which controlled nature and supernatural beings, spirits, and gods, there is a talisman still more powerful, for it arrests their effect, and protects from it those who possess it : it is the "celestial rod," analogous to the divining-rod of the magi of India. The gods themselves can only be secured against certain enchantments by virtue of this rod. Wainamöinea, menaced by the chief sorcerer of Lapland, replies to him : "The Lapp

cannot injure me by his enchantments, for I have in my hand the celestial wand ; and he who hates me, he who creates mischief, does not possess it.'" Magicians everywhere used a wand or rod with which to command or control the spirits they summoned, and with it they traced circles or other signs on the ground, within which figure the enchantment was confined. Of these forms, the circle was the most common ; it doubtless indicated the sun, whilst the crescent indicated the moon ; and it is to this latter that the form of the divining-rod may, we think, be traced, for the power of the moon over water was recognised in very ancient times. The moon-god was symbolised by horns, which are everywhere emblems of power, and by forked sticks resembling horns ; hence, twigs were used by the Anglo-Saxons for casting lots, and are still used by the Hottentots in the same manner.

Two very curious survivals of the old superstitions connected with the use of forked sticks in divination may still be traced in common use : one is the practice of breaking the merrythought of a fowl, the bird specially used in augury, in order to have a wish ; and the other is the 'making horns,' by pointing the first and fourth fingers at a person credited with the possession of the 'evil-eye,' in order to avert the ill effects of such a person's glance. This is still in common use in Italy, and probably in other eastern lands.

It is perhaps hardly surprising that with so many respectable authorities to vouch for the 'power of the rod,' there should still remain believers in its efficacy ; for we all know how difficult it is to eradicate any belief or any ancient custom which has once taken possession of the mind of the populace. There are innumerable old customs still surviving which may be traced back to prehistoric times, and amongst them, this of the use of the divining-rod ; nevertheless, it will remain as a singular page in the history of 1887, that, in commemoration of the Jubilee of Queen Victoria, a well was dug in Suffolk on a spot indicated by a divining-rod in the hands of an expert summoned from Bristol for the purpose.

HELEN'S ESCAPE.

CHAPTER III.

JACK CORNER's opinion about Monsieur Pontneuf naturally produced a vivid impression upon me ; for the notion that my quiet, polite, refined professor could be the accomplice of men whose notions and acts were just at this time arousing the horror of the civilised world, had never entered my head. But when I came to think over it, the idea was not so ridiculous as it had at first appeared ; for the position of Monsieur Pontneuf in my house was just such a one as would disarm suspicion, and he had innumerable opportunities of corresponding and plotting and arranging without the smallest chance of detection. Still, there was not sufficient reason for me to take any action in the matter, and certainly the scrap of conversation I had overheard in the summer-house did not strike me as being of a particularly compromising nature ; indeed, the impression I gained therefrom was that Monsieur Pontneuf, so far from being 'wanted' himself, was on the lookout for somebody else. But Jack Corner was not the sort

of man to hint so grave a suspicion against any one without good reason, and I felt sure that he must have overheard or have learnt something which had warranted him in saying what he did to me.

As we were going to Paris the next day, and as Jack was about to start on what he called 'his farewell bachelor jaunt,' I had asked him to dine with us, and it occurred to me that Monsieur Pontneuf might join our party, although I knew that as a rule he kept aloof from all social entertainment. To my surprise, the professor gladly and readily accepted my invitation; and appeared at the appointed time, faultlessly arrayed, and looking as unlike the ideal assassin of czars and destroyer of public buildings as could be imagined.

During the dinner, Monsieur Pontneuf showed himself in quite new colours: all his reserve and shyness disappeared; he charmed my wife with his intelligent talk, and still more so by the masterly manner in which he operated on a pair of ducks. He laughed and chatted and joked until it became hard to realise that he was identical with the 'Dismal Froggy' of the villagers.

When the ladies had withdrawn, and a bottle of my choice Burgundy was placed on the table, he expanded still further, until I really regretted that during so long a period I had been without the society of so charming a companion. It was now for the first time that he learned that I had been in Paris during the siege and under the Commune, and the subject seemed to interest him very much, especially when I related the episode of Mr Rayne's mysterious arrival and departure. I asked him what he thought about Mr Rayne.

'It is plain enough what he was,' replied the professor. 'He was one of that rascally so-called Foreign Legion enlisted from the scum of all the great cities of Europe—men who had nothing to lose and everything to gain, who hailed the supremacy of the Commune as an opportunity for enriching themselves at the expense of others; and to whom is due, quite as much as to my own countrymen, the shameful destruction of public buildings. He had probably been caught pillaging and had escaped to you.'

Jack Corner spoke villainous French, but he could understand most of what was said.

'Is Monsieur a Republican?' he asked.

I should state here that before the professor had arrived, Jack had told me that he intended, if possible, to find out who and what our guest was, and I knew that with this simple question Jack was commencing his 'pumping' process, especially as he pushed the bottle to the professor as often as he could, with the idea, no doubt, of loosening the professor's tongue.

'No, sir,' replied Monsieur Pontneuf with true refugee dignity. 'I am a Bonapartist—one of a party almost as much detested in Paris just now as a Communeard or a German, or I should not be teaching my native language in England.'

I took no part in the conversation which ensued between the two men, a conversation which, under a social guise, reminded me very much of a passage of wit between a clever cross-examining counsel and an equally clever witness. Indeed, I was rather interested in the result; and in order that my presence should not act as a deterrent,

I had another bottle brought on table, and after entreating my guests not to hurry themselves, left the room on the plea that I had a few domestic arrangements to see to. There was nothing unbecoming as a host in my doing this, for we never gave formal dinner-parties, and I knew that Jack Corner's aunt was perfectly happy in the drawing-room, talking local gossip with my wife, and listening to Helen's old English ballads at the piano.

My two guests, however, must have been vastly absorbed in their talk, for I had been an hour in the drawing-room before Jack came in. I noticed that he was rather pale, and when he turned over the leaves of Helen's music, that his hand shook; so I took the first opportunity of asking him what had passed between him and the professor, and why the Frenchman had not come in.

'He's a mystery—that's all I can tell you. I haven't got much out of him, for he is far too wide awake, and he has gone off without a word.'

'Gone off!' I exclaimed. 'What do you mean, Jack? I hope you haven't offended him?'

'I hope not,' replied Jack, smiling. 'But I think he began to see the drift of my talk, and I don't think he liked it. However, I may be mistaken, and after all, it is perhaps only his eccentricity.'

Helen and Jack sang duets together, and Jack gave us a rollicking song of the sea, and then we sat down to a quiet rubber of whist, which occupied us until eleven o'clock, when Miss Corner, an old lady of the 'smiler' type, pleased with everybody and everything, showed signs of fatigue.

I escorted them to the gate and afterwards took a stroll alone in the moonlight. Of course the chief place in my thoughts was occupied by the professor, and I could not satisfactorily account for his sudden disappearance from my house, for, so far as I could judge from his usual behaviour, he was the very last man to commit such a breach of good manners as to go away without a word of explanation or farewell. The result of a prolonged meditation, during which I had wandered almost as far as the summer-house, was, that I felt convinced that Jack had been right, and that Monsieur Pontneuf was in reality a great deal more important a personage than he chose to be taken for, whatever the mystery that surrounded him might be. The distant boom of midnight from the church tower warned me that I had gone far enough, if I wished to have a good night's rest before my journey on the next day, and I was turning homewards, when a black patch on the light sandy soil attracted my attention. Stooping down and touching it, I found it stained my finger a dark colour. I struck a light, and saw it was blood. I am not a very nervous man; but I must admit that the coming upon this appalling indication of a dark deed at such a lonely spot, at such a weird, still hour of the night, produced a feeling within me which was closely akin to terror. Then I noticed that there was blood farther on, patch after patch, as if some one had been wounded and dragged or had dragged himself along. I followed it until it stopped; but the trampled and torn appearance of the bushes on the stream side of the path showed me that some one had passed down towards the stream, which at this place forms a

deep wide pool. Down I went in the bright moonlight, guided by the appearance of the bushes, until, as I anticipated, all further traces were lost at the water's brink. I looked carefully about for some tell-tale relic of what had happened—a shred of cloth or an article of clothing; but there was nothing. I felt sure that something terrible had been enacted here, and instantly I associated Monsieur Pontneuf with it, although I scarcely dare think that Jack Corner was the victim.

I stood horror-struck for some moments, unable to collect my thoughts, irresolute as to how I should act; and the longer I stood, the more firmly I became convinced that my suave, urbane professor was, as Jack Corner had suspected, a fiend in human shape—that Jack had spoken too freely of his suspicions, and had been made an example of the saying that 'dead men tell no tales.'

Then I strode off in the direction of the Cedars, Jack Corner's house, situated but a quarter of an hour's walk from my own, in a sequestered little dell near the London Road. It was approached through a lodge-gate which opened on to a winding road through dark fir-trees; but Jack, who was of unostentatious habits, had dispensed with the services of a lodge-keeper, although, as the London Road was lonely and much infested by tramps, the gates were securely fastened every night. My surprise, therefore, may be imagined when I found the gates wide open, and my suspicions as to my poor friend's fate were thereby confirmed, for I knew that if Jack had returned home in the usual course, he would have seen that his premises were closed for the night. With a courage which could only have been the fruit of despair, I almost ran up the gloomy, weirdly shadowed road to the house. It was dark and silent, and although I rang and hammered at the door for a quarter of an hour, I could get neither reply nor admittance.

Another horrible notion crossed my mind as I stood there in the still night, wondering what my next step should be. Suppose that, after having disposed of Jack Corner, the murderer, in order more effectually to secure his escape, had gone to the house, had made away with Miss Corner and poor Gabrielle, and that a forced entrance into it would reveal their lifeless bodies?

Before, however, giving the alarm and procuring the assistance of the police, I determined to visit Pontneuf's lodging in the village; and I began to retrace my steps down the avenue. I stopped short after I had gone a little way, and for the first time I remembered Jack Corner's coachman, who was also man-of-all-work—reported to be the favoured swain of Gabrielle—who slept over the stable, and who, although he was sufficiently far from the house to be unaware of anything that might occur there, might aid me in my investigation. Accordingly, I turned off to the stable; and here another surprise awaited me. The doors of the coachhouse were wide open, and the little pony-trap, which I knew Jack had bought as a wedding present for my Helen, was not visible. I called out to the coachman above, but could get no reply; so I lit a stable lantern, and, prepared for further horrors, ascended the stairs. The man's door was open, and he was lying on his bed, so gagged with his own neckcloth that he could neither see nor speak, whilst his arms and legs were

securely fastened with carriage straps; but I was relieved to find that at anyrate he was alive, for upon my entering the room, he moved. I quickly released him from his bonds, and, stammering with excitement and fright, he told me that he had gone to bed as usual at ten o'clock, and had fallen asleep; that he was violently awakened by feeling the neckcloth tied tightly over his face; that on attempting to rise, he found that his legs had already been bound, and that, in spite of his struggles, his arms were presently bound also. He could not tell me who had done it; but said that immediately afterwards he heard the pony put into the trap and driven off.

To my mind, therefore, it was clear that Pontneuf had escaped. However, with the coachman I went on to the cottage where the professor lodged, and after some difficulty, succeeded in awaking the owner. 'Is Monsieur Pontneuf in?' I asked.

'Yes, sir, I believe so,' replied the man. 'I've been abed since nine o'clock, so I couldn't say for sartin sure, but he generally is in at this time.'

'Get a light, and let us see,' I said.

The man hesitated. Perhaps he thought I had been drinking, to make such a request, for every one knew that I had a small dinner-party that evening, and that the Frenchman had been one of the guests.

'Do you hear? Look sharp! It's a matter of life and death,' I continued; and this brought him to his senses, for he presently appeared with a candle.

We went to the professor's room; the door was open, but the room was empty, although the Frenchman's portmanteau was there. I opened it, and within I found his dress-clothes, rammed in evidently with haste, soaked with water, torn, and bedabbled with clay and blood.

The two men stood gaping wonderingly at the clothes, for of course they knew nothing of what I suspected; but to me the case was clear. Words must have passed between my poor friend and the professor upon the subject of Socialism over that second bottle of wine. The Frenchman had gone out, had waylaid Jack, and, after a desperate struggle, had killed him, and flung his body into the stream. Then he must have gone on to the Cedars, perhaps have made away with Miss Corner and Gabrielle, bound and gagged the coachman, and escaped in his victim's pony-chaise.

So I impressed secrecy on the two men, but not with the faintest hope that they could keep such a *bonne bouche* of gossip to themselves, locked the door of the professor's room, and turned homewards, troubled in my mind not only how to take the immediate action which was necessary, but how to break the news to my wife and my poor Helen.

Then I thought of Miss Corner and Gabrielle; again turned back, called up the local constable, and with him proceeded to the house. We broke it open; we searched every nook and corner from attic to basement; but not a trace of either Miss Corner or of Gabrielle could we find, although their belongings were in their rooms. This completed the veil of mystery around the affair; and I felt that I had been completely outwitted by

this scoundrel, whom I had welcomed to my own hearth as a friend.

Early next morning—or rather that same morning, for it was past three ere I crept home to my anxious wife, whose curiosity I had to satisfy with a relation of what had happened—men were set to work to drag the stream for the body, which I felt sure lay hidden somewhere. But nothing was found—a strange fact, considering that the pool, although deep, was very small, and that the stream was both shallow and sluggish. There was picked up, however, a torn, bloodstained handkerchief, marked with the initials J. C.

When I returned home, heartbroken, and not knowing how next to act—for, during my quiet, monotonous life in this little place, my faculties for grappling with sudden emergencies had rusted—I found that my wife had told Helen of my suspicions. The poor girl's agony at this cruel dashing away from her lips of the cup of happiness she was about to taste, was the most painful thing I had ever witnessed; and I resolved that I would spare no time or trouble or expense in endeavouring to bring the villain to justice who had so foully wronged her.

We had a London detective down to aid the local police in their researches; but their united industry and sagacity could throw no light on the mystery; and at the end of three weeks we were as much in the dark as before.

When the clothing found in the professor's portmanteau was searched, there was found a small notebook, on the fly-leaf of which was written the name De Bussy. The book was alphabetically arranged with proper names of all nationalities, followed by addresses in Paris, London, Vienna, Berlin, and St Petersburg. One leaf alone was torn off almost from the top, and, to my amazement, I saw on the remaining fragment the name Rayne. Jack Corner's surmise had evidently been correct; the *soi-disant* professor was nothing else but a secret agent of the Socialist party; and I was convinced that the names in this book were those of other agents in various parts; and that the Englishman who had taken refuge in my room at the Rue de Douai six years previously was one. That this particular leaf, and this only, was torn was to me very significant.

SOME ARMLESS WONDERS.

THE feats which have been performed by persons born without hands and arms are surprising. Amongst women, they have ranged from the painting of portraits to the more homely work of sewing and knitting; while men with marked ability have carried on farming and other outdoor work requiring both strength and skill. These wonderful characters have attracted the attention of kings, peers, preachers, and other notable people, and the facts respecting them are of considerable interest. We give particulars of a few of the more famous examples.

The first person of this class of whom we have any account is John Valerius, a native of the Upper Palatinate of Germany. He was born in 1667, without hands or arms; and he had also the misfortune at an early age to lose his parents.

He had to exhibit himself, as the only means of making money. The feats he learned to perform with his toes and feet were marvellous. After visiting several countries, he arrived in London in 1698, and remained there until 1705. During the first year of his residence in England, a book was published containing a number of pictures representing him executing numerous feats, including the following: playing at cards and dice; shaving himself; standing erect on his left leg, holding a rapier between his great and second toe; balancing a chair with his right leg; balancing himself on a pedestal and taking up dice with his mouth; lying at full length with his head on the ground and recovering himself by the support of his left leg; lying on his back, taking up a glass of liquor and conveying it with his toes to his head; balancing a glass of liquor on his forehead; standing on a stool, taking a glass of liquor from the ground with his mouth; seated on a stool with both feet conveying a glass of liquor to the top of his head; seated on a stool and writing with his toes; seated on a stool, taking a pistol, and firing it with his right toes; seated on a low stool, he took up a musket, and by both feet discharged it. In bidding adieu to his visitors, he went through the ceremony in the most approved fashion. He took his hat from the floor, placed it on his head, and then removed it, bowed gracefully, and expressed his thanks to the company for their patronage.

A few years prior to the visit of Valerius to this country, there passed away in a remote Midland village, Sarah Tissington, the armless wonder of Carsington, Derbyshire. The particulars respecting her which have come down to us are brief, but full of interest, and occur in the parish register of her native village, under date of September 29, 1688, and are as follows: 'Sarah Tissington, a poor young woman, born into the world without any hands or arms, yet was very nimble and active in the use of her feet, with which she could not only take up things from the ground, and play at most childish games with her playfellows when she was a child; but also, when grown up, she could knit, dig in the garden, and do divers other services with her feet. She was aged twenty-four or twenty-five years, and departed this life the day and year aforesaid, born and buried at Carsington.'

Miss Hawtin, another native of the Midlands, attracted some notice in her day. She was born at Coventry, and was a pretty and intelligent woman. As a needlewoman she showed skill, and she was expert at cutting out with the scissors elaborate watch-papers. Her penmanship was of considerable merit. The operations she performed with her toes and feet almost equalled those done by folks having the use of their hands and arms.

Early in the reign of George II., Matthew Buchinger landed in England from the Continent, and made a great reputation. Some writers

regarded him as the greatest wonder that had visited this country. He was a very small man, only measuring twenty-nine inches in height. His announcements, written by himself, are very amusing, and detail the feats he performed. One of his notices is before us, and reads as follows :

BY AUTHORITY.

Lately arriv'd and to be seen at the Globe and Duke of Malbrough's House in Fleet Street, A German born without Hands, Feet, or Thighs, (that never was in this kingdom before), who does such miraculous Actions as none else can do with Hands and Feet. He has had the Honour to perform before most Kings and Princes, particularly several Times before King George. He makes a pen and writes several Hands, as quick and well as any Writing-master, and will write with any for a Wager ; he drawes Faces to the Life, and Coates of Armes, Pictures, Flowers, &c., with a Pen, very curiously. He threads a fine Needle very quick ; shuffles a Pack of Cards and deals them very swift. He plays upon the Dulcimer as well as any Musician. He does many surprising Things with Caps and Balls, and gives the Curious great Satisfaction thereby. He plays at Skittles several Ways very well ; shaves himself very dexterously, and many other Things too tedious to insert.

This is written by Matthew Buchinger, at London, 171 $\frac{1}{2}$, born without Hands and Feet at Anspach, 1674, the 3 Jan.

The Rev. John Wesley, the founder of Methodism, had an eye for anything out-of-the-way, and his letters and journals are full of curious facts on many subjects. A correspondent named Walton wrote to him under date October 14, 1788, and gave details of an interview with a man named William Kingston, born at Ditcheat, near Bristol. 'I went with a friend,' says Walton, 'to visit this man, who highly entertained us at breakfast by putting his half-naked foot upon the table as he sat, and carrying his tea and toast between his great and second toe to his mouth, with as much facility as if his foot had been a hand and his toes fingers. I put half a sheet of paper upon the floor, with a pen and inkhorn : he threw off his shoes as he sat, took the inkhorn in the toes of his left foot, and held the pen in those of his right. He then wrote three lines, as well as most ordinary writers, and as swiftly. He writes out all his own bills and other accounts. He then showed how he shaves himself with a razor in his toes, and how he combs his own hair. He can dress and undress himself, except buttoning his clothes. He feeds himself, and can bring both his meat and his broth to his mouth by holding the fork and spoon in his toes. He cleans his own shoes ; can clean the knives, light the fire, and do almost every other domestic business as well as any other man. He can make hencoops. He is a farmer by occupation. He can milk his own cows with his toes, and cut his

own hay, bind it in bundles, and carry it about the field for his cattle. Last winter he had eight heifers constantly to fodder. The last summer he made all his own hayricks. He can do all the business of the hayfield (except mowing) as fast and as well, with only his feet, as others can with rakes and forks. He goes to the fields and catches his horse ; he saddles and bridles him with his feet and toes. If he has a sheep among his flock that ails, he can separate it from the rest, drive it into a corner, and catch it when nobody else can. He then examines it, and applies a remedy to it. He is so strong in his teeth that he can lift ten pecks of beans with them. He can throw a great sledge-hammer as far with his feet as other men can with their hands.' Mr Wesley's correspondent concluded his letter by observing that Kingston could almost do as much without as others could with their arms.

We find a record of the marriage of an armless woman in the parish register of St James's Church, Bury St Edmunds. It is stated on the 5th November 1832, 'Christopher Newsam married Charity Morrell. Charity Morrell being entirely without arms, the ring was placed upon the fourth toe of the left foot, and she wrote her name in this register with her right foot.'

Miss Biffin was one of the most celebrated of this class of people, and in her earlier years was one of the popular sights of the large English fairs. She sewed with her toes, cut out paper patterns and performed other ingenious feats with her toes. She was also an artist. This pretty and talented woman was seen at Bartholomew fair by the Earl of Morton, and she so pleased him, that he took a deep interest in her welfare. She painted portraits, the pencil and brush being attached to her shoulder. The earl sat for his likeness, which he took away after each sitting, so that he might be able to prove it was the work of only Miss Biffin. The painting was a successful one ; and in the year 1808 he brought it under the notice of George III., who was so much pleased with the skill displayed under disadvantages, that at his own expense he engaged Mr Craig the artist to give her lessons in art. George IV. also patronised Miss Biffin ; and from William IV. she enjoyed a small pension ; whereupon, at the desire of the earl, she retired from life amongst the shows. He was a firm friend, and for twenty years corresponded with her. After fourteen years' retirement, she reappeared as Mrs Wright, a skilful miniature painter, in one or two of the larger provincial towns. She died at Liverpool in 1850, and was buried in St James's Cemetery ; her grave-stone bearing the following inscription : 'Reader, pause. Deposited beneath are the remains of SARAH BIFFIN, who was born without Hands or Arms, at East Quantox Head, county of Somerset, 25th October 1784 ; died at Liverpool 2d October 1850. Few have passed through the vale of life so much the child of hapless fortune as the deceased, and yet possessed of Mental Endowments of no ordinary kind. Gifted with singular talents as an artist, thousands have been gratified with the able productions of her pencil, while her versatile conversation and agreeable manners elicited the admiration of all. This tribute to the memory of one so universally known is paid by those who were best acquainted with the

character it so briefly portrays,' &c. Several portraits of Miss Biffin have been engraved, and one is given in the *Memoirs of Bartholomew Fair* by Henry Morley.

PARSON JIM.

A WESTERN SKETCH.

THE express trains of that monument of engineering skill, the Denver and Rio Grande Railway, now daily traverse the extreme eastern portion of the Rocky Mountains, lying between the city of Denver on the north and Pueblo on the south; and summer tourists, as well as all-the-year-round men of business, pass over the picturesque road by hundreds and by thousands in the course of a single year. There was a time, however—not very long since, either—when white men were very scarce in that section, and when the only means of locomotion was a much dilapidated Concord Coach, whose trips were alleged to be *weekly*, though, as a matter of fact, the time-schedule of said coach was practically filled out to suit the driver, as he, with much 'cussing' and little speed, carried Uncle Sam's mails from stage to stage.

Rather more than twenty years ago, there was, about midway between Denver and Colorado Springs, a point on the road where the broad valley narrowed into a deep and wild gorge, known as the George Washington Gulch. The gorge is there yet, I presume, but the name has apparently disappeared, there being no such station on the railway, nor, so far as I can discover, such a place on the revised maps of Colorado. But in those old days, George Washington Gulch was a relay station of the Denver stage line. Leaving Indians out of the question, they being of a ubiquitous nature, the resident population of the Gulch numbered three souls, all told, while a census would have revealed the fact that these all occupied the same dwelling-house. There was in those times no town or settlement of any account between Denver and the Springs, so that the Stage Company was compelled to establish a number of stations at perfectly wild and unpopulated points, to properly effect changes of horses. So a rough shed had been erected in the Gulch to do duty as a barn for the accommodation of the four horses usually to be found there; while adjoining was a frame mansion, consisting of one apartment, which served as sleeping-room, parlour, dining-hall, and kitchen for the three inhabitants, as well as being the official headquarters of the Honourable Samuel Green, who, in addition to his position as agent of the Stage Company, held a postmaster's commission from the President of the United States.

The Honourable—be it remembered that Mr Green was a government official, though no post-office business had ever passed through his hands, not even a letter from or to himself, unless we count those which had to do with the stage business and went 'dead-head'—the Honourable Samuel Green's companions in the solitude of the Gulch were a negro named Ananias—doubtless from his propensity for prevarication—who was chief groom of the stables; and a half-breed Indian, whose main occupation was to trap and shoot game and then cook it. This latter indi-

vidual was known as Francis Murphy, and his chief failing was a fondness for undiluted whisky.

At the close of a fair summer day, the Honourable Samuel Green, with Messrs Murphy and Ananias, sat together on a bench placed along the front of their residence. The two last-named gentlemen were still enough to justify one in the supposition that they must be sleeping; but the Honourable Samuel was busily engaged in rapping and rubbing two or three little pieces of rock which lay in the palm of one of his hands. He was evidently much interested.

'Nias!' said he at last.

'Sah?' responded the woolly-headed darkey, rubbing his heavy eyes.

'I'm a-goin' through to Denver with Bill to-morrow.' (Bill was one of the drivers on the stage line; the other was Si—abbreviated from Silas.) The postmaster continued: 'You an' Francis Murphy keep awake part o' the time, an' sorter watch things while I'm gone.—Do yer ketch on?'

'Yes, in course, sah.'

Four days later, the Honourable Samuel Green returned to the Gulch from Denver, and brought with him a regular mining kit—picks, mattocks, hammers, shovels, blasting-powder, and other useful articles.

Two weeks passed, and again the postmaster of George Washington Gulch 'went through with Bill'—this time loaded down with samples of rich silver ore.

By the following spring the Gulch was alive with a population of over three hundred white men and three women—not counting Indians and Chinese. George Washington Gulch contained a rich vein of silver—enough to make it a scene of much activity for five whole years.

About a year after the postmaster's important trip to Denver, George Washington Gulch was floating bravely on a floodtide of wealth and prosperity. The Honourable Samuel Green actually had considerable postal business to transact, besides which, a double coach-service had to be put on the road, while Gulch passengers arrived or departed with every coach. Add to this the fact that the postmaster owned an interest in the richest claim in George Washington Gulch, and it will be readily understood that he had developed into an individual of considerable importance.

Still, if one had about that time quietly investigated among the strange characters who formed the curiously cosmopolitan population of that Colorado valley, with a view to learning who among their number was held in the highest esteem, the Honourable Samuel's name would scarcely have received mention. The parson was the favourite among 'the boys;' and hardly a man but would gladly have given his last dollar, ay, or his life's-blood, had anything so serious been necessary, to help the parson out of a tight place. Never let it be imagined for a moment that the parson of the Gulch was the orthodox pastor, in the habit of wearing broad-cloth of clerical cut and white cravats. He wore a broad-brimmed hat, certainly, but it was of the approved cowboy pattern; to a coat he was well-nigh a stranger, being content to appear in a heavy red woollen shirt; while for trousers

he substituted the highly ornamented and picturesque buckskin breeches affected by Mexicans, Indians, and other denizens of the Far West. It is also certain that the title of Reverend had never been, verbally or in writing, prefixed to his name; and yet he knew, and the boys knew, that to be called 'Parson Jim' was in itself a mark of distinction in a district where men were supposed to have no official titles or surnames, while Christian names were invariably reduced to monosyllables.

Parson Jim's record and capabilities were hardly such as would recommend him as a candidate for church-work in communities laying claim to advanced civilisation. He could not read the Pentateuch in the original Hebrew, or discuss the Thirty-nine Articles; but he was a dead-shot with a revolver, and could gracefully ride the back of a bucking broncho. The Westminster Catechism was a sealed book to Parson Jim; but he could set a broken limb, raise a tent, or build a shanty with the next man. And because he was cool as ice when fiery blood coursed through the veins of other men—because he was brave as a lion—because he was gentle as a woman with sick men—because he had a big heart—because he spoke kindly words—and because nothing came amiss to Parson Jim, the rough specimens of humanity in George Washington Gulch loved and respected him as they never could have loved and respected a grave and learned Doctor of Divinity from the East.

Now, in a Western mining town it is a gross breach of etiquette to make inquiries as to a man's pedigree, or to attempt to learn more than he chooses to tell of his history prior to his arrival in the camp. So long as he is 'square' and behaves himself, he is one of 'the boys,' and as such is bound to them by a sort of freemasonry. Hence, when Parson Jim came to the Gulch and announced himself as a preacher, the miners asked no questions. They did not take 'much stock' in preaching, but they were disposed to give the newcomer a 'show;' and when time passed, and Parson Jim proved to their satisfaction that he was made of the right 'stuff,' they not only tolerated him, but made him heartily welcome.

There was no church in the Gulch; there was no schoolhouse; there was not even a hall of any kind. There was, however, a large frame shanty used for a whisky saloon, named by its proprietor 'The Rocky Mountain Sample Rooms.' In the West, be it remembered, all the drinks are samples, no matter if the same consumer gets away with fifty glasses from the same barrel.

Parson Jim made his appearance in the Gulch during the winter immediately following the summer when the Honourable Samuel Green made his important discovery of the existence of silver in the valley. He arrived on a handsome roan mare, without bag or baggage, and made his quarters at the rude hotel connected with the Rocky Mountain Sample Rooms. During the evening, there was a scuffle in the large bar-room, and the newcomer looked in through one of the doors to see what was the trouble. A young and slender lad of perhaps nineteen or twenty years was struggling with a brutal-looking, muscular giant of twice his age. It was only a question of minutes when the big rough fellow would 'down'

his young opponent, and yet the dozen or so of onlookers made no attempt at interference. Just as the new arrival appeared on the scene, the younger combatant got in a nasty blow, which evidently hurt and irritated his opponent. Quick as lightning, the big fellow drew his bowie-knife and raised it, preparatory to plunging it into the lad.

'Hands off, you bully!' shouted the stranger in the doorway. The burly fighter glanced rapidly in the direction from whence these words came, but did not drop the hand which gripped the ugly knife.

'Drop that knife!' thundered the stranger, at the same time laying his hand upon his pistol-pocket.

The bully noticed the last-named action, and letting go the boy, yelled, with added oaths: 'Curse you, shut up! Who are you, anyhow?' The large man was evidently very angry. He held the knife in his left hand, and with his right drew a heavy revolver, which he proceeded to level at the stranger.

'Throw up your hands, quick!' shouted the latter. But the fellow did not hear this warning. Click! went the hammers of the pistols. It was a question of quarter-seconds now. Bang! went one revolver—the stranger's—and the big man fell—dead.

Then there was a momentary silence, followed by some queer ejaculations: 'Dead as a Injin!'—'Served him right!'—'Stranger's a plucky un!'—'Be-ewtiful shot!'—'Who air you, stranger, anyhow?'

'Boys,' said the new arrival, when at last he had a chance to speak, 'this is a sort of business that I am not fond of. Sometimes it is necessary, though, as it was to-night. I am sorry; but let's say no more about it. I pay the funeral expenses and answer all questions.—You want to know who I am? Well, I'm a preacher; and there'll be preaching in this room, with the landlord's permission, next Sunday morning at ten o'clock.'

It was a strange introduction for a preacher, but it was perhaps the best one he could have had in that wild place. Anyway, the respect of those rough miners was lastingly secured, and from that time on he grew in favour as a man and a preacher.

In those old coach-days there was one serious drawback to travelling between Denver and George Washington Gulch—the road was infested by a small but hitherto invincible band of desperadoes, under the leadership of a regular dare-devil known as 'Kansas.' This man Kansas had attacked and robbed the coaches fifteen or eighteen times within six months; and though he had never been known to be accompanied by more than three confederates, his band was the terror of the stage-drivers and their passengers. Once the proprietors of the stage line had organised a posse of armed men, who scoured the country in search of Kansas and his crew; but the outlaw remained at large, and within a week lightened a coach of seven thousand dollars-worth of silver ingots.

Late in the evening of a summer day, when, with the exception of a party of gamblers at the 'Sample Rooms,' all the citizens of the Gulch

were soundly sleeping, a solitary horseman rode up to the unpretentious shanty which did duty for a parsonage. It was nothing but a two-roomed hut, rudely constructed and roughly furnished. On this occasion the 'parsonage' was in sole charge of Ah Wing, a 'heathen Chinese,' who acted as Parson Jim's cook and chambermaid. Ah Wing was himself perchance in some Chinaman's paradise, for his sleepy features, usually utterly void of expression, were illumined by a yellow smile. The parson was off, as he frequently was, on a trip down the valley, and the parsonage, being well removed from the main portion of the settlement, was seldom visited during his absence. The dreaming Celestial was therefore much surprised, and indeed frightened, when he was awakened from his slumber by a violent hammering at the barred door. He cautiously drew back the wooden bolt, and peered out into the warm, starlit night. Close to the door he beheld a stalwart man with long black hair and a heavy moustache, holding in one hand the bridle of a large horse, while on his left arm he carried a girl—evidently dead or in a fainting condition.

'Where is the parson?' asked the stranger in a firm but quiet voice.

'Parson Jim he go way muchee; he no come home till Slunday,' replied the surprised Chinaman.

'Well, hold my horse, and hold him tight. This young woman is very sick, and I'm going to lay her on the parson's bed.'

He entered the room, and tenderly laid his burden on the camp cot which Parson Jim used for a bed. Then he tore a fly-leaf from an old book which he saw lying around, and producing a short end of a pencil from his pocket, wrote hastily and somewhat clumsily a few words.

'See here,' he said to the Chinaman, as he stepped to the door; 'give this piece of paper to the parson as soon as he returns. This young lady is hurt a little, and frightened a great deal, and she has fainted. Pretty soon she will come around. When she does, see that you take good care of her, you yellow-skinned, white-livered duck! Perhaps you'll behave yourself all the better if I tell you my name is Kansas!'

The Chinaman perceptibly trembled as he heard the dreaded name, but said nothing, and the handsome stranger sprang to his horse and rode away.

Ah Wing quietly surveyed his new charge, and saw that she was a yellow-haired, fair-complexioned girl of perhaps fifteen or sixteen years, slender, and evidently unused to work of any kind. The Chinaman faithfully kept watch all night, and noticed that the girl passed gradually from her faint into an easy slumber.

It was six o'clock in the morning, and the girl was still sleeping, when Parson Jim returned. Ah Wing felt much relieved, and at once handed the note to his master. It was written in a rough, unknown hand, but this is what he managed to decipher:

PARSON—You are understood to be a pretty good fellow. This girl's father was accidentally shot this evening in a scuffle with the coachpeople. She must be cared for; and I select you for the job. I know your record, and you

are the only man in Colorado I would trust with an unprotected girl. I will see that you are supplied from time to time with money for her keep.—Be true to this trust, or look out for
KANSAS.

The parson twirled the paper in his fingers, shoved it into his hip-pocket, and then asked a few questions of Ah Wing.

'What kind of a fellow brought the girl here?'

'Muchee fine Melican man,' replied the little Chinaman.

'Would you know him again if you saw him, Ah Wing?'

'Yes, siree; Ah Wing no fool.'

Half an hour later, the fair young stranger opened her eyes, and the parson, in his homely but pleasant way, proceeded to make her feel at home.

'I am afraid, miss, that you have just passed through serious trouble; but try and feel that you are at least safe and among friends. You are welcome to all this poor house affords, and anything we can do for you shall be done.'

But the girl burst into a flood of tears, and could speak no words but 'Poor father—poor father!'

Later on, Parson Jim learned that she and her father were the only passengers on the preceding day from Denver, and that they were going through to Colorado Springs on their way to New Orleans. The coach was attacked by highwaymen, and as the girl's father, Mr Winship, rather unwisely resisted them, he was shot dead. Then the girl had fainted, and remembered nothing until she found herself in Parson Jim's best room. Her name, she said, was Ethel Winship.

Putting the girl's story and the contents of the note together, it looked as though the desperado Kansas had killed the girl's father, and prompted by some feelings of remorse and pity, had undertaken to help the bereaved daughter.

A day or two later, when Ethel was somewhat rested and her grief less poignant, Parson Jim had another talk with her.

'What would you like to do?' he said.

'O sir, there is nothing for me to do. Get me work of some kind here in this place. We had no friends—father and I had lived and travelled together since my mother died, many years ago. We were getting poor, too, I know, and my father had some plans of his own, but what they were, I do not know. If you will help me to get a living here, I shall be much obliged, and I am willing to try anything.'

'My poor child,' said Parson Jim in his kindly voice, 'I am truly sorry for you. If you can be content in my rough home for a while, stay here until we can manage something better for you. I have no one for whom I care, or who cares for me—only the boys in the camp. But those same boys will tell you that not a hair of your head will be hurt while you stay under my roof. I have plenty of this world's wealth—more than the boys imagine—and I can afford a slight addition to my family.'

So she stayed, and found that Parson Jim's words were true. She could not have been treated more as a lady had she been an earl's

daughter and the guest of a dowager-duchess. As the weeks passed, Parson Jim managed to add a couple of cute little rooms to the parsonage, one of which was 'my lady's chamber,' and the other the 'parlour.' Then, too, pretty carpets and furniture came from Denver, and the boys began to think that the parson was putting on 'lugs.' But they excused a good deal in the parson, and really vied with one another in paying homage in their rough way to the parson's ward.

Of course they soon knew the story; and Parson Jim had shown the Honourable Samuel Green and one or two others the note that Kansas had left with Ethel Winship.

Months fled, and Ethel stayed on at the Gulch. She became contented, and much appreciated the parson's care and efforts to make her comfortable. She showed her gratitude in a hundred womanly ways, and kept the parsonage as neat and pretty as if it had been in Massachusetts or the English Midlands, instead of in a wild Colorado valley. Only, every time news came of a robbery or murder by Kansas and his gang, would the poor girl become agitated, and cry for vengeance on the man who took from her a dear father.

Three years slipped quickly away at George Washington Gulch. The robber had evidently not forgotten his promise to provide for the girl; for, at odd times, a packet of money had been found on the outside of the parson's window-sill, marked 'From Kansas.' It had always been placed there overnight, in a mysterious manner; for no one was ever seen to do it. Parson Jim himself still preached every Sunday in the Sample Rooms, and was still a prime favourite with the miners, though they sometimes wondered why a man who was evidently so well 'fixed' as the parson should elect to stay in a rough, out-of-the-way place like the Gulch.

Ethel Winship had grown into a beautiful woman, and was good as she was pretty. Parson Jim perceived this. Parson Jim was in love with his ward.

One evening in the spring-time, he told Ethel of his love, and asked her to be his wife.

'I cannot answer that question, dear Jim,' said the girl. 'Myself is the only reward which I can offer to any man, because I have naught else. So I have long ago made up my mind to keep myself to offer, if needs be, as a reward to the man who shall kill or capture Kansas. If it were not for that firm resolve, I would say "Yes" at once—for, Jim, you deserve my love and all I can give you. But do not ask me, dear. Perhaps Kansas will be captured, anyhow—and soon—by some one who will never think of reward. Then—well, don't think badly of me, Jim, dear: two things would make me a happy girl—vengeance on Kansas, and the right to call you my husband.'

Parson Jim heard these words sadly enough; but he thought too much of Ethel and her resolves to seek hastily to turn her from her purpose even for his own benefit.

Early in the following summer, towards sunset, Ethel sat on the porch of the parsonage quite alone. The parson was away, and had been away all day, and might not return until the following evening. One of the men from the Gulch approached and doffed his hat.

'Parson in, miss?'

'No, Zeke; he is away to-day.'

'Well, I wuz jest a-goin' ter tell him that we've got news that Kansas is likely ter be up ter mischief 'way about ten miles along ther valley ter-night. It's the first time we e'er got a pointer as ter Kansas's tricks, an' some uv us thought as like enuff we might make up a little crowd to down his nobbs. Parson's mostly game fer bizness that's right an' squar, so I kim up ter tell him.'

Ethel's eyes flashed, and the warm blood coursed quickly through her veins, as a wild thought occurred to her. She could ride like an Indian, and she was a dead shot; Parson Jim had taken a special delight in making her a good horsewoman and clever with a pistol.

'I will go,' she said. 'I'm not going to ask if I may go; I'm going, Zeke.'

'All right, miss; only it's risky work, an' not fit fer ladies. Mebbe ther parson wouldn't like fer yer ter go?'

'Yes, he would, Zeke—yes, he would.—Don't you know—don't you remember all about my poor father? I will go; and if I get within range of Kansas, I will shoot him without mercy.'

So Ethel joined the party of fifteen or twenty armed men who rode out that night for the purpose of capturing, if possible, Kansas and his desperadoes. They rode in as wide a line as the valley would permit, so that no company of horsemen might pass them unnoticed, and this plan proved a good one. About ten o'clock at night they espied four horsemen, evidently awaiting the coach, and closed in upon them. Zeke insisted on keeping Ethel Winship back, and made her promise to stay with him if the boys could effect a quick capture. But, no; the outlaws knew that certain death awaited them should they be captured, and resolved to fight dearly for their lives. There was a sharp, quick interchange of pistol-shots. Three of the robbers and three of their pursuers fell from their saddles. The fourth desperado put spurs to his horse and dashed right through the crowd of miners, who, in their surprise at his action, allowed him to pass. The desperate man emptied all the charges of his revolver behind him, as he galloped, threw the pistol down, and drew another from his belt. He rode in the direction of Ethel and Zeke, and they could see that he was a magnificent man, with long black hair and a black moustache.

'Kansas!' muttered Zeke.

Ethel no sooner heard that detested name, than she levelled a revolver at the man riding rapidly past. It required a steady arm and a sure eye to hit such a mark; but she did it. Click—bang—and a bullet lodged in the brain of the highwayman. A dozen men rode up and lifted the man. He was dead.

They laid him back on the ground, and one of the men, more curious than the rest, proceeded to examine the wound in his temple. To do so, he brushed back the long black hair, and discovered that it was false. Then he looked closely at the heavy moustache: that also was false; so he pulled both wig and moustache from the dead man. As he did so, a long and piercing scream rent the air, and Ethel Winship threw herself upon the corpse of the highwayman.

'O my God! my poor Jim!—my poor Jim! I have murdered you!' And then she fainted.

'Parson Jim!' almost whispered a dozen men.

One of the slightly wounded ruffians who also stood near, between two of his captors, nodded his head and said: 'Yes, Parson Jim. He fooled you boys badly. We call him Kansas!'

When they lifted the girl from the dead body of Parson Jim, or Kansas—Ethel Winship's lover and the slayer of her father—she, too, was dead. Kansas was punished, and Ethel's father was avenged.

HOCKTIDE IN BERKSHIRE.

HUNGERFORD, a small but pretty town at the extreme west end of the royal county of Berks, is one of the few places in England as yet untouched by municipal reform, and the manner in which town matters are carried on remains the same as when it received its charter with various rights of pasture, shooting, and fishing from John of Gaunt in 1362. The constitution of the governing body is as follows: 'High-constable,' feofees, portreeve, bailiff, tithing-men, and the Hocktide jury. No one can serve the office of high-constable until he has served the offices of tithing-man, bailiff, and portreeve. All who have filled these offices are eligible, and the Hocktide jury have the power to elect. The high-constable is during his term of office lord of the manor, and likewise coroner for the borough, and no town business can be settled without his sanction. The bailiff has to collect all market and other tolls; and the portreeve has to gather in all quit-rents, the same to be handed to the high-constable.

The 'tithing-men,' or in common speech, 'tuttimen,' are selected from the tradesmen of the town; and their duties are somewhat unique. Before the establishment of the county police, they had to act as constables, and assist in preserving order in the town. In addition to this, 'on Hockney Day'—which is the Tuesday following the Easter week—they have to visit each house in the borough and demand a coin of the realm from each male; and have the privilege of taking, if not freely given, a kiss from each female. As a rule, the ladies take the salute in good part, as the writer of this can testify, having served the office. Some are coy and run away, but generally allow themselves to be caught. The said tithing-men carry each a staff about six feet long, bedecked with choice flowers, and having streamers of blue ribbon; the whole being surmounted with a cup and spike bearing an orange, which is given with each salute, and then replaced by another one.

The proceedings of Hocktide are of a very festive character, and begin on the Friday preceding 'Hockney Day' by the holding of what is called the 'Audit Supper' at the *John o' Gaunt* inn. The guests on this occasion are those who bear office in the town. The fare is macaroni, Welsh-rabbits, and watercress, followed by steaming hot punch.

The following Tuesday, Hockney Day is ushered in by the blowing John of Gaunt's horn from the balcony of the town-hall. At nine o'clock, the Hocktide jury having been summoned, assemble in the town-hall; and having chosen a foreman

and being duly sworn, the ancient rules and regulations of the court are read over by the town-clerk; after which the names of the free suitors and commoners are called over; those who do not answer to their names have to pay a penny, or lose their right of commons and fishing for the ensuing year. The high-constable then presents his accounts; the vouchers of expenditure are passed to and examined by each jurymen; and if these be found correct, the jury attach their signatures to the balance sheet. This being done, the high-constable for the ensuing year is chosen, and the other officers are also elected. In addition to those already named, are three water-bailiffs, three overseers of the port downs, three keepers of the keys of the common coffer, two ale-tasters, hayward, hall-keeper, and bellman. Presentments as to encroachments (if any) on the town property are made and discussed, and any matter relating to the welfare of the town considered.

The business concluded, the retiring high-constable invites the jury to luncheon at the *Three Swans' Hotel*. A substantial cold collation is provided, followed by bowls of punch.

On the following Friday morning, the officers are sworn in; and in the evening, the newly elected high-constable gives a banquet to his fellow-townsmen to the number of from sixty to eighty. The banquet is a right royal one, there being everything in season, and a profusion of the choicest wines. On Saturday, the festivities are brought to a close by luncheon at the *Three Swans' Hotel*, again followed by punch *ad libitum*. The whole of the Hocktide proceedings come to an end on Sunday, when the high-constable and corporation meet in the town-hall and walk in procession to the parish church to attend divine service.

Last year, Hocktide was carried out in the most orthodox manner, the high-constable, Mr John Platt, jun., having been elected for the seventh consecutive year. From the foregoing, it will be seen that the Hungerfordians combine business with pleasure in the most agreeable fashion.

LUX IN TENEBRIS.

Lost, and within a scattered forest straying,
The soft, green vaulting of columnar trees
Above me, and the haze of sunset spraying
The nested songsters at their evening glees,

I seek all vainly for the sun to guide me
West towards his chamber through the darkening
grove;
But glimmering mists conceal him, though beside me
The air is clear, screened by the boughs above.

When lo! upon the mouldering greensward lying
Dim, ghost-like shadows front each gnarled tree,
Which tell me where the lord of day is dying:
So darkness points to light I cannot see.

My soul, of late in drearier depths repining,
The emblem takes, and hopes for liberty:
Let Doubt become a vassal to thy shining,
And lead my wandering steps, O Truth, to thee!

MR FROUDE ON THE WEST INDIES.

IT is now nearly four hundred years since the intrepid Columbus first sighted the lands of the New World. His last glimpse of the Old World had been on the 9th of September 1492, when, after some days of calm, a breeze sprung up, and the westmost of the Canary Islands was left behind, gradually fading out of sight on the after-horizon. For more than a month, land was not again seen. The clear faith of the explorer in that western continent which lay somewhere beyond the broad Atlantic, never failed him; but the hearts of his sailors sank day by day, overawed as they were by the mystery and fear of thus plunging uninvited into unknown and inhospitable seas. Doubt and mutiny prevailed around him, and only by ingenious devices and large promises did Columbus overcome the terrors of his wavering crews. At length their hearts were cheered by the sight of floating weeds, of swarms of land-birds flying away in a south-westerly direction, of stray branches of trees with their red fruit still upon them. All these were hailed as so many indications that the strange land they sought was not far off. Often at close of day, a bank of clouds on the western horizon would be hailed with delight as the first rising peaks of a new world, and as often as the dawn of morning came would the joyful vision be dispelled in air. About ten o'clock of the night of October 11, Columbus himself, stationed on the high poop of his vessel, saw what he took to be a light in the distance; but it was not till morning dawned that the presence of land was placed beyond doubt. There indeed before him was the bright green island which he afterwards named San Salvador, one of the Bahamas, and of which he took immediate possession. With this event began a new chapter in the world's history.

During the four hundred years which have since elapsed, the long sweep of islands now known as the West Indies, or Antilles, have filled a large place in human annals. From them, as from a living centre, other arms of dis-

covery were thrust out, until at last the vast continent of America, North and South, was unveiled to the gaze of Europe. The Spanish nation, a great power in the fifteenth century, however insignificant in this present, set up in these western islands the beginnings of a new civilisation, before which the peaceful and soft-eyed natives of the Bahamas and the fierce and man-eating Caribs of Hayti were alike doomed to cruel and sanguinary extermination. The footprints of the Spaniards throughout those islands were everywhere marked with blood; the first gift of the Old World to the New was fire and a sword. Nor was Spain left to work her cruel will unmolested; for France was jealous of her power, and the brave-hearted Drakes and Raleighs of Elizabeth and James carried the English flag into the very heart of the Spanish settlements. For two centuries these three powers from time to time renewed the fight over their western possessions, till now these gems of the ocean are owned in part by all the three.

But while the Spaniards and their allies succeeded in exterminating the dark races which inhabited those islands at the time of their discovery, it is the black man and not the white that forms the great bulk of the population still. How has this been brought about? It is a painful story, and England has had her share in the disgrace. When the original natives of the Antilles had been killed out, the dominant Europeans found that the white man, by reason of his whiteness and physical constitution, was not qualified for the work of cultivating those islands with their tropical heat and glare. Vessels were therefore sent to the west coast of Africa, and there shipload after shipload of the natives were captured and kidnapped, being thrust in scores into close and suffocating holds, and thus borne across the Atlantic to cultivate in slavery the fertile lands of the New World. It is thus that the high-browed, beautiful-eyed, copper-coloured aborigines of the West Indies have been replaced by the black skin, the squat features, the woolly head of the negro. For generations the

negroes suffered and served as slaves, treated by some masters with kindness, by others with cruelty; until at length, in the fullness of enlightened public opinion, these slaves were declared to be free. But their freedom did not induce them to return to the Africa of their origin, for in the meantime they had learned a new language and been bred into a different civilisation; and so the irony of fate has brought it about, that in the rich lands whither these negroes were transhipped as slaves, they are henceforward apparently to become the masters. Everywhere the white man retreats and the black man takes possession, and soon, by all indications, these jewels of the western seas—the beautiful islands for which England and France and Spain have spent against each other such untold quantities of blood and treasure—will be the birthright of the swarthy children of Ham. If any one has a doubt about this result, he must read Mr Froude's latest volume.*

It is almost superfluous to say that Mr Froude's book on the English in the West Indies is an eminently readable one. All Mr Froude's books are so. This one is marked by the well-known characteristics of his vigorous and graceful literary style, and contains passages of marvellously beautiful description. With the politics of the book we will not intermeddle; we only wish to learn what so keen and large-minded an observer has to tell us of the historic archipelago of the western seas.

When Mr Froude left England on the 30th December 1886, the land was covered with snow; and when the anchor was dropped in the roadstead at Bridgetown, on January 12, at sunrise, there lay before the voyagers the island of Barbadoes, shining in the haze of a hot summer morning. So easily nowadays does science baffle nature, and so readily could man, if he so choose, have a perpetual summer round the globe. Barbadoes, the writer tells us, 'is about the size of the Isle of Wight, cultivated so far as eye could see with the completeness of a garden; no mountains in it, scarcely even high hills, but a surface pleasantly undulating, the prevailing colour a vivid green from the cane fields; houses in town and country white from the coral rock of which they are built, but the glare from them relieved by heavy clumps of trees. You could see at a glance that the island was as thickly peopled as an anthill. Not an inch of soil seemed to be allowed to run to waste. Two hundred thousand is, I believe, the present number of Barbadians, of whom nine-tenths are blacks.' Labour is abundant and cheap. Almost the whole of the land is still held by the whites in large estates, cultivated by black labourers on the old system, and cultivated most admirably. 'If the West Indies are going to ruin, Barbadoes, at anyrate, is being ruined with a smiling face.' The language of the Anglo-Barbadians is pure English, the voices without the smallest transatlantic intonation. 'On no one of our foreign possessions is the print of England's foot more strongly impressed than on Barbadoes. It has been ours for two centuries and three-quarters,

and was organised from the first on English traditional lines, with its constitution, its parishes and parish churches and churchwardens, and schools and parsons, all on the old model; which the unprogressive inhabitants have been wise enough to leave undisturbed.'

But there is a worm at the root of Barbadian prosperity. This is the absenteeism of its land-owners. In Barbadoes, as throughout the West Indies, sugar was the staple production, and so long as it was unopposed in the markets, did well. But the introduction of beetroot in the European markets, and the bounties on beetroot sugar by certain European governments, have changed the old conditions, and the Barbadian sugar interest, Mr Froude was told, had gone over a precipice. This untoward state of things is aggravated by the fact that the land has been 'owned during the present century by gentlemen who for the most part lived in England on the profits of their properties, and left them to be managed by agents and attorneys. The method of management was expensive. Their own habits were expensive. Their incomes, to which they had lived up, had been cut short lately by a series of bad seasons. Money had been borrowed at high interest year after year to keep the estates and their owners going. The unencumbered resident proprietors could barely keep their heads above water. There was impending a general bankruptcy, which might break up entirely the present system, and leave the negroes for a time without the wages which were the sole dependence.' This description we shall find repeated substantially of most of the other islands in the British possession, with the same dismal outlook, the same sinking note of despondency.

Yet when one enters the streets of Bridgetown, there is no sign either of impending calamity or of present want. The houses are substantial; the public buildings solid and handsome, nowhere out of repair. 'The market square would have been well enough but for a statue of Lord Nelson which stands there, very like, but small and insignificant, and for some extraordinary reason they have painted it a bright pea-green.' Walking in the heat not being a thing to be thought of, 'I sat for two hours in a balcony watching the people, who were thick as bees in swarming-time. Nine-tenths of them were pure black; you rarely saw a white face, but still less would you see a discontented one, imperturbable good-humour and self-satisfaction being written on the features of every one. The women struck one especially. They were smartly dressed in white calico, scrupulously clean, and tricked out with ribands and feathers; but their figures were so good, and they carried themselves so well and gracefully, that although they might make themselves absurd they could not look vulgar. Like the Greek and Etruscan women, they are trained from childhood to carry heavy weights on their heads. They are thus perfectly upright, and plant their feet firmly and naturally on the ground. They might serve for sculptors' models, and are well aware of it. There were no signs of poverty. Old and young seemed well fed. Some had brought in baskets of fruit, bananas, oranges, pine-apples, and sticks of sugar-cane; others had yams and sweet potatoes from their bits of garden in the country. The men were active enough driving carts, wheeling

By James Anthony Froude. London: Longmans, Green,
& Co. 1888.

barrows, or selling flying-fish, which are caught off the island in shoals and are cheaper than herrings in Yarmouth. They chattered like a flock of jackdaws, but there was no quarrelling; not a drunken man was to be seen, and all was merriment and good humour. My poor down-trodden black brothers and sisters, so far as I could judge from this first introduction, looked to me a very fortunate class of fellow-creatures.'

But it is the old story. The children and servants revel in plenty and grumble about niceties, while the master of the house lies sleepless at midnight, knowing that burdens are accumulating which he cannot remove, and that all his surroundings of apparent wealth and abundance are as a palace built upon thin ice. At the island of Grenada, Mr Froude saw the same thing, only the imminence of the coming evil was more accentuated. Everywhere there was the same splendid luxuriance of nature; but the works of man were crumbling under the touch of decay. Grenada has the best harbour in the West Indies; but now there was not a vessel in it, nor so much as a boatyard where a spar could be replaced or a broken rivet mended. 'Once there had been a line of wharves, but the piles had been eaten by worms, and the platforms had fallen through. Round us when we landed were unroofed warehouses, weed-choked court-yards, doors gone, and window-frames fallen in or out. Such a scene of desolation and desertion I never saw in my life save once, a few weeks later at Jamaica. An English lady with her children had come to the landing-place to meet my friends. They, too, were more like wandering ghosts than human beings with warm blood in them. All their thoughts were on going home—home out of so miserable an exile.'

Grenada has become an island of pure peasant proprietors. The settlers, who had once been a thriving and wealthy community, have melted away. Not more than six hundred English are left, and these were clearing out at their best speed. They had sold their estates for anything which they could get. The free blacks had bought them, and about eight thousand negro families, say forty thousand black souls in all, now share the soil between them. Each family lives independently, growing coffee and cocoa and oranges, and all are doing very well. The possession of property has brought a sense of its rights with it, and they are extremely litigious. As to the future of these people, Mr Froude speaks despondingly. If left entirely to themselves, they would, he says, in a generation or two relapse into savages. There were but two alternatives before not Grenada only, but all the English West Indies—either an English administration pure and simple like the East Indian, or a falling eventually into a state like that of Hayti, where no white man can own a yard of land. Whether these islands should all have—as certain of them have already—some form of constitutional government, or an East Indian one such as Mr Froude indicates, is a question in practical politics which we are not called upon to discuss.

Trinidad is the largest, after Jamaica, of the British West Indian islands, and 'the hottest absolutely after none of them.' Here Mr Froude found the insanitary state of Port of Spain very pronounced, it being left to the rain alone—and

happily there is abundance of it—to wash the refuse out of the streets. A kind of black vulture, called a Johnny Crow, assists the elements by acting as scavenger, and eating up the garbage thrown out in the lanes and highways. Here also the traveller suffered from the persistent attentions of the mosquitoes; and the Trinidad mosquitoes for bloodthirsty ferocity had a bad pre-eminence over the worst that he had ever met with elsewhere. 'I killed one,' he says, 'who was at work upon me, and examined him through a glass. Bewick, with the inspiration of genius, had drawn his exact likeness as the devil—a long black stroke for a body, a nick for a neck, horns on the head, and a beak for a mouth, spindle arms, and longer spindle legs, two pointed wings, and a tail. Line for line there the figure was before me which in the unforgettable tailpiece is driving the thief under the gallows, and I had a melancholy satisfaction in identifying him.' Otherwise, there was every provision to make life pass deliciously. Yet Mr Froude, reverting to the feeling of despondency with which he seems to regard everything human in the West Indies, says: 'Languidly charming as it all was, I could not help asking myself of what use such a possession could be either to England or to the English nation. We could not colonise it, could not cultivate it, could not draw a revenue from it. If it prospered commercially, the prosperity would be of French and Spaniards, mulattoes and blacks, but scarcely, if at all, of my own countrymen. For here, too, as elsewhere, they were growing poorer daily, and those who remained were looking forward to the day when they could be released. If it were not for the honour of the thing, as the Irishman said after being carried in a sedan-chair which had no bottom, we might have spared ourselves so unnecessary a conquest.'

But, he adds, 'beautiful it was beyond dispute. Before sunset a carriage took us round the savannah. Tropical human beings like tropical birds are fond of fine colours, especially black human beings, and the park was as brilliant as Kensington Gardens on a Sunday. At nightfall the scene became still more wonderful; air, grass, and trees being alight with fireflies, each as brilliant as an English glow-worm. The palm tree at our own gate stood like a ghostly sentinel clear against the starry sky, a single long dead frond hanging from below the coronet of leaves, and clashing against the stem as it was blown to and fro by the night-wind, while long-winged bats swept and whistled over our heads.'

Of Dominica, the account which Mr Froude gives is in keeping with that given of the other islands. 'England has done nothing, absolutely nothing, to introduce her own civilisation; and thus Dominica is English only in name. Not a black in the whole island would draw a trigger in defence of English authority, and, except the Crown officials, not half a dozen Europeans.' In Jamaica, things were not quite so pronouncedly bad, though still not encouraging. 'Sugar was down of course. The public debt had increased, and taxation was heavy. Many gentlemen in Jamaica were selling, or trying to sell, their estates and go out of it. On the other hand, expenses of government were being reduced, and the revenue showed a surplus. The fruit-trade with the United States was growing, and promised

to grow still further. American capitalists had come into the island, and were experimenting on various industries. The negroes were far less indolent than they were supposed to be; they were settling on the waste lands, acquiring property, growing yams and oranges, and harming no one; they had no grievance left; they knew it, and were perfectly contented.

There can be little doubt that there is much in the internal condition of our West Indian possessions to cause anxiety to the home Government. The questions arising out of this state of things are partly political, partly social and commercial. The white man in those islands is evidently being pressed out; and the condition of the blacks will perhaps depend upon whether or not a good substitute is found for sugar-growing, long the chief object of native labour. There may be much in Mr Froude's book with which those who are interested in the subject may disagree; there is in it, at the same time, much to attract public attention to the critical state and polity of our possessions in the Caribbean.

THIS MORTAL COIL.

CHAPTER X.—SHUFFLING IT OFF.

THE day had been an eventful one for Hugh Massinger: the most eventful and pregnant of his whole history. As long as he lived, he could never possibly forget it. It was indeed a critical turning-point for three separate lives—his own, and Elsie's, and Winifred Meysey's. For, as Hugh had walked that morning, stick in hand and orchid in buttonhole, down the rose-embowered lane in the Squire's grounds with Winifred, he had asked the frightened, blushing girl, in simple and straightforward language, without any preliminary, to become his wife. His shy fish was fairly hooked at last, he thought now: no need for daintily playing his catch any longer; it was but a question, as things stood, of reel and of landing-net. The father and mother, those important accessories, were pretty safe in their way too. He had sounded them both by unobtrusive methods, with dexterous plummets of oblique inquiry, and had gauged their profoundest depths of opinion with tolerable accuracy, as to settlements and other ante-nuptial precontracts of marriage. For what is the use of catching an heiress on your own rod, if your heiress's parents, upon whose testamentary disposition in the last resort her entire market value really depends, look askance with eyes of obvious disfavour upon your personal pretensions as their future son-in-law? Hugh Massinger was keen enough sportsman in his own line to make quite sure of his expected game before irrevocably committing himself to duck-shot cartridge. He was confident he knew his ground now; so, with a bold face and a modest assurance, he ventured, in a few plain and well-chosen words, to commend his suit, his hand, and his heart to Winifred Meysey's favourable attention.

It was a great sacrifice, and he felt it as such. He was positively throwing himself away upon Winifred. If he had followed his own crude inclinations alone, like a romantic schoolboy, he would have waited for ever and ever for his cousin Elsie. Elsie was indeed the one true love

of his youth. He had always loved her, and he would always love her. 'Twas foolish, perhaps, to indulge overmuch in these personal preferences, but after all it was very human; and Hugh acknowledged regretfully in his own heart that he was not entirely raised in that respect above the average level of human weaknesses. Still, a man, however humanesque, must not be governed by impulse alone. He must judge calmly, deliberately, impersonally, disinterestedly of his own future, and must act for the best in the longrun by the light of his own final and judicial opinion. Now, Winifred was without doubt a very exceptional and eligible chance for a briefless barrister: your sucking poet doesn't get such chances of an undisputed heiress every day of the week, you may take your affidavit. If he let her slip by on sentimental grounds, and waited for Elsie—poor, dear old Elsie—heaven only knew how long they might both have to wait for one another—and perhaps even then be finally disappointed. It was a foolish dream on Elsie's part; for, to say the truth, he himself had never seriously entertained it. The most merciful thing to Elsie herself would be to snap it short now, once for all, before things went further, and let her stand face to face with naked facts: ah, how hideously naked!—let her know she must either look out another husband somewhere for herself, or go on earning her own livelihood, in maiden meditation fancy free, for the remaining term of her natural existence. Hugh could never help ending up a subject, however unpleasant, even in his own mind, with a poetical tag: it was a trick of manner his soul had caught from the wonted peroration of his political leaders in the first editorial column of that exalted print, the *Morning Telephone*. So he made up his mind; and he proposed to Winifred.

The girl's heart gave a sudden bound, and the red blood flushed her somewhat pallid cheek with hasty roses as she listened to Hugh's graceful and easy avowal of the profound and unfeigned love that he proffered her. She thought of the poem Hugh had read her aloud in his sonorous tones the evening before—much virtue in a judiciously selected passage of poetry, well marked in delivery:

'He does not love me for my birth,
Nor for my lands so broad and fair:
He loves me for my own true worth,
And that is well,' said Lady Clare.

That was how Hugh Massinger loved her, she was quite sure. Had he not trembled and hesitated to ask her? Her bosom fluttered with a delicious fluttering; but she cast her eyes down, and answered nothing for a brief space. Then her heart gave her courage to look up once more, and to murmur back, in answer to his pleading look: 'Hugh, I love you.' And Hugh, carried away not ungracefully by the impulse of the moment, felt his own heart thrill responsive to hers in real earnest, and in utter temporary forgetfulness of poor betrayed and abandoned Elsie. They walked back to the Hall together next minute, whispering low, in the fool's paradise of first young love—a fool's paradise, indeed, for those two poor lovers, whose wooing set out under such evil auspices.

But when Hugh had left his landed prey at

the front door of the square-built manor-house, and strolled off by himself towards the village inn, the difficulty about Elsie for the first time began to stare him openly in the face in all its real and horrid magnitude. He would have to confess and to explain to Elsie. Worse still, for a man of his mettle and his sensitiveness, he would have to apologise for and excuse his own conduct. That was unendurable—that was ignominious—that was even absurd. His virility kicked at it. There is something essentially insulting and degrading to one's manhood in having to tell a girl you've pretended to love, that you really and truly don't love her—that you only care for her in a sisterly fashion. It is practically to unsex one's self. A pretty girl appeals quite otherwise to the man that is in us. Hugh felt it bitterly and deeply—for himself, not for Elsie. He pitied his own sad plight most sincerely. But then, there was poor Elsie to think of too. No use in the world in blinking that. Elsie loved him very, very dearly. True, they had never been engaged to one another—so great is the love of consistency in man, that even alone in his own mind Hugh continued to hug that translucent fiction; but she had been very fond of him, undeniably fond of him, and he had perhaps from time to time, by overt acts, unduly encouraged the display of her fondness. It gratified his vanity and his sense of his own power over women to do so: he could make them love him—few men more easily—and he liked to exercise that dangerous faculty on every suitable subject that flitted across his changeful horizon. The man with a mere passion for making conquests affords no serious menace to the world's happiness; but the man with an innate gift for calling forth wherever he goes all the deepest and truest instincts of a woman's nature, is—when he abuses his power—the most deadly, terrible, and cruel creature known in our age to civilised humanity. And yet he is not always deliberately cruel; sometimes, as in Hugh Massinger's case, he almost believes himself to be good and innocent.

He had warned Winifred to whisper nothing for the present to Elsie about this engagement of theirs. Elsie was his cousin, he said—his only relation—and he would dearly like to tell her the secret of his heart himself in private. He would see her that evening and break the news to her. 'Why break it?' Winifred had asked in doubt, all unconscious. And Hugh, a strange suppressed smile playing uneasily about the corners of his thin lips, had answered with guileless alacrity of speech: 'Because Elsie's like a sister to me, you know, Winifred; and sisters always to some extent resent the bare idea of their brothers marrying.'

For as yet Elsie herself suspected nothing. It was best, Hugh thought, she should suspect nothing. That was a cardinal point in his easy-going practical philosophy of life. He never went half-way to meet trouble. Till Winifred had accepted him, why worry poor dear Elsie's gentle little soul with what was, after all, a mere remote chance, a contingent possibility? He would first make quite sure, by actual trial, where he stood with Winifred; and then—and then, like a thunderbolt from a clear sky, he might let the whole truth burst in full force at once upon poor lonely

Elsie's devoted head. Meanwhile, with extraordinary cleverness and care, he continued to dissemble. He never made open love to Winifred before Elsie's face; on the contrary, he kept the whole small comedy of his relations with Winifred so skilfully concealed from her feminine eyes, that to the very last moment Elsie never even dreamt of her pretty pupil as a possible rival, or regarded her in any other conceivable light than as the nearest of friends and the dearest of sisters. Whenever Hugh spoke of Winifred to Elsie at all, he spoke of her lightly, almost slightly, as a nice little girl, in her childish way—though much too blue-eyed—with a sort of distant bread-and-butterish schoolroom approbation, which wholly misled and hoodwinked Elsie as to his real intentions. And whenever he spoke of Elsie to Winifred, he spoke of her jestingly, with a good-humoured, unmeaning, brotherly affection that made the very notion of his ever contemplating marriage with her seem simply ridiculous. She was to him indeed as the deceased wife's sister is in the eye of the law to the British widower. With his easy, off-hand London cleverness, he had baffled and deceived both those innocent, simple-minded, trustful women; and he stood face to face now with a general *éclaircissement* which could no longer be delayed, but whose ultimate consequences might perhaps prove fatal to all his little domestic arrangements.

Would Elsie in her anger set Winifred against him? Would Winifred, justly indignant at his conduct to Elsie, refuse, when she learned the whole truth, to marry him?

Nonsense—nonsense. No cause for alarm. He had never really been engaged to Elsie—he had said so to her face a thousand times. If Elsie chose to misinterpret his kind attentions, bestowed upon her solely as his one remaining cousin and kinswoman, the only other channel for the blood of the Massingers, surely Winifred would never be so foolish as to fall blindly into Elsie's self-imposed error, and to hold him to a bargain he had over and over again expressly repudiated. He was a barrister, and he knew his ground in these matters. Chitty on Contract lays it down as an established principle of English law that free consent of both parties forms a condition precedent and essential part of the very existence of a compact of marriage.

With such transparent internal sophisms did Hugh Massinger strive all day to stifle and smother his own conscience; for every man always at least pretends to keep up appearances in his private relations with that inexorable domestic censor. But as evening came on, cigarette in mouth, he strolled round after dinner, by special appointment, to meet Elsie at the big poplar. They often met there, these warm summer nights; and on this particular occasion, anticipating trouble, Hugh had definitely arranged with Elsie beforehand to come to him by eight at the accustomed trysting-place. The Meyseys and Winifred had gone out to dinner at a neighbouring vicarage; but Elsie had stopped at home on purpose, on the hasty plea of some slight passing headache. Hugh had specially asked her to wait and meet him. Better get it all over at once, he thought to himself, in his shortsighted wisdom—like the measles or the

chicken-pox—and know straight off exactly where he stood in his new position with these two women.

Women were the greatest nuisance in life. For his own part, now he came to look the thing squarely in the face, he really wished he was well quit of them all for good and ever.

He was early for his appointment; but by the tree he found Elsie, in her pretty white dress, already waiting for him. His heart gave a jump, a pleased jump, as he saw her sitting there before her time. Dear, dear Elsie; she was very, very fond of him! He would have given worlds to fling his arms tight around her then, and strain her to his bosom and kiss her tenderly. He would have given worlds, but not his reversionary chances in the Whitestrang property. Worlds don't count: the entire fee-simple of Mars and Jupiter would fetch nothing in the real-estate market. He was bound by contract to Winifred now, and he must do his best to break it gently to Elsie.

He stepped up and kissed her quietly on the forehead, and took her hand in his like a brother. Elsie let it lie in her own without remonstrance. They rose and walked in lovers' guise along the bank together. His heart sank within him at the hideous task he had next to perform—nothing less than to break poor Elsie's heart for her. If only he could have shuffled out of it sideways anyhow! But shuffling was impossible. He hated himself; and he loved Elsie. Never till that moment did he know how he loved her.

This would never do! He was feeling like a fool. He crushed down the love sternly in his heart, and began to talk about indifferent subjects—the wind, the river, the rose-show at the vicarage. But his voice trembled, betraying him still against his will; and he could not refrain from stealing sidelong looks at Elsie's dark eyes now and again, and observing how beautiful she was, after all, in a rare and exquisite type of beauty. Winifred's blue eyes and light brown hair, Winifred's small mouth and moulded nose, Winifred's insipid smile and bashful blush, were cheap as dirt in the matrimonial lottery. She had but a doll-like, Lowther Arcade style of prettiness. Maidenly as she looked, one twist more of her nose, one shade lighter in her hair, and she would become simply bar-maidenly. But Elsie's strong and powerful, earnest face, with its serious lips and its long black eyelashes, its profound pathos and its womanly dignity, its very irregularity and faultiness of outline, pleased him ten thousand times more than all your baby-faced beauties of the conventional, stereotyped, ballroom pattern. He looked at her long and sighed often. Must he really break her heart for her? At last he could restrain that unruly member, his tongue, no longer. 'Elsie,' he cried, eyeing her full in a genuine outburst of spontaneous admiration, 'I never in my life saw any one anywhere one-half so beautiful and graceful as you are!'

Elsie smiled a pleased smile. 'And yet,' she murmured, with a half-malicious, teasing tone of irony, 'we're not engaged, Hugh, after all, you remember.'

Her words came at the very wrong moment; they brought the hot blood at a rush into Hugh's cheek. 'No,' he answered coldly, with a sudden

revulsion and a spasmodic effort; 'we're not engaged—nor ever will be, Elsie!'

Elsie turned round upon him with sudden abruptness in blank bewilderment. She was not angry; she was not even astonished; she simply failed altogether to take in his meaning. It had always seemed to her so perfectly natural, so simply obvious that she and Hugh were sooner or later to marry one another; she had always regarded Hugh's frequent reminder that they were not engaged as such a mere playful warning against too much precipitancy; she had always taken it for granted so fully and unreservedly that whenever Hugh was rich enough to provide for a wife he would tell her so plainly, and carry out the implied engagement between them—that this sudden announcement of the exact opposite meant to her ears less than nothing. And now, when Hugh uttered those cruel, crushing, annihilating words, 'Nor ever will be, Elsie,' she couldn't possibly take in their reality at the first blush, or believe in her own heart that he really intended anything so wicked, so merciless, so unnatural.

'Nor ever will be!' she cried, incredulous. 'Why, Hugh, Hugh, I—I don't understand you.'

Hugh steeled his heart with a violent strain to answer back in one curt, killing sentence: 'I mean it, Elsie; I'm going to marry Winifred.'

Elsie gazed back at him in speechless surprise. 'Going to marry Winifred?' she echoed at last vaguely, after a long pause, as if the words conveyed no meaning to her mind. 'Going to marry Winifred? To marry Winifred!—Hugh, did you really and truly say you were going to marry Winifred?'

'I proposed to her this morning,' Hugh answered outright, with a choking throat and a glassy eye; 'and she accepted me, Elsie; so I mean to marry her.'

'Hugh!'

She uttered only that one short word, in a tone of awful and unspeakable agony. But her bent brows, her pallid face, her husky voice, her startled attitude, said more than a thousand words, however wild, could possibly have said for her. She took it in dimly and imperfectly now; she began to grasp what Hugh was talking about; but as yet she could not understand to the full all the man's profound and unfathomed infamy. She looked at him feebly for some word of explanation. Surely he must have some deep and subtle reason of his own for this astonishing act and fact of furtive treachery. Some horrible combination of adverse circumstances, about which she knew and could know nothing, must have driven him against his will to this incredible solution of an insoluble problem. He could not of his own mere motion have proposed to Winifred. She looked at him hard: he quailed before her scrutiny.

'I love you, Elsie,' he burst out with an irresistible impulse at last, as she gazed through and through him from her long black lashes.

Elsie laid her hand on his shoulder blindly. 'You love me,' she murmured. 'Hugh, Hugh, you still love me?'

'I always loved you, Elsie,' Hugh answered bitterly with a sudden pang of abject remorse; 'and as long as I live I shall always love you.'

'And yet—you are going to marry Winifred!'
'Elsie! You and I were never engaged.'

She turned round upon him fiercely with a burst of horror. He, to take refuge in that hollow excuse! 'Never engaged!' she cried, aghast. 'You mean it, Hugh?—you mean that mockery?—And I, who would have given up my life for love of you!'

He tried to assume a calm judicial tone. 'Let us be reasonable, Elsie,' he said, with an attempt at ease, 'and talk this matter over without sentiment or hysterics. You knew very well I was too poor to marry; you knew I always said we were only cousins; you knew I had my way in life to make. You could never have thought I really and seriously dreamt of marrying you.'

Elsie looked up at him with a scared white face. That Hugh should descend to such transparent futilities! 'This is all new to me,' she moaned out in a dazed voice. 'All, all—quite, quite new to me.'

'But, Elsie, I've said it over and over a thousand times before.'

She gazed back at him like a stone. 'Ah, yes; but till to-day,' she murmured slowly, 'you never, never, never meant it.'

He sat down, unmanned, on the grass by the bank. She seated herself by his side, mechanically as it were, with her hand on his arm, and looked straight in front of her with a vacant stare at the angry water. It was growing dark. The shore was dark, and the sea, and the river. Everything was dark and black and gloomy around her. She laid his hand one moment in her own. 'Hugh!' she cried, turning towards him with appealing pathos, 'you don't mean it now: you will never mean it. You're only saying it to try and prove me. Tell me it's that! You're yourself still. O Hugh, my darling, you can never mean it!'

Her words burnt into his brain like liquid fire; and the better self within him groaned and faltered; but he crushed it down with an iron heel. The demon of avarice held his sordid soul. 'My child,' he said, with a tender inflection in his voice as he said it, 'we must understand one another. I do seriously intend to marry Winifred Meysey.'

'Why?'

There was a terrible depth of suppressed earnestness in that sharp short *why*, wrung out of her by anguish, as of a woman who asks the reason of her death-warrant. Hugh Massinger answered it slowly and awkwardly with cumbersome, round-about, self-exculpating verbosity. As for Elsie, she sat like a statue and listened: rigid and immovable, she sat there still; while Hugh, for the very first time in her whole experience, revealed the actual man he really was before her appalled and horrified and speechless presence. He talked of his position, his prospects, his abilities. He talked of journalism, of the bar, of promotion. He talked of literature, of poetry, of fame. He talked of money, and its absolute need to man and woman in these latter days of ours. He talked of Winifred, of Whitestrand, and of the Meysey manor-house. 'It'll be best in the end for us both, you know, Elsie,' he said argumentatively, in his foolish rigmorole, mistaking her silence for something like unwilling acqui-

escence. 'Of course I shall still be very fond of you, as I've always been fond of you—like a cousin only—and I'll be a brother to you now as long as I live; and when Winifred and I are really married, and I live here at Whitestrand, I shall be able to do a great deal more for you, and help you by every means in my power, and introduce you freely into our own circle, on different terms, you know, where you'll have chances of meeting—well, suitable persons. You must see yourself it's the best thing for us both. The idea of two penniless people like you and me marrying one another in the present state of society is simply ridiculous.'

She heard him out to the bitter end, revealing the naked deformity of his inmost nature, though her brain reeled at it, without one passing word of reproach or dissent. Then she said in an icy tone of utter horror: 'Hugh!'

'Yes, Elsie.'

'Is that all?'

'That is all.'

'And you mean it?'

'I mean it.'

'Oh, for Heaven's sake, before you kill me outright, Hugh, Hugh! is it really true? Are you really like that? Do you really mean it?'

'I really mean to marry Winifred.'

Elsie clasped her two hands on either side of her head, as if to hold it together from bursting with her agony. 'Hugh,' she cried, 'it's foolish, I know, but I ask you once more, before it's too late, in sight of Heaven, I ask you solemnly, are you seriously in earnest? Is that what you're made of? Are you going to desert me? To desert and betray me?'

'I don't know what you mean,' Hugh answered stonily, rising as if to go—for he could stand it no longer. 'I've never been engaged to you. I always told you so. I owe you nothing. And now I mean to marry Winifred.'

With a cry of agony, she burst wildly away from him. She saw it all now; she understood to the full the cruelty and baseness of the man's innermost underlying nature. Fair outside; but false, false, false to the core! Yet even so, she could scarcely believe it. The faith of a lifetime fought hard for life in her. He, that Hugh she had so loved and trusted—he, the one Hugh in all the universe—he to cast her off with such callous selfishness! He to turn upon her now with his empty phrases! He to sell and betray her for a Winifred and a manor-house! Oh, the guilt and the sin of it! Her head reeled and swam round deliriously. She hardly knew what she felt or did. Mad with agony, love, and terror, she rushed away headlong from his polluted presence—not from Hugh, but from this fallen idol. He saw her white dress disappearing fast through the deep gloom in the direction of the poplar tree, and he groped his way after her, almost as mad as herself, struck dumb with remorse and awe and shame at the ruin he had visibly and instantly wrought in the fabric of that trustful girl's whole being.

One moment she fled and stumbled in the dark along the grassy path toward the roots of the poplar. Then he caught a glimpse of her for a second, dimly silhouetted in the faint starlight, a wan white figure with outstretched arms against the black horizon. She was poisoning, irresolute,

on the gnarled roots. It was but for the twinkling of an eye that he saw her; next instant, a splash, a gurgle, a shriek of terror, and he beheld her borne wildly away, a helpless burden, by that fierce current towards the breakers that glistened white and roared hoarsely in their savage joy on the bar of the river.

In her agony of disgrace, she had fallen, rather than thrown herself in. As she stood there, undecided, on the slippery roots, with all her soul burning within her, her head swimming and her eyes dim, a bruised, humiliated, hopeless creature, she had missed her foothold on the smooth worn stump, slimy with lichens, and raising her hands as if to balance herself, had thrown herself forward, half wittingly, half unconsciously, on the tender mercies of the rushing stream. When she returned for a moment, a little later, to life and thought, it was with a swirling sense of many waters, eddying and seething in mad conflict round her faint numb form. Strange roaring noises thundered in her ear. A choking sensation made her gasp for breath. What she drank in with her gasp was not air, but water—salt brackish water, an overwhelming flood of it. Then she sank again, and was dimly aware of the cold chill ocean floating around her on every side. She took a deep gulp, and with it sighed out her sense of life and action. Hugh was lost to her, and it was all over. She could die now. She had nothing to live for. There was no Hugh; and she had not killed herself.

Those two dim thoughts were the last she knew as her eyes closed in the rushing current: there had never been a Hugh; and she had fallen in by accident.

(To be continued.)

VOLAPÜK:

THE NEW LANGUAGE.

DURING the past three centuries the attention of many linguists, more especially those of France and Germany, has been turned to the possibility of constructing a language which shall serve as a means of international communication. Many attempts have been made in this direction, and some fifty different plans have been advocated for accomplishing this desirable object; but they have all been failures, and for the same reason that many other enterprises come to nought—namely, that they have not been suited to the comprehension of that large majority of persons who require the utmost simplicity in any matter which they are required to learn and understand. These linguists wrote not for the many, but for those whose minds were as cultivated and receptive as their own; hence they failed. Other suggested methods of accomplishing this international uniformity in speech and writing, when they came to be examined critically, were found to be little better than mutilated editions of existing tongues. And so the question rested until M. Schleyer of Constance took it up, and produced for the first time a scheme which gives some indications of being successful. This international language is called Volapük, that is, 'world-speech.'

In constructing this new language, M. Schleyer has aimed at extreme simplicity, and has laid existing European tongues under contribution.

More especially is this the case with English, and for the very good reason, that the English language is the mother-tongue of one hundred million persons. That is to say, there are nearly double the number of persons who speak English as compared with those who speak German, and more than double the number as compared with those whose native tongue is either French or Spanish. But while M. Schleyer gives this preference to English, the characteristic features of other languages have been freely adopted. The simple construction of the French language forms a model for the construction of Volapük; indeed, so simple in structure and design is this new tongue, that it is claimed by its adherents to be easily learned in a few weeks, provided that the learner is already a master of a Romanic language, such as French or Italian; or a Germanic one, such as English or German.

With regard to pronunciation, it may be objected that a universal system is an impossibility; but the objection is not a serious one, when it is remembered that no uniformity of pronunciation exists in any existing language. For instance, a Cornishman and his countryman from Lancashire are both supposed to speak the same language; but their actual speech is so different that they find it hard to understand one another. Two Frenchmen, one from the north and the other from the south of their native country, would find themselves in the same difficulty; and it is easy to see that instances such as these could be multiplied indefinitely, particularly when we remember that in the present day some eight hundred different languages are in use upon the earth.

The simplicity of Volapük is one of its most noteworthy features, and one which guarantees more than any other can do its probable success. Every letter has one and the same sound, and, moreover, each word is written exactly as it is pronounced. There are no such incongruities as 'through,' 'plough,' 'cough,' and 'enough,' which, although spelt in the same way, are sounded so differently; and the student who has once mastered the vowel sounds, which are much the same as in French, will have no difficulty whatever in reading Volapük; for the consonants, with one or two exceptions, are the same as they are in English. The average schoolboy will think well of Volapük when he hears that it has no artificial genders, and no irregular verbs like German and French, that it possesses but a single conjugation, and that it forms the plural simply by adding *s*. But let us give an instance of its simplicity of construction, and one which shows how the adjective and adverb are formed from the substantive, and how they have invariably the same termination. First, we will take the substantive *dol*, pain, the derivation of which is obvious. By adding the syllable *ik* to this word, we at once turn it into the adjective *dolik*, painful; while the simple addition to this adjective of the letter *o* gives us the adverb *doliko*, painfully. The verbs, too, are mainly formed from the substantive; for instance, *pük* is language, while *pükon* is to speak. Want of space forbids us to quote any more examples; nor is it necessary for us to do so; for those who wish to learn more concerning this interesting subject can obtain at small cost an abridged grammar of Volapük, which has been

adapted to English-speaking people by Professor Kerchhoffs. It is published by Messrs Hachette & Co., of Charing Cross, London, and we are indebted to it for much of the information contained in the present article.

It may naturally be asked, what prospects are there of the adoption of this international language? If we can judge from the number of its disciples, who are said to amount to many thousands in the different states of Europe, we must acknowledge that the progress made since the publication of M. Schleyer's works in 1881 is very wonderful. These books consist of a grammar and a German dictionary of nearly thirteen thousand words, and they are about to be translated into all the languages of Europe and of Asia; indeed, the English version of the dictionary will be ready, we believe, almost as soon as these words appear in print. In preparing these works, M. Schleyer has been assisted by some of the most eminent linguists. Beyond this means of promoting a widespread knowledge of Volapük, we must not omit to notice that the first Congress of its promoters was held in 1886 at Friedrichshaven, on the Lake of Constance, when three hundred members from all parts of Europe were present. Another Congress was held only a few months afterwards at Munich, which was equally well attended. But we shall be able to judge before long of the number of adherents which this new language has, for a great International Congress is to be held at Paris in the year 1889, on the occasion of the Universal Exhibition in that city. At this Congress, delegates from all the different Societies of Europe—which number no fewer than seventy—as well as delegates from certain Societies in America, will meet together, and we shall then have a means of finding out how far Volapük has advanced in public favour.

After all, this endeavour to weave together some community of expression from existing languages is, if what philologists tell us be true, merely a return to what must have prevailed in the long forgotten past. There are so many points of agreement between the various languages and dialects of Europe, as well as between certain important languages of Asia, that little doubt is entertained that they have had one common origin in a primitive Aryan mother-speech. Dissolved into a number of different tongues, it would seem an almost superhuman work once more to construct from them a vocabulary which can be common to all; and the difficulty is proved by the number of failures which have been recorded; until M. Schleyer, after many years of patient labour, invented Volapük.

There are many who have indulged in the dream that a universal language would be found in the beautiful art of music; and so it is to some extent; for we all know that various feelings and thoughts can be readily suggested by its influence. No one can tell us exactly why the delicate tracery of one of Chopin's mazurkas should affect us so differently from the weird strains of the Funeral March by the same composer. Each speaks to us eloquently, but no two hearers will receive exactly the same impression, and to many of course the sounds are utterly meaningless. M. Schleyer's Volapük is formed upon a more substantial basis; and we must

admit, that if not destined to become a universal language in the future, it is the best attempt at such a consummation which we have yet seen.

HELEN'S ESCAPE.

CHAPTER IV.—CONCLUSION.

HELEN's health became a subject of such anxiety to me, that I determined to remove her for a while from the neighbourhood of scenes fraught with such painful associations; so we closed our house and started on a prolonged foreign tour. We travelled for three months in Italy, Sicily, and the Riviera, and at the end of September arrived in Paris, where we proposed to remain a few days previous to returning home.

I am an old habitu   of Paris, and I have always remarked how, in the absence of any startling crime, the complaint rises of the lack of news. Politics are all very well, and serve to keep the *flâneurs* of the boulevards and a certain section of the people provided with topics for conversation and discussion; but the typical Monsieur Prudhomme likes nothing better than a good startling crime, with plenty of harrowing details, and a strong spice of mystery about it.

We were not very long in Paris before we found out that the all-absorbing topic of interest was 'l'affaire Arosa.' Wherever we went, we heard of nothing but 'l'affaire Arosa.' The hawkers cried it on the boulevards; in trams and omnibuses and trains it was the subject of conversation; the waiters at the hotel whispered about it during the intervals between the courses at the *table d'hôte*; the first part of the daily paper attacked was that which was headed 'l'affaire Arosa.'

The name Arosa seemed familiar to me; at any rate, I remembered to have heard it, but for the life of me, I could not recall when or under what circumstances; so I bought a *Gaulois* with the view of enlightening myself about 'l'affaire Arosa,' and on the chance that something therein might bring to my mind the circumstances with which, in my memory, the name Arosa was associated. I had not read half-a-dozen lines before I was carried back in imagination to the Rue de Douai during the seven days of the Commune, and was again face to face with the poor cowering wretch who had given his name to me as Dixon Rayne. The following is a free translation of what I read: 'It was elicited in the course of examination that the accused, who, although an Englishman by birth, is a cosmopolitan in crime, and speaks half-a-dozen European languages fairly well, had been the keeper of a well-known gambling saloon in the Rue de Provence for some years, and that he had been ruined during the siege. For some time previously he had been paying marked attentions to Madame Arosa, an invalid Spanish lady of great wealth, undoubtedly with the sole object of getting her money. It appears, however, that his suit was rejected, and that he was driven to the lowest depths of despair. On the night of May 27, 1871, when the Communist cause was making its last struggle, and the city was in indescribable confusion and panic, Madame Arosa, who was known to have withdrawn all her securities from the banking-house of Messrs Fould, ready for instant flight to Spain as soon as a safe passage could

be secured, was found murdered in her bedroom. Her strong-box had been violently broken open and rifled of its contents, and the means of escape employed by the murderer was quite evident, as a window of yellow-stained glass was found broken, and there were marks of feet on the leads below. In spite of the prevalent confusion—for there was severe fighting going on in all the streets around Madame Arosa's house in the Rue Blanche—the alarm was raised by some women who had witnessed the escape of the murderer, and he was pursued. In the confusion of the streets, however, he made good his escape, and contrived to get over to England. The property he stole amounted to a million francs, mostly invested in French and English railways. The President of the court paid a high tribute to the energy and intelligence of Detective Commissary De Bussy, who has for five years been engaged in following up this crime, and who has at last succeeded in bringing a diabolical criminal to justice.

'De Bussy!—Arosa!' I muttered to myself. 'I know both the names.—Ah! Now I remember!'

I rushed off to an old friend in the Embassy for the purpose of procuring a seat in the Palais de Justice; for I had had sufficient experience of French criminal courts to know that upon the occasions of great cases admittance thereto without an order is almost impossible. I had got half-way down the Rue de Rivoli, when some one coming down a by-street stumbled against me, and would have knocked me over but that he caught me in his arms. I looked. It was Monsieur Pontneuf!

I do not know what the loungers under the arcade must have thought was the matter with me, but at the sight of this man—the murderer of my neighbour and intended son-in-law; the wrecker of my child's happiness—at the sight of his cool, calm smile and of his brazen face, I fairly staggered and uttered a cry of amazement.

'Why,' he said, 'you seem surprised to see me. Haven't you had my letters? When I saw you, I made sure that you had come over in answer to them.—No?'

'Monsieur Pontneuf'—I began, in as dignified and scornful a tone as my horror and surprise would allow me to assume.

'No, no; that's all done with,' he interrupted. 'My name's De Bussy'—

'You—De Bussy—the great detective?' I stammered.

'Yes, yes.—I see you don't know anything about it. Look here. I'm in a great hurry, as the court opens at ten. Here's my card. Give that in at the door, and you will get in. Don't be late!—Au revoir!' And before I could collect my scattered senses, he was lost in the crowd. I examined the card; it had simply on it—'DE BUSSY, Dépôt de Police, Rue Mazas.'

What did it all mean? I had heard of the adage, 'Set a thief to catch a thief,' but never of 'Set a murderer to catch a murderer;' yet here was this man, who had clearly and unmistakably killed Jack Corner, posing as the industrious and intelligent representative of order and justice, and aiding in sending a fellow-creature into eternity. However, I had no time to stand speculating, as I must run back to the hotel and tell the ladies whither I was bound, and get to the Palais de Justice at a few minutes before ten.

The court was already crowded to overflowing, but De Bussy's card acted as an open sesame, and I was politely ushered to a seat near to the representatives of the press, close to the prisoner's dock. As the clock struck ten, the judge entered, followed by a crowd of barristers and lawyers, and the hum of general conversation was immediately stopped. Presently the hum arose again for a moment, and all that sea of anxious faces was turned towards a small door at the side of the court. Through this entered, attended on either side by fierce-looking gendarmes, the prisoner. Imagine my amazement when I recognised at once, in spite of shaved beard and whiskers, Jack Corner! At this distance of time, I can hardly tell what feelings were uppermost within me at this extraordinary *denouement*. Perhaps better than by any description of mine they can be realised by any one who can imagine an old and trusted friend, lamented as the victim of a fiendish outrage, suddenly proved to be a villain of the deepest dye; and a man long suspected and sought after as a murderer, standing forth as the champion of justice and right. My gaze was riveted on the prisoner, who seemed to be perfectly indifferent to his awful position; and presently, in the course of his almost defiant glance around the court, his eyes met mine, and, with a wave of his hand, he nodded me a greeting.

The case, which had already lasted a week, proceeded; but it was impossible to pay much attention to it, so occupied was I with running over the incidents of my acquaintance with the man who now stood before me on trial for his life; and so full of thankfulness was I that my poor Helen had been spared union in holy wedlock with such a man. A sudden silence in court diverted my attention to what was going on around me, and I heard sentence of death pronounced upon the murderer of Madame Arosa, my quondam intimate, John Corner. Then the crowd hurried away chattering and laughing, as from a play-house; but I waited for De Bussy.

'Come and dine with me to-night,' I said, 'and then you can tell us quietly all that has taken place since we last sat at table together.'

He accepted the invitation; and I hastened to the hotel to inform my wife and Helen of what had taken place—news which, I need scarcely say, was received by them with astonishment and thankfulness as great as was mine.

De Bussy dined with us, and afterwards told us as follows:

'I need not detail to you the troubles and difficulties with which I had to cope before I could fairly persuade myself that I was on the track of the right man. Even after I had lived with you for some time as professor of French, I was not sure enough of my man to feel justified in making a *coup*; and had it not been that as a French officer of police I was enabled to terrorise, so to speak, the girl Gabrielle, and to extort information about Mr Rayne's movements?—

I caught at the name Rayne, and said: 'About whose movements?'

'Rayne's—Dixon Rayne's.—Why, dear me, I was going to omit to tell you as curious a thing as there is in the whole affair. You may perhaps remember, when you told me of your adventure during the Commune, how interested I was. Well,

no wonder, considering that I was after none other than Mr Dixon Rayne.'

'Then, do you mean to say that the man who took refuge in my room in Paris, and the murderer of Madame Arosa, and Mr John Corner are one and the same?' I said, more astonished than ever.

'Certainly I do,' replied the officer; 'and I'm not astonished at your not being able to recognise him, when he has baffled the most clever detectives of Europe during these five years. His hands were yet hot with the murder of the poor old lady, when he claimed your protection.—But to my own story. As I was saying, Gabrielle gave me a lot of information concerning our friend's movements, or I verily believe he would have escaped again. As it was, directly he found out that I was in the habit of meeting the girl on the quiet, he smelt a rat; and we have since found out that his pretended visit to Switzerland meant that he had arranged for flight at a moment's notice. Well, I dined with you that evening, and you left us alone, if you remember. We talked, and each knew that the other was trying to sound him. At length, Corner suggested that we should go out for a stroll. I acceded; and we went out into the garden, I still keeping the conversation fixed upon the murder of Madame Arosa, for, although I was pretty sure of my man, I felt that I might convince myself thoroughly before I made the final pounce. Well, as we reached the path by the stream, he suddenly sprang at me, struck me several times with a sharp instrument, which, however, only wounded me, as I always wear a steel protector under my outer garments; then he stunned me with a final blow, and when I recovered consciousness, I was lying on my back half in and half out of the stream. Wounded and exhausted with loss of blood as I was, I made all the haste I could, went to my lodgings, changed my clothes, and then hurried on to the Cedars, not quite expecting to see my man, although I thought it possible that, in the full belief that he had killed me, he might remain until the morrow. So I was not surprised to find him not there. Knowing that he could not get out of the country at any rate that night, I determined not to waste a minute, and luckily falling in with a carrier's cart, got up to London. I kept the matter quite quiet, not even informing Scotland Yard of the matter, for I made pretty sure of the capture. But he gave me the slip, he and his precious aunt, for all that; and it was only six weeks back that I nailed my gentleman quietly reading his paper in a restaurant on the boulevards. I was on him like a cat, in spite of his assumption of outraged innocence; and next Thursday he makes his last appearance in public on the Place de la Roquette.—By the way, I must have left a pocket-book at my lodgings with valuable information in it of no use to any one but the owner.'

'I have it,' I replied; 'and you must come over and spend your first holiday with us, for I shall never know how to atone sufficiently for the terrible opinion of you which, through me, has been spread about.'

'Of me?' said the detective.

'Why, certainly,' I replied. 'At this moment, in and about Kensham you are believed to have

murdered Corner; and until this morning, we believed the same thing.'

'Circumstances certainly looked ugly against me,' said De Bussy; 'but you see the success of my movements depended entirely upon absolute secrecy.'

'Suppose you had been arrested?' I said.

'The freemasonry among our profession would have prevented that.'

Helen still remains at home, for she says that she can never give to another man the love she gave to Corner, although she is heartily thankful for her narrow escape from marrying him. De Bussy paid us his promised visit, and brought with him his wife and Miss Gabrielle, who renewed her abruptly broken-off acquaintance with Mr Corner's coachman, and married him.

THE POETRY OF TOAST LISTS AND MENU CARDS.

THE public-dinner season in provincial England commences early in October and ends in the middle of March. During that period, at the slightest provocation our countrymen are prepared to dine together, not with a desire of over-indulgence in eating, but to enjoy the pleasant company usually gathered round the festive board. It is an admitted fact that the men who are in the habit of attending banquets are generally most abstemious. Speech, story, and song form a pleasing part of the proceedings of literary-society dinners, masonic banquets, and the more homely but not less enjoyable suppers held in connection with the Burns Clubs. The toast lists and menu cards are often very interesting; they are frequently artistic in design, and enriched with quotations from the poets, which render them of more than passing interest. A few quotations from some of the best of these which have come under our notice are surely worth reproducing. The authors represented cover a wide field, ranging from Shakespeare to Tennyson. The former is the most quotable poet, and he is most frequently drawn upon. Burns, however, runs him very closely.

In turning over a pile of toast lists, the first to attract our attention is the one prepared for the Hull Shakespearean Festival. On the front page is a portrait of the bard and the familiar line of 'rare' Ben Jonson:

He was not of an age, but for all time.

Under the first toast—that of the Queen—are two lines from *Henry V.*:

God and his angels, guard your sacred throne,
And make you long become it!

The toast of the evening follows: 'The Immortal Memory of Shakespeare'—Dr Johnson's well-known verse beneath it:

Each change of many-coloured life he drew;
Exhausted worlds, and then imagined new;
Existence saw him spurn her bounded reign,
And panting Time toiled after him in vain.

The third speaker had for his topic 'Shakespeare's Universality,' with a motto from *Romeo and Juliet*:

Monarch of the universal earth.

Actors and actresses were next toasted under the heading of 'Shakespearean Exponents,' with a quotation from *Othello*:

Speak of me as I am; nothing extenuate,
Nor set down aught in malice.

The next theme was 'Shakespeare and Tragedy,' with a line from *Richard III.*:

I live to look upon their tragedy.

Then followed 'Shakespeare and Comedy,' with two lines from the *Taming of the Shrew*:

Frame your mind for mirth and merriment,
Which bars a thousand harms.

Under the sentiment of 'Shakespeare and History,' is a line from *Henry IV.* (Part II.):

There is a history in all men's lives.

Lastly, 'Shakespearean Women' were remembered, and under the toast are three lines as follow from the third part of *Henry VI.*:

'Tis beauty that doth oft make women proud;
'Tis virtue that doth make them most admired;
'Tis modesty that makes them seem divine.

The programme of music is headed with a couple of lines from *Twelfth Night*:

If music be the food of love, play on;
Give me excess of it.

At the foot of the card is printed 'Good Night,' and a quotation from *Macbeth*, as follows:

At once good night:
Stand not upon the order of your going,
But go at once.

The toast list of a local literary society contains some happy quotations from Shakespeare. The speakers are reminded at the commencement of the programme, in the words from *Hamlet*, that 'Brevity is the soul of wit.' The two lines under the toast of 'The Prince and Princess of Wales' are from *Pericles*:

As jewels lose their glory if neglected,
So princes their renown if not respected.

A line from *Richard III.*—

Arm, fight, and conquer for England's sake,

was the motto to the toast of 'The Army, Navy, and Auxiliary Forces.' Under the toast of 'The Officers of the Club' are words from *Othello*: 'We cannot all be masters.'

Two good lines from the *Taming of the Shrew* are given with the toast of 'Literature and Science':

My books and instruments shall be my company,
On them to look and practise by myself.

A line under the toast of 'The Press' says, in the words of the *Merchant of Venice*, 'There are some shrewd contents in your paper.'

We have seen on several menu cards:

A good digestion to you all, and once more
I shower a welcome on you—welcome all.

Henry VIII.

A more general quotation (from *Macbeth*) is:

Now good digestion wait on appetite,
And health on both.

The bill of fare for the Tercentenary Banquet, held in 1864, at Stratford-on-Avon, in honour of

Shakespeare, is perhaps the best specimen of cuisine literature ever produced. The following are a few of the edibles and the quotations:

Roast turkeys:

Why, here comes swelling like a turkey-cock.

Henry V.

Roast fowls:

There is a fowl without a feather.

Comedy of Errors.

Ducks:

O dainty duck!—*Midsummer Night's Dream.*

Boar's head:

Like a full-acorned boar.—*Cymbeline.*

York hams:

Sweet stem from York's great stock.

Henry VI. (Part I.).

Tongues:

Silence is only commendable in a neat's tongue dried.—*Merchant of Venice.*

Mayonnaise of lamb:

Was never gentle lamb more mild.—*Richard II.*

Braised lamb and beef:

What say you to a piece of beef and mustard?

A dish that I love to feed upon.

Taming of the Shrew.

Roast lamb:

Come you to seek the lamb here?

Measure for Measure.

Lobster and mayonnaise salads:

Sallet was born to do me good.

Henry IV. (Part II.).

Dressed lobsters and crabs:

There's no meat like them; I could wish my best friend at such a feast.—*Timon of Athens.*

Dessert, cakes, jellies, and creams:

The queen of curds and cream.—*Winter's Tale.*

Dressed potatoes:

Let the sky rain potatoes.

Merry Wives of Windsor.

Bitter ale:

And here's a pot of good double beer, neighbour:
Drink, and fear not your man.

Henry VI. (Part II.).

In addition to the foregoing, many interesting and well-chosen quotations appear on the famous bill of fare.

The birthday of Burns is celebrated in all parts of the world; wherever Scotchmen are located this bard is honoured. We have before us a number of Burns dinner toast lists, and several are headed 'Should auld acquaintance be forgot?' One opens with Burns's grace, as follows:

O Thou who kindly dost provide
For every creature's want,
We bless Thee, God of nature wide,
For all thy goodness lent;
And if it please Thee, Heavenly Guide,
May never worse be sent,
But whether granted or denied,
Lord, bless us with content.—Amen.

The following are from the toast lists of the Hull Burns Club. Under the toast of 'The Queen,' two lines appear:

In the field of proud honour, our swords in our hand,
Our Queen and our country to save.

To the toast of 'The Mayor, Sheriff, and Corporation' is this couplet:

How wisdom and folly meet, mix, and unite;
How virtue and vice blend their black and their white.

The toast of the evening, 'The Memory of Burns,' has under it the following verse from *The Cotter's Saturday Night*:

O Scotia! my dear, my native soil!
For whom my warmest wish to Heaven is sent!
Long may thy hardy sons of rustic toil
Be blessed with health, and peace, and sweet content.

We have seen inscribed with this toast a verse from one of Bennoch's beautiful poems:

With reverent silence we will fill
A cup when'er this day returns,
And pledge the memory of the Bard,
The Bard of Nature—Robert Burns,
Immortal Burns.

Appended to the toast of 'The Hull Burns Club' are the noble lines:

It's coming yet, for a' that,
That man to man, the world o'er,
Shall brothers be for a' that.

'The Visitors,' 'Kindred Societies,' are included with suitable quotations. The verse under the toast of 'The Press' is a happy selection:

Here's freedom to him that wad read,
Here's freedom to him that wad write,
There's nae e'er feared that the truth should be heard,
But they whom the truth would indite.

We have seen the following quoted several times with this toast:

A chield's amang you takin notes,
And faith he'll prent it.

The concluding toast, that of 'The Lassies,' has the familiar lines:

The wisest man the warl' e'er saw,
He dearly loved the lassies, O!

This year, the toast list of the Hull Literary Club was enriched with quotations from the works of the Poet Laureate. An excerpt from *The Princess* on the first page says:

Hark the bell
For dinner, let us go!

Two lines from a poem, *To the Rev. F. D. Maurice*, head the list:

You'll have no scandal while you dine,
But honest talk and wholesome wine.

To the toast of 'The Queen' are four lines, as follow:

Her Court was pure; her life serene;
God gave her peace; her land reposed;
A thousand claims to reverence closed
In her as Mother, Wife, and Queen.

Five lines from *The Battle of Brunanburgh* are given to the toast of 'Our Brave Defenders':

Theirs was a greatness
Got from their grandsires—
Theirs that so often in
Strife with their enemies,

Struck for their hoards and their hearths and their homes.

Two quotations appear under the toast of 'Success to the Hull Literary Club':

We rub each other's angles down.—*In Memoriam*.

Work in noble brotherhood.—*Exhibition Ode*.

With the toast of 'Literature and the Arts' is the line:

Let knowledge grow from more to more.

Under 'The Press':

News from the humming city comes to it.

The line under the toast of 'The Ladies' is brief and graceful:

Made to be loved.

Other quotations are given; but we think we have reproduced sufficient to show the poetry of toast lists and menu cards.

THE MONTH:

SCIENCE AND ARTS.

It will be a disappointment to many that in the interesting autobiography recently published by M. Lesseps, which covers forty years of his life, there is hardly any mention of the Panama Canal. It is true that he bases his hopes of the success of that great venture upon what he has already achieved at Suez; and he is perhaps justified in quoting the adverse opinions which the latter scheme evoked in its day, as resembling the present opposition to his scheme at Panama. But this will not satisfy the shareholders. In the meantime it is interesting to turn to Mr Froude's opinion of the works at Panama. He describes the scene of operations as a damp tropical jungle, intensely hot, swarming with mosquitoes, snakes, alligators, and other disagreeable inhabitants. He tells of costly machinery consumed by rust, lying idle, unfit for the work for which it was intended. He also speaks of the skeletons of labourers picked clean by vultures. Altogether, the picture is by no means a reassuring one. It is true that he does not speak from personal knowledge, but from hearsay, and so it may be hoped that the reality is not quite so bad as he has painted it.

The *Army and Navy Gazette*, in alluding to the custom, which has prevailed for some centuries, of naming a warship after the reigning sovereign, gives a list of five of such vessels, with the dates of their construction appended, as follows: first we have the *Great Harry*, built in 1488; next comes the *Elizabeth*, one hundred years later; next, the *James Royal*, at another interval of one hundred years; then comes the ill-fated *Royal George* in last century; and lastly, the *Victoria* of the present year. The difference in the cost of these ships is remarkable. The first-named was built for the sum of fourteen thousand pounds; and each ship of the five shows an increase to the last on the list, which has cost nearly three-fourths of a million of money, and it must be observed that this large sum does not include its armament.

The succession of gruesome fogs which have lately darkened London to a terrible extent has once more brought forward the subject of smoke prevention. Sir Douglas Galton has recently been lecturing upon the subject, and among other statements he said that experiments had proved that the air in fog contained four times as much carbonic acid as usual. He also pointed out that the blackness of these metropolitan fogs undoubtedly arose from smoke proceeding from incompletely

burnt fuel, and he lays most of the blame upon the domestic fire-grate. As a remedy he proposes the use of gas for cooking, and says that all his experience proves that the open fire must be given up. At the same time, he is not blind to the advantages which this genial form of heat affords. There is no doubt that the open fire warms by radiation the walls and furniture of the room, while it leaves the air cooler and more fit to breathe than any other system. It is the absence of these conditions which causes a room which is heated by hot air or water to appear close and oppressive to those who are used to open fires.

Another interesting lecture upon a kindred subject was recently delivered by Mr Alfred Wilson at Birmingham. He took for his subject, 'Water-gas for Heating and Illuminating.' He pointed out the simple method in which this gas is produced. Ordinary gas-coke is raised to an incandescent heat by means of a blast of air in a cupola-shaped furnace. When at a sufficiently high temperature, steam is passed through the mass, and is decomposed, the result being an inflammable gas which consists of hydrogen and carbonic oxide. The mixture after passing through a washing arrangement is conveyed to a gas-holder; and it can be burnt with the help of one of the new incandescent burners furnished with a magnesia mantle, the light given being far more intense than that of ordinary gas. The cost of the gas is sixpence per thousand cubic feet; but the maintenance of the magnesia mantles raises the price to about double that sum. This gas contains but a small proportion of that compound of sulphur and carbon which causes such destruction to books and pictures. But this small amount has the advantage of rendering the gas sufficiently odorous to enable an escape to be easily detected. It is stated that the water-gas system is in use in more than two hundred and fifty towns in America. It is particularly adapted to the needs of an isolated country-house.

According to *La Nature*, another kind of gas is being turned to a useful purpose in some coal-mines near Aix-la-Chapelle. By means of a system of piping, the fire-damp is carried to the surface of the ground and used for heating purposes. The system is said to be perfectly successful; and is not only interesting but of great importance when we remember that this gas is the cause of explosions in coal-mines. The new process is therefore something more than the mere utilisation of a waste product.

Some excitement has recently been caused at Brighton by the appearance of a dogcart driven by electricity. The electric motor is placed under the body of the vehicle, and acts upon one of the wheels by a chain from a counter-shaft, the power being provided by sixteen small electric accumulators which are placed under the seats. The speed of this novel vehicle depends upon the nature of the road. Upon asphalt it amounts to nine miles an hour; but on an ordinary soft Macadam road this speed is reduced to less than half. With two passengers, the dogcart will ascend a moderate incline without difficulty.

It is said that a French experimenter has succeeded in making an artificial silk. The basis of this material is a collodion made by dissolving

nitro-cellulose in a mixture of alcohol and ether. This mixture is placed in a reservoir which is furnished with a blowpipe, through which the viscid liquid is forced in a fine stream. The fluid thread is projected into another vessel filled with acidulated water, which has the property of hardening it, and bestowing upon it the appearance of true silk. It is then rapidly dried in a current of air, and is wound on a suitable reel. It is of a gray colour, and can be easily subjected to the action of different dyes.

It seems that the monkeys on a certain island off the coast of South Burma have discovered for themselves the edible excellence of the oyster. Mr Alfred Carpenter of Bombay states that he has seen these animals select stones from the sea-beach of a size which they can easily grasp, and open the oysters by striking the upper valve of the shell until it breaks; the operator then carefully extracts the oyster with finger and thumb, and apparently enjoys it.

The Eiffel Tower, which is to form such a noteworthy feature at the coming Paris Exhibition, has already been completed up to a height of about two hundred feet, being one-fifth of the altitude which it is ultimately to attain. Its total height will therefore be about two and a half times the height of St Paul's Cathedral; and from it a wonderful view of Paris will be presented. In addition to its use as a means of extracting money from visitors to the Exhibition, it is proposed to establish on the summit of this tower an observatory for scientific purposes.

Our readers will remember that, at the recent Colonies Exhibition in London, a large collection of fruits from the antipodes was shown. It was thus seen that it was possible to transport perishable fruits from one side of the earth to the other, and yet present them to consumers in first-rate condition. The idea has been further expanded recently, the Peninsular and Oriental steamer *Thames* having brought to London a large consignment of Australian oranges. The experiment is a successful one, and reflects much credit on its originator, Dr Storer of Sydney. This gentleman has found that oranges can be kept for an almost indefinite period if packed in sawdust or in paper which has been soaked in some antiseptic preparation.

The much-discussed law relating to oleo-margarine came into force on the 1st of January, and already a number of traders have been prosecuted and fined for not observing its conditions. A curious test for distinguishing between these compounds and true butter comes from New Jersey. A gentleman there who was engaged in analysing several samples of oleo-margarine and butter left these samples in his laboratory for a night. The next morning he found that the mice had been busy at the dishes; but they had carefully avoided the false, and confined their attentions to the true butter. In case this should be due to mere chance, some other samples were the next evening spread out for their scrutiny, and again the oleo-margarine was left intact at the expense of the butter. On placing a dish of oleo-margarine in the same place but without any butter in its company, it was found that the mice had eaten of the compound very sparingly. It thus appears that the little animals can distinguish between butter and its imitation, and that they

will eat the latter, but not if they can get the true article.

Nelson's flagship the *Victory*, which for more than fifty years has been moored at Portsmouth, and has been visited by thousands of people, has recently been overhauled in consequence of a leak which placed the old vessel in some jeopardy. The condition of the ship is found to be very much better than was anticipated, most of the timbers being as firm as when the vessel was launched. The *Victory* is now to be renovated, and will once more be placed in its old position.

There is an erroneous notion which is very widely spread, that the ice which forms on water is free of any impurities which that water may contain, and there is little doubt that many cases of disease may be traced to the confidence which exists in the truth of this dogma. Some recent experiments have been made in the United States which show that the notion has no foundation in fact. Various substances were purposely dissolved in water, which water was then frozen, it being found that the ice forming upon the water contained rather more of the dissolved solids than a similar weight of the water itself. We need hardly point out that the use of ice is far more common in America than it is here, it being regarded as a necessary rather than a luxury. Several epidemics have been traced in that country to the use of impure ice.

Professor Bonney believes that in the future, when growth of population causes the Thames and the Lea to become too contaminated for potable uses, it may be necessary to establish a system of double supply; one of a pure description for drinking, and the other for more common uses. He prophesies that ultimately London will have to derive its water-supply from North Wales, a change of conditions which would involve a cost of about twelve millions sterling.

The vice-consul at La Rochelle has just published a Report in which he cautions British merchants against frauds which are becoming common in the French brandy trade. In his district, owing to the almost total extinction of the vineyards, a beverage called claret is made from steeping raisins and currants in water and mixing the compound with cheap Spanish wine. In other districts in France where the vineyards have suffered in the same way, brandy, so called, is made of a mixture of beetroot and cheap German spirit. This horrible compound is sent from Germany to Bordeaux or some other French port for what it really is, and is then re-marked and sent to London as cognac. In one case of fraud of this description, the offender was sentenced to a year's imprisonment and a heavy fine. It is to be hoped that in future cases, the French government will publish the names of the correspondents of these rascally dealers in this country, so that consumers may know whom to avoid.

Some interesting particulars concerning the distillation of peppermint and lavender at one of the principal factories at Mitcham, London, a neighbourhood which has long been famous for these products, have recently appeared in the *Chemist and Druggist*. During the past year, three thousand pounds of the essential oil of peppermint were distilled at this one factory. A large portion of the mint is grown on land belonging

to the place; but a great deal is brought in by growers in the surrounding villages. The best oil is obtained from the white mint, and this sells at from forty-five to fifty shillings a pound. With regard to lavender, the past season has been the best for many years, and five hundred pounds of oil were produced at this distillery. Only the leaves of the plant are placed in the still, as admixture with the stems is found to be prejudicial to the flavour.

A strange instance of poetical license was alluded to by Sir Robert Ball, Royal Astronomer for Ireland, during a recent lecture at the Royal Institution on the Moon. After quoting Wolfe's celebrated poem, *The Burial of Sir John Moore*, in which it will be remembered occur the words, 'by the struggling moonbeams' misty light,' he pointed out that Professor Naysmyth had proved conclusively by calculation that on the night that Sir John Moore was buried at Corunna, there could have been no moonlight at all. He also stated that some years ago, when he had mentioned this to the President of the Royal Irish Academy, that gentleman replied: 'It is all very well; but Wolfe's statement that there was moonlight on the night of the battle of Corunna will live long after all your astronomical calculations have been forgotten.'

Nearly one hundred and fifty years ago, Jonathan Swift wrote those oft-quoted lines to the effect that the flea has smaller fleas that on him prey, and that these have smaller still, and so on *ad infinitum*. We are reminded of these words in reading the appendix to Miss Ormerod's pamphlet on the Hessian Fly. It will be remembered that during last summer it was discovered that this dreaded fly was accompanied in its visit to this country by a parasite, which would probably help more in its extermination than any means which could be adopted by its human enemies. Miss Ormerod has succeeded in hatching out a number of these parasites, and seven distinct varieties have been already identified. It has further been proved that these parasites are all of Russian origin, and so the suspicion that the fly came originally from Russia is in this way confirmed.

A curious Museum is in course of arrangement at Paris, and a very handsome building for its accommodation has been erected near the Trocadero Palace. This building will contain a wonderful collection of idols and other objects formed by M. Guimet to illustrate the different religions of the world. Here will be found divinities from Egypt, Japan, China, India, Greece, Italy, and various other countries. In another part of the building there will be rooms for the use of students. This interesting Museum will be opened in a few months' time.

Again we have to chronicle the loss of a number of lives during the past year by mining explosions. The deaths from this cause amounted to one hundred and forty-two, or thirteen more than in the previous year; but as this number is considerably below the average for the ten years ending 1886, we cannot say that it is altogether unsatisfactory. Defective safety lamps and shot-firing are credited with most of these sad fatalities; but we may hope that the stringent measures which have now come into force under the new Mines Regulation Act will go far to

diminish them. In this connection, we may remark that we have recently seen some miners' safety lamps which seem to promise much for the future. These lamps are the outcome of Schanschiff's portable electric battery, and they seem to be simplicity itself. They are only a trifle heavier than the lamps now in use, are portable, will give a good light for eight hours without attention, at a cost of about one penny. When the battery solution is exhausted, it is simply turned out, and fresh solution poured in, a work which occupies only a few seconds, and can be done by an unskilled hand. There are two or three forms of this new lamp: the first gives four times the light of the old safety lamp; the second gives seven times that light; and there is a much larger form of lamp designed for special situations where three or four men can work together. In this case the battery is upon wheels, and the light is placed above it, and can be fixed at any convenient height.

A new method of preserving live fish, which seems to depend upon some phenomenon that it is at present difficult to explain, has been patented in America. The discoverer is Mr W. G. Murphy, of New York city, who found, from numerous experiments, that fish can be kept alive for a long time without either change of air or water, by placing them in a vessel partly filled with water, but hermetically sealed. Fish so placed in a closed jar were found alive and apparently in good health at the end of three weeks' confinement; while fish placed at the same time in an open jar of water all died within forty-eight hours. It was also found that when the air in the jar containing the fish and water was compressed, their life was still further prolonged. It has been suggested that the reason for these strange results lies in the fact that the water in the jar which is hermetically sealed does not undergo such rapid changes as water left in an open vessel. But the discovery is one which will be of very great use in the carriage and transportation of fish. Sportsmen, too, will appreciate a method which will permit them to carry live bait for an indefinite period.

UTILISATION OF WASTE PRODUCTS.

In a paper read before the Sheffield Literary and Philosophical Society, Mr Alfred H. Allen, President of the Society of Public Analysts, said: 'Another waste product which is deservedly appreciated as a manure consists in the sweepings and combings from woollen manufactories, known as "shoddy." Formerly, this was applied to the land in the raw state. The grease with which it was saturated acted as a preservative, and therefore detracted from its value as a manure; but no one would now think of neglecting to extract the grease from the wool before employing it on the land. The recovered grease is now recognised as a valuable secondary product; and when purified, the stearin or solid portion makes its appearance in the form of night-lights, and the olein or liquid part goes back to the woollen manufacturers to be used again.

'In the manufacture of soap, glycerine is produced in enormous quantities as a secondary product. Of the two chief processes of treating

fats, one produces good glycerine but inferior soap, and the other produces good soap but inferior glycerine. The quantity of glycerine hitherto thrown away in the soap-lyes has been something enormous, but now much of it is recovered. Thus at the works of Messrs Gossage, at Widnes, the largest soap-works in the world, the soap-lyes are boiled down, the salt separated, and the concentrated liquid distilled, whereby glycerine is obtained, which receives an enormous application in the manufacture of nitroglycerine. This, when soaked up in one-third of its weight of a porous earth called *kieselguhr*, forms the well-known explosive dynamite, which is produced in one single works to the extent of several tons per day. The glycerine produced from the waste soap-lyes at Messrs Gossage's works was often found unsuitable for its intended purpose, in consequence of containing sulpho-cyanides and other cyanogen compounds. By a process patented by myself and Mr Benjamin Nickels, these products are wholly removed from the soap-lyes, and thus a glycerine can be obtained from the impure source employed at Widnes as good in quality as that of any other origin. Curiously enough, this process, which has been now successfully at work at Widnes for some time, will shortly become unnecessary, owing to the introduction of an improved process of preparing the alkali used for saponifying the fat. By this process, due to Mathieson and Hawliezek, it will be freed from the objectionable sulphur and cyanogen compounds which hitherto had passed into the glycerine. At the same time the cyanogen compounds are destroyed, they will be converted into the useful form of ammonia. Truly, "the whirligig of time brings round its revenges."

IF YOU WERE HERE.

If you were here, how pleasant life would be;
How sweet the twilight of the closing year;
The fire, how warm and bright, my heart how free,
If you were here!

Whate'er befell, I would not shed a tear,
So I might spend my life in ministry
On you, whom death has made so passing dear.

Do you e'er mourn the past, and think of me?
Alas! I would not need my heart to cheer
With hopes forlorn—nor from dark dreams to flee,
If you were here!

P. W. ROOSE.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

- 1st. All communications should be addressed to the Editor, 339 High Street, Edinburgh.
- 2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.
- 3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them IN FULL.
- 4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

IN A TURKISH CITY.

FIRST PAPER.

THERE are still some places left in the world where a man may feel in exile. Railways, steamers, and telegraph lines have brought most parts of Europe within easy reach of the omnipresent travelling gentleman known to residents abroad as the T. G. There is an English society of one sort or another in most foreign towns; and where there is no society, there is a British merchant or two, or some one trying for a concession, or some one financing a railway. A man does not feel himself absolutely in exile when he can hear his own language spoken occasionally by residents or visitors; but here in Scutari—or Scodra, as it should properly be called—we so seldom see a T. G.'s face, or hear any English voices but our own, that we may fairly consider ourselves in exile. The place itself seems utterly ignored by the average Englishman. If I tell him I am going to Scodra, he says: 'O yes!' but his face shows that the name conveys no impression to his mind. If I say: 'It's generally called Scutari in Europe,' his face lights up, if he be a person of intelligence, and he replies: 'Oh, of course—where the Crimean cemeteries are.' Unfortunately, it is just where the Crimean cemeteries are not; but as people on the continent have resolved to call the capital of North Albania and the suburb of Constantinople by the same name, the mistake will naturally continue to occur. Not only is the place so difficult of access that it is almost impossible to reach it in less than ten days from England, but the post, that great solace of the exile, is extremely irregular. Letters come quickly enough as far as Trieste; but then they are put on board an Austrian Lloyd steamer, and spend nearly a week dawdling down the Adriatic, till they reach San Giovanni di Medua, which is one of the worst ports in European Turkey, and that is saying a very great deal. Scodra is about twenty miles from the sea-coast, and each con-

sulate possesses a postman, who takes it in his turn to ride down to the port to meet the steamer and bring back the mails. When the weather is bad, the boats do not touch at Medua, so the postman has the pleasure of seeing the Lloyd go by to Corfu, and of spending the time at fever-stricken Medua somehow or other till its return. Sometimes there is quite a collection of postmen, who have handed over their mail-bags to the Lloyd agent, and are waiting to receive the post when the steamer does touch. But supposing the gale to moderate sufficiently for this, the difficulties of the postmen are not over. We always talk of the 'road' to Medua, but it is only by courtesy, for, strictly speaking, there is not even a track for the greater part of the way.

In the summer, it is all plain sailing; the boats touch with commendable regularity; the river Drin is low, and the postman ambles along the level banks, or occasionally in the dried-up bed of the stream. But in winter it is a very different thing; the Drin has no respect for its banks, and not content with flooding all the plain, carves out new courses for itself now and then which puzzle the most experienced postman. Sometimes he has to wade, sometimes he has to borrow a *londra* or canoe and paddle across the river; and sometimes he gets intercepted for a week, and the precious mails for which we are longing with the impatience only known to exiles have to be stored in a damp hut, waiting until the rush of waters be past. The postal officials, too, in Europe have vague notions as to our whereabouts. A letter plainly addressed 'Albania' has been sent to America, and returned from Albany, N. Y., with the inscription, 'Try Europe;' and a parcel after having been despatched from England was no more heard of for months, until one fine day a Turkish postman arrived with it safe and sound. It had been sent to Constantinople by a clerk who was too sharp to pay attention to the address, and thence carried across the peninsula by a *zaptieh* at an enormous expense of time and trouble. It is such little *contre-*

temps as these that make us welcome so heartily the solemn face and long grizzled moustaches of Giovanni the postman as he jogs up the road from the bazaar with the mailbags swinging at his saddle-bow.

It is a queer land this : a land of upside-down ; where men wear petticoats and women trousers ; where women ride astride and men ride side-saddle ; where men air themselves in their best clothes, while women do the work and carry the burdens ; a land where justice is quite as blind as she is elsewhere, and quite as frequently pops the innocent man into prison and lets the real offender go free, although she does not disdain to raise a corner of the bandage over her eyes, when the right sort of oil is applied to allay the itching that troubles her palm. But here is a stout little gentleman in the Stambouli uniform, with his fez slightly on the back of his head, and his hands crossed behind him, twiddling a string of amber beads. He is a jovial-looking little man, although he does walk so slowly and solemnly, with his two secretaries or attendants behind him. He represents the blind goddess here, for he is, let us say, the supreme judge of the mercantile court. He is also a Greek, and therefore a plausible and unscrupulous rogue. With what a charming air of old-fashioned courtesy he salutes us ; how politely and even eloquently he discourses of indifferent topics of the day ! In his court he is just as polite ; but the suitors know that it is quite as well to have the judge on their side, and that his taste for antique and curious works of art is rather more expensive than his salary will permit him to gratify ; and so, somehow or other, before an important case comes on, valuable rugs or chased silver ornaments find their way to the judge's house as presents. Should Barbelushi and Skreli go to law, and should Barbelushi, foolishly relying on what he considers the justice of his cause, omit to play a counter-move to the gloriously patterned carpet that has mysteriously found its way from Skreli's house to the President's, he will inevitably lose his case ; the matter is too simple for a moment's doubt. But let us suppose that a friend of Barbelushi informs our little acquaintance that a pistol with a magnificently carved silver butt is awaiting his acceptance, and that only Barbelushi's native modesty has prevented him from offering it long since as a testimony of regard for so upright and learned a judge ; then the matter becomes more complicated, and it requires all the ingenuity and tact of a Greek to see that justice be done.

When the case comes on, the President of the court is even more courteous and affable than usual to the litigants ; he has weighed the matter over well, and has decided, we will say, that he has plenty of carpets for the present ; that Barbelushi's pistol is a very handsome specimen, and that perhaps, by judicious hints, the fellow to

it, which he knows is in existence, may be enticed from Barbelushi's house to his own. When the arguments have been heard, the President and his two colleagues confer over the matter before giving their judgment, and the former speaks very strongly in favour of the justice of Barbelushi's case—so strongly, in fact, that the two colleagues, seeing which way the wind is blowing, and being too wise in their generation to oppose their chief, give their votes for Barbelushi. Thereupon, the President plays a master-stroke, and gives his own vote for Skreli ; but being outvoted, judgment is given for Barbelushi. The latter, rejoiced at winning his suit, returns the judge his most grateful thanks for the eminent justice and skill in the law displayed by His Excellency ; and going home, at once despatches the second pistol as an earnest of his gratitude.

But poor Skreli is naturally much disappointed, and fancies that his carpet is lost for nothing. However, he is too good a fish to be thrown away, so the President takes the first opportunity of condoling with him on his misfortune, and assures him that it was entirely owing to the majority being on the other side ; for that, as the records of the court show, he himself voted for Skreli. And all this is said with so much apparent sympathy, and with so much sorrow that his efforts should have been unavailing, that the simple Skreli is almost consoled for his loss, and goes home resolving that before his next lawsuit a much better carpet shall have become the property of so worthy and upright a judge. And thus all parties are quite satisfied ; and the law, as in other parts of the world, gets the oyster, while the litigants get the shells.

But tricks however cunning get seen through at last, and the judge and his predecessors in office are no doubt largely responsible for that hole in the wall of the house opposite us. The owner of the house evidently does not think his white wall disfigured by the hole, for he has not taken the trouble to plaster it up, though it is probably plugged on the inside to keep out the draught. There are two kinds of justice in this country, and that bullet-hole will serve as the visible sign of one, as the President of the court does of the other. Long before the Ottomans were heard of, the law of the blood-feud and of the responsibility of the family for the misdeeds of all its members, was the only code known ; and as yet the Albanians have not become sufficiently civilised to perceive the advantages of the government method, and so those of them who have not mixed much with Europeans, draw their pistols when they meet an enemy, instead of dragging him before the court. The Mussulmans of the city and the Christians of the mountains go everywhere with pistols and yataghan in their belt ; only the Christians of the city carry no arms. The justice of the law-court is uncertain, expensive, and unsuited to a nation of warriors ; while the blood-feud is honourable, and costs no more than a charge of powder and a bullet, and so the streets and bazaar of Scodra continue to be enlivened by an interchange of shots, whenever the members of families which have blood between them encounter one another.

But the subject is too vast for consideration

at this moment; let us, before we go any further, try to realise what kind of a town it is we are in. For this purpose, the best thing to do is to ascend the low hill just under the castle, for from that point we shall be able to see the country all round us and the city at our feet. Looking out to the north-east, we see a wide plain hemmed in on all sides by lofty mountains; the great Lake of Scodra stretches away from the base of the castle rock to the mountains of Montenegro, the steep cliffs springing directly from the water on its western shore, but with a broad flat plain between the lake and the mountains to the east. Below us lies the city, the wide, low, red-tiled roofs of its houses half hidden by the thick foliage of its trees. Every house stands by itself, shut off from its neighbours by a high wall, and surrounded by its garden, except in the Christian quarter, where the houses are generally smaller, and in many instances without gardens. Here and there is an open space, dotted all over with white tombstones, carved at the top to represent a turban; and from among the trees the tall slender minarets of some thirty mosques shoot up into the air. Nearly in the centre of the town, a red flag marks the Konak or government house and barracks of the troops; while the other flagstaffs that appear above some of the houses near, distinguish the residences of the consuls. To our right, and on the outskirts of the city, stands a huge gaunt building, with no ornament or decoration on its plain plastered walls; this is the Roman Catholic cathedral; and on Sundays and holy-days it is crowded with mountaineers and Christian townsmen.

On a steep rock to our left is the ancient castle, now crumbling into ruin, and shorn of its strength by the proximity of Mount Tarabos, to which modern artillery has given the command of the key of North Albania; and beyond, the Boiana winds slowly through fat lowlands to the sea. Behind us to the south-west is the rich plain of the Zadrima, cut up in every direction by the erratic wanderings of the Drin; and then a range of hills, which hides the Adriatic from our view, and forms the port of San Giovanni di Medua by sending a spur out into the sea. Crushed in between the Boiana and the castle rock is the bazaar, a network of narrow streets, each one of which is devoted to a separate trade. The bazaar serves the men of Scodra instead of a club. Every man has his little shop whether he does any business or not, and there he sits and gossips with his friends, smoking cigarettes and drinking coffee till about half an hour before *Aksham*, when he rises, shuts up his shop, and returns to his house, leaving the bazaar and its wealth to the care of the night-watchers only.

They do things in leisurely fashion at Scodra. There are no startling advertisements, no flaming posters. If a merchant knows you, he will offer you coffee and cigarettes as a matter of course. If you press him, he will show you his goods, but he will not worry you to buy; nay, if he has nothing to your taste, he will tell you of a friend or neighbour who may perhaps be able to supply your wants. He never sells at an alarming sacrifice, nor even considerably under cost price; but what he does sell is thoroughly good, and well worth what he asks for it. It seems incredible at first to a visitor coming from Europe or from Greece;

but Albania is a land of surprises, and therefore, gentle reader, we will note things while they are fresh and strange, and before the novelty has had time to wear off.

THIS MORTAL COIL.

BY GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER XI.—SINK OR SWIM?

HUGH was selfish, heartless, and unscrupulous; but he was not physically a coward, a cur, or a palterer. Without one second's thought, he rushed wildly down to the water's edge, and balancing himself for a plunge, with his hands above his head, on the roots of the big tree, he dived boldly into that wild current, against whose terrific force he had once already struggled so vainly on the morning of his first arrival at Whitestrand. Elsie had had but a few seconds' start of him; with his powerful arms to aid him in the quest, he must surely overtake and save her before she could drown, even in that mad and swirling tidal torrent. He flung himself on the water with all his force, and goaded by remorse, pity, and love—for, after all, he loved her, he loved her—he drew unwonted strength from the internal fires, as he pushed back the fierce flood on either side with arms and thighs of feverish energy. At each strong push, he moved forward apace with the gliding current, and in the course of a few stout strokes he was already many yards on his way seaward from the point at which he had originally started. But his boots and clothes clogged his movements terribly, and his sleeves in particular so impeded his arms that he could hardly use them to any sensible advantage. He felt conscious at once that, under such hampering conditions, it would be impossible to swim for many minutes at a stretch. He must find Elsie and save her almost immediately, or both must go down and drown together.

He wanted nothing more than to drown with her now. 'Elsie, Elsie, my darling Elsie!' he cried aloud on the top of the wave. To lose Elsie was to lose everything. The sea was running high as he neared the bar, and Elsie had disappeared as if by magic. Even in that dark black water on that moonless night he wondered he couldn't catch a single glimpse of her white dress by the reflected starlight. But the truth was, the current had sucked her under—sucked her under wildly with its irresistible force, only to fling her up again, a senseless burden, where sea and river met at last in fierce conflict among the roaring breakers that danced and shivered upon the shallow bar.

He swam about blindly, looking round him on every side through the thick darkness with eager eyes for some glimpse of Elsie's white dress in a stray gleam of starlight; but he saw not a trace of her presence anywhere. Gropping and feeling his way still with numbed limbs, that grew weary and stiff with the frantic effort, he battled on through the gurgling eddy till he reached the breakers on the bar itself. There, his strength proved of no avail—he might as well have tried to stem Niagara. The great waves, rolling their serried line against the stream

from the land, caught him and twisted him about resistlessly, raising him now aloft on their foaming crest, dashing him now down deep in their hollow trough, and then flinging him back again over some great curling mountain of water far on to the current from which he had just emerged with his stout endeavour. For ten minutes or more he struggled madly against those titanic enemies: then his courage and his muscle failed together, and he gave up the unequal contest out of sheer fatigue and physical inability to continue it longer. It was indeed an awful and appalling situation. Alone there in the dark, whirled about by a current that no man could stem, and confronted with a rearing wall of water that no man could face, he threw himself wearily back for a moment at full length, and looked up in his anguish from his floating couch to the cold stars overhead, whose faint light the spray every instant hid from his sight as it showered over him from the curling crests of the great billows beyond him. And it was to this that he had driven poor innocent, trustful, wronged Elsie! the one woman he had ever truly loved! the one woman who, with all the force of a profound nature—profounder ten thousand times than his own—had truly loved him!

Elsie was tossing up and down there just as hopelessly now, no doubt. But Elsie had no pangs of conscience added to torment her. *She* had only a broken heart to reckon with.

He let himself float idly where wind and waves might happen to bear him. There was no help for it: he could swim no farther. It was all over, all over now. Elsie was lost, and for all the rest he cared that moment less than nothing. Winifred! He scorned and hated her very name. He might drown at his ease, for anything he would ever do himself to prevent it. The waves broke over him again and again. He let them burst across his face or limbs, and floated on, without endeavouring to swim or guide himself at all. Would he never sink? Was he to float and float and float like this to all eternity?

Roar—roar—roar on the bar, each roar growing fainter and fainter in his ears. Clearly receding, receding still. The current was carrying him away from it now, and whirling him along in a back eddy, that set strongly south-westward towards the dike of the salt marshes.

He let himself drift wherever it might take him. It took him back, back, back, steadily, till he saw the white crest of the breakers on the ridge extend like a long gray line in the dim distance upon the sea beyond him. He was well into safer water by this time: the estuary was only very rough here. He might swim if he chose. But he did not choose. He cared nothing for life, since Elsie was gone. In a sudden revulsion of wild despair, a frantic burst of hopeless yearning, he knew, for the first time in his whole life, now it was too late, how truly and deeply and intensely he had loved her. As truly and deeply as he was capable of loving anybody or anything on earth except himself; and that, after all, was nothing much to boast of.

Still, it was enough to overwhelm him for the moment with agonies of remorse and regret and

pity, and to make him long just then and there for instant death, as the easiest escape from his own angry and accusing conscience. He wanted to die; he yearned and prayed for it. But death obstinately refused to come to his aid. He turned himself round on his face now, and striking out just once with his wearied thighs, gazed away blankly towards the foam on the bar, where Elsie's body must still be tossing in a horrible ghastly dance of death among the careering breakers.

As he looked, a gleam of ruddy light showed for a second from a masthead just beyond the bar. A smack—a smack! coming in to the river! The sight refilled him with a faint fresh hope. That hope was too like despair; but still it was something. He swam out once more with the spasmodic energy of utter despondency. The smack might still be in time to save Elsie! He would make his way out to it, though it ran him down; if it ran him down, so much the better! he would shout aloud at the top of his voice, to out-roar the breakers: 'A lady is drowning! Save her!—save her!'

He struck out again with mad haste through the back current. This time, he had to fight against it with his wearied limbs, and to plough his way by prodigious efforts. The current was stronger, now he came to face it, than he had at all imagined when he merely let himself drift on its surface. Battling with all his might against the fierce swirls, he hardly seemed to make any headway at all through the angry water. His strength was almost all used up now; he could scarcely last till he reached the smack.—Great heavens, what was this? She was turning!—she was turning! The surf was too much for her timbers to endure. She couldn't make the mouth of the creek. She was luffing seaward again, and it was all up, all up with Elsie.

It was Warren Relf's yawl, bearing down from Lowestoft, and trying for the first time to enter the river through the wall of breakers.

Oh, if only he had lain right in her path just then, as she rode over the waves, that she might run him down and sink him for ever, with his weight of infamy, beneath those curling billows! He could never endure to go ashore again—and to feel that he had virtually murdered Elsie.

Elsie, Elsie, poor murdered Elsie! He should hate to live, now he had murdered Elsie!

And then, as he battled still fiercely with the tide, in a flash of his nerves, he felt suddenly a wild spasm of pain seize on both his thighs, and an utter disablement affect his entire faculty of bodily motion. It was a paroxysm of cramp—overwhelming—inexpressible—and it left him in one second powerless to move or think or act or plan, a mere dead log, incapable of anything but a cry of pain, and helpless as a baby in the midst of that cruel and unheeding eddy.

He flung himself back for dead on the water once more. A choking sensation seized hold of his senses. The sea was pouring in at his nostrils and his ears. He knew he was going, and he was glad to know it. He would rather die than live with that burden of guilt upon his black soul. The waves washed over his face in serried ranks. He didn't mind: he didn't struggle; he didn't try for one instant to save himself. He

floated on, unconscious at last, back, slowly back, towards the bank of the salt marsh.

When Hugh Massinger next knew anything, he was dimly conscious of lying at full length on a very cold bed, and fumbling with his fingers to pull the bed-clothes closer around him. But there were no bed-clothes, and everything about was soaking wet. He must be stretched in a pool of water, he thought—so damp it was all round to the touch—with a soft mattress or couch spread beneath him. He put out his hands to feel the mattress. He came upon mud, mud, deep layers of mud; all cold and slimy in the dusk of night. And then with a flash he remembered all—Elsie dead! Elsie drowned!—and knew he was stranded by the ebbing tide on the edge of the embankment. No hope of helping Elsie now. With a violent effort, he roused himself to consciousness, and crawled feebly on his knees to the firm ground. It was difficult work, floundering through the mud, with his numb limbs; but he floundered on, upon hands and feet, till he reached the shore, and stood at last, dripping with brine and crusted with soft slimy tidal ooze, on the broad bank of the moated dike that hemmed in the salt marshes from the mud-bank of the estuary. It was still dark night, but the moon had risen. He could hardly say what the time might be, for his watch had stopped, of course, by immersion in the water; but he roughly guessed, by the look of the stars, it was somewhere about half-past ten. We have a vague sense of the lapse of time even during sleep or other unconscious states; and Hugh was certain he couldn't have been floating for much more than an hour or thereabouts.

He gazed around him vaguely at the misty meadows. He was a mile or more from the village inn. The estuary, with its acrid flats of mud, lay between him and the hard at White-strand. Sheets of white surf still shimmered dimly on the bar far out to sea. And Elsie was lost—lost to him irrevocably.

He sat down and pondered on the bank for a while. Those five minutes were the turning-point of his life. What should he do and how comport himself under these sudden and awful and unexpected circumstances? Dazed as he was, he saw even then the full horror of the dilemma that hedged him in. Awe and shame brought him back with a rush to reason. If he went home and told the whole horrid truth, everybody would say he was Elsie's murderer. Perhaps they would even suggest that he pushed her in—to get rid of her. He dared not tell it; he dared not face it. Should he fly the village—the county—the country?—That would be foolish and precipitate indeed, not to say wicked: a criminal surrender. All was not lost, though Elsie was lost to him. In his calmer mood, no longer heroic with the throes of despondency, sitting shivering there with cold in the keen breeze, between his dripping clothes, upon the bare swept bank, he said to himself many times over that all was not lost; he might still go back—and marry Winifred.

Hideous — horrible — ghastly — inhuman: he reckoned even so his chances with Winifred.

The shrewd wind blew chill upon his wet clothes. It bellowed and roared with hoarse

groans round the stakes on the dike-slucies. His head was whirling still with asphyxia and numbness. He felt hardly in a condition to think or reason. But this was a crisis, a life-and-death crisis. He must pull himself together like a man, and work it all out, his doubtful course for the next three hours, or else sink for ever in a sea of obloquy, remembered only as Elsie's murderer. Everything was at stake for him—live or die. Should he jump once more into the cold wild stream—or go home quietly like a sensible man, and play his hand out to marry Winifred?

If he meant to go, he must go at once. It was no use to think of delaying or shilly-shallying. By eleven o'clock, the inn would be closed. He must steal in, unperceived, by the open French windows before eleven, if he intended still to keep the game going. But he must have his plan of action definitely mapped out none the less beforehand; and to map it out, he must wait a moment still; he must sum up chances in this desperate emergency.

Life is a calculus of varying probabilities. Was it likely he had been perceived at the Hall that evening? Did anybody know he had been walking with Elsie?

He fancied not—he believed not.—He was certain not, now he came to think of it. Thank Heaven, he had made the appointment verbally. If he'd written a note, that damning evidence might have been produced against him at the coroner's inquest. Inquest? Unless they found the body—Elsie's body—pah! how horrible to think of—but still, a man must steel himself to face facts, however ghastly and however horrible. Unless they found the body, then, there would be no inquest; and if only things were managed well and cleverly, there needn't even be any inquiry. Unless they found the body—Elsie's body!—poor Elsie's body, whirled about by the waves!—But they would never find it—they would never find it. The current had sucked it under at once, and carried it away careering madly to the sea. It would toss and whirl on the breakers for a while, and then sink unseen to the fathomless abysses of the German Ocean.

He hated himself for thinking all this—with Elsie drowned—or not yet drowned even—and yet he thought it, because he was not man enough to face the alternative.

Had Elsie told any one she was going to meet him? No; she wouldn't even tell Winifred of that, he was sure. She met him there often by appointment, it was true, but always quietly: they kept their meetings a profound secret between them.

Had any one seen them that evening together? He couldn't remember noticing anybody.—How shrill the wind blew through his dripping clothes. It cut him in two; and his head reeled still.—No; nobody, nobody. He was quite safe upon that score at least. Nobody knew he was out with Elsie.

Could he go back, then, and keep it all quiet, saying nothing himself, but leaving the world to form its own conclusions? A sudden thought flashed in an intuitive moment across his brain. A Plan!—a Plan! How happy! A Policy! He saw his way out of it all at once. He could set everything right by a simple method. Yes, that would do. It was bold, but not risky. He

might go now : the scheme for the future was all matured. Nobody need ever suspect anything. A capital idea ! Honour was saved ; and he might still go back and marry Winifred.

Elsie dead ! Elsie drowned ! The world lost, and his life a blank ! But he might still go back and marry Winifred.

He rose, and shook himself in the wind like a dog. The Plan was growing more definite and rounded in his mind each moment. He turned his face slowly towards the lights at Whitestrand. The estuary spread between him and them with its wide mud-flats. Cold and tired as he was, he must make at all speed for the point where it narrowed into the running stream near Snade meadows. He must swim the river there, with what legs he had left, and cross to the village. There was no time to be lost. It was neck or nothing. At all hazards, he must do his best to reach the inn before the doors were shut and locked at eleven.

When he left the spot where he had been tossed ashore, his idea for the future was fully worked out. He ran along the bank with eager haste in the direction of Whitestrand. Once only did he turn and look behind him. A ship's light gleamed feebly in the offing across the angry sea. She was beating up against a headwind to catch the breeze outside towards Lowestoft or Yarmouth.

WALES AS A GOLD-FIELD.

THOUGH gold is well known to be a widely distributed metal, being found in greater or less abundance in almost every part of the globe, we have for so long been accustomed to look upon California, Australia, and the Transvaal as the principal countries in which it occurs in quantity, that when the announcement was made a few months ago that it existed plentifully within the limits of our own island, the statement was received with some amount of incredulity. Geologists have for some time been aware that Wales, like other parts of the United Kingdom, contained gold, and mines have from time to time been worked, but the fact that they were eventually abandoned, naturally led to the inference that no profit was derived from them. Hence the disbelief in the recent statement respecting the abundance of gold found there.

Without going so far as to say, as some have assumed, that the gold ornaments worn by the ancient Britons were manufactured from Welsh metal, and that the Romans wrought gold in the Principality, it is certain that in the sixteenth century Thomas Bushell rented royal mines of Charles I. both in Merionethshire and Cardiganshire ; and in 1636 he was permitted to erect a mint at Aberystwith, ostensibly for the purpose of coining his Cardiganshire silver. It is asserted that he lent his sovereign treasure equal to two million pounds ; and as he only accounted for little more than one two-hundredth part of this in silver coinage, the probabilities are that he worked up a large amount of gold found in the district ; and in support of this conjecture it may be mentioned that a number of silver and gold coins have been found in the neighbourhood of Dolgelly which bear the Welsh plume on the obverse, and frequently in triplicate on the reverse—a symbol

which might not only indicate where the coin was struck, but might denote that the metal was of Welsh origin, just as the letters 'SS' on some of the silver money of George I. signify that the metal came from the South Seas during the existence of the famous 'bubble.' We are thus forced to the almost inevitable conclusion that two centuries ago gold was worked in the Principality. For the past fifty years its existence there has been a matter of common knowledge, as in 1844 a paper on the subject was read before the British Association ; and since then, various scientists have dealt with the question of Wales as a gold-producing district, samples of quartz containing the precious metal have been exhibited, and mining has been undertaken. But hitherto, the bulk of the operations have not realised the expectations of their promoters, and the majority of them have been abandoned. That some of these workings were commenced under the most promising auspices, and for a time proved profitable, there can be no doubt ; for it is a fact that between 1860-65, the Yigra and Clogau Mine, which is situated in the neighbourhood of the recent discoveries, yielded some sixty thousand pounds-worth of gold, the greater portion of which was purchased by the Bank of England. But, nevertheless, these workings were eventually closed, though, whether this was due to lack of management in the method of carrying on the operations, or arose from the yield of produce decreasing until it was insufficient to compensate the shareholders for their outlay, is a moot question.

With these facts before them, it can hardly be wondered that the British public received with some degree of hesitancy the announcement made a little while ago that in Wales are gold-fields exceeding in richness those of Australia. The statement, however, appears to have been made in all sincerity ; and to Mr Pritchard Morgan, of Dolgelly, a gentleman who has had a long connection with gold-mining at the antipodes, must be accorded the credit of having made the discovery. The district in which the gold-bearing quartz has been found is the valley of the Mawddach, in that most mountainous of Welsh counties, Merionethshire, and is some fifty square miles in extent. To tourists it is well known by reason of its great picturesqueness. In this locality it is stated that hundreds of quartz lodes are cropping out at the surface, and most of them are auriferous. From stone already obtained by Mr Morgan and tested, the yield of gold varies from about two to six ounces per ton. Assuming that the quartz contains an average of two ounces per ton, it is quite clear that the profits must be enormous, because a mine producing only one-thirteenth of that quantity has been known to pay. In the colony of Victoria there were crushed 876,692 tons of quartz in 1884, and 843,251 tons in 1885, the average yield per ton of the former being 9 dwts. 21·07 grs. ; and of the latter, 10 dwts. 1·28 grs.

It would thus appear that the Welsh gold-field is four times as fruitful as that of Victoria. But before we accept this as a definite conclusion, we must bear in mind that though gold exists in many parts of Wales, it occurs in what are known as 'bunches ;' that is, it is not evenly distributed, and the quantity of metal obtained from one ton of quartz is no guide

as to what will be the yield of the next hundred tons; it is quite possible that they may be crushed and give practically no return. The result of assays of small samples of stone from various parts of the lode, it is therefore quite clear, can give no accurate idea of the general yield; and in large mining operations it is the average amount of produce which determines the success or failure of the undertaking. Now, as to the yield of Welsh mines, in some score of which gold has been found in past days. Of these workings it is alleged that only five were tested on a practical scale, and from them were obtained 12,137 tons of mineral, which produced 14,667 ounces of gold, or an average of an ounce and a quarter per ton. As to the prospect of the Merionethshire gold-fields, in a paper read by Mr T. A. Readwin, F.G.S., at a meeting of the Geologists' Association the other day, he said that for gold especially he had assayed more than a thousand specimens of mineral from the valley of the Mawddach, and only fourteen of them gave a negative result. In those samples in which gold was found, the amount varied from five pennyweights to as many ounces per ton; and he added, that to his own knowledge there were fifty places in the district where he could go and find gold visible to the naked eye.

If these figures and statements were relied upon alone, what a vast amount of wealth we should naturally be led to conclude lay buried in the Welsh hills—fifty square miles of gold-bearing quartz!—and that at a time when we hear complaints of trade depression and low wages on every hand. With such extensive riches in our own land, why, we are inclined to ask, should so great a proportion of our working-class population be compelled to emigrate, and why such complaining in our streets? Should not the obtaining of this golden treasure in the Principality afford employment to many of those who daily leave our shores to earn their livelihood on foreign soil? Stay; let us not too readily accept golden prospects! We must remember that some two decades ago large sums were expended in gold-mining in the very valley in which so much wealth is now said to lie. There was plenty of quartz, the assays of which gave yields of gold exceeding the average of some of the best paying mines in Australia and America. Everything pointed to success; but, alas, the assays proved quite delusive, and the brilliant hopes which had been indulged in respecting the future of Wales were ruthlessly shattered, for the whole thing turned out a complete failure. It was one more of those gloomy chapters so abundant in the history of gold-mining, and which we find furnished by countries where experience has proved, much more certainly than it has in the Principality at present, that gold exists in quantities which will pay for working it. We know that there is abundance of the precious metal in the Transvaal, and large amounts of it are found in Queensland; but in each country may be pointed out mines which were commenced with the most promising prospects and ended in failure.

Of course, we know that nothing is more uncertain than prospecting for the valuable metals, for instances of this we have had times out of number in the gold-digging history of California, Australia, and other countries. A person may

find gold, but in insufficient quantity to yield a remunerative return for the outlay, and after working for a time he abandons the task. A short distance away another individual may strike a lode which leads to a speedy fortune. It is just possible, therefore, that though the valley of the Mawddach has been more than once prospected for gold, but without any ultimate benefit, Mr Morgan may have had the good luck to find lodes whose existence has hitherto been unknown and whose yield of gold may pay for the working.

Within recent years, improvements have been effected in the methods adopted for extracting the precious metal from the ore, and it may happen that—notwithstanding the previous failures of the Welsh gold-field—should Mr Morgan's estimate of the average yield of metal per ton fall far short of his anticipations, these improvements may make all the difference between success and the reverse; for nowadays, as we have already shown, it is quite possible to derive a profit from a mine which produces only three pennyweights of gold to the ton. As Mr Morgan calculates that he will obtain an average yield of two ounces per ton, an ample margin is left for contingencies. And Mr Morgan is not the only gentleman who entertains sanguine views as to the future of gold-mining in the Principality. Mr Berger Spence, the well-known metallurgist, has procured and assayed samples of the ore from an area of twenty-five to thirty square miles, and the result is such that he sees no reason to doubt that, if the lodes are worked systematically and scientifically, the district may become one of the most important of its kind in the world, and give employment to a great number of people. Again, Mr Readwin in the paper already alluded to says: 'Allow me to express my great regret that the public have got into such a state of unrest about Welsh gold, and that so much rubbish has got into the newspapers thereupon. Of course, some people are more sagacious than others, and can see through a mountain as easily as spiritualists do, and can study a difficult district right well in a couple of hours or thereabouts, and report accordingly. But notwithstanding recent exaggerations as to the gold at Gwynfynydd, there certainly exists plenty of it; and I believe that old Yigra and Clogau, the Prince of Wales, Cefncoch, Bernllwydd, Cefndenddw, and other mines, are destined in the near future to yield on large quantities nearly an ounce of gold to the ton of mineral.' Opinions from gentlemen of so high standing are entitled to every consideration, and none will be found to hope other than that their expectations may be realised to the full. Should their anticipations be verified, Mr Morgan's discovery will become of national importance; for not only may we expect an immense revival of trade and contentment among the working classes, but he has promised, after providing for the wants of himself and family, to devote the surplus profits to the reduction of that burden on the state, the decreasing of which has proved such a bugbear to so many of our chancellors of the exchequer—the national debt.

Gold-fields have ever had an attraction for the human race, and signs are not wanting that the usual 'gold-fever' is setting in in Wales; but notwithstanding the rosy views which some are inclined to take, it would be well to remember

the past history of the Principality in this respect, and wait until the success of the new discovery is assured, before old mines are reopened and capital is sunk in boring the Welsh hills for what may prove only a phantom.

IN DANGER'S WAY: A TALE OF TWO HEROES.

IN FIVE CHAPTERS.

By THOMAS ST E. HAKE.

CHAPTER I.—PICKED UP AT SEA.

A LIGHT sailing-boat, with a young seaman in the stern, glided from behind a screen of rocks which formed the projecting angle of a tall cliff. A small black object immediately in the boat's course—an object that was sometimes hidden by the intervening waves—had attracted the sailor's attention; he was steering directly for the spot; and his sunburnt, muscular arm, bared to the elbow, was outstretched, ready for the plunge as he passed. Weather-beaten and broad-shouldered, this seaman had a slightly foreign appearance—something of the Dutchman in his square features; and yet it was a kindly face, though the mouth was a shade severe, and the eyes semi-savage in expression, dark, and searching as a heron's. It became apparent, before the boat was alongside, that the object was only a black bottle; but the sailor presently had it in his grasp, and was examining it with a puzzled look. It was seemingly empty, but tightly corked. He held it up between the dazzling sunlight and his keen bright eyes. No—not empty; something solid and opaque, like folds of paper, became visible in dark outline. He instantly knocked off the neck with his clasp-knife, and slowly drew out a parchment scroll. It was perfectly dry. The centre was tied round with a piece of tarred twine, and a rough seal secured each end. Turning it about with curiosity, the sailor noticed, written across the scroll in quaint characters: 'Cora Norland, Southsea Bay, England.'

He looked intently seaward, as if for some clue, and then again at the scroll. 'Why, it's—surely it must be—Abel Honywood's handwriting. His ship is lost, and he'—the sailor glanced about despairingly—'can he be drowned?' In his excitement he placed his hand upon the string, as if to loosen it; but he stopped abruptly. 'No; Max Von Roïn; it's not addressed to you.' He spoke to himself persuasively. 'It's to Cora Norland. Deliver it into her own pretty hands, and without delay, as in duty bound.'

No sooner said, than he placed the scroll in his breast-pocket, buttoned his pea-jacket emphatically round his broad chest, and then began to alter his course. He steered at an angle to seaward against wind and tide, and then again changed the direction, tacking with great dexterity towards the cliff; and his boat cut through the water with such a bend, now on its starboard, and now on its larboard side, that it appeared in imminent danger of being capsized.

In less than an hour's time, for the tide presently began to turn, Max Von Roïn came in sight of a small sandy bay. A town of considerable extent stood in the background; and on the cliff under which he was passing, there were

several handsome villas; some of them had irregular flights of steps cut in the limestone which led from gardens down to the beach. At the other end of the bay there was a harbour with a lighthouse on the jetty outside. The harbour was crowded with craft of all shapes and sizes; and the sailor, although keeping on his tacking course, was evidently steering for the entrance to this port.

There was something decidedly picturesque about the little bay, with its numerous fishing-boats lying high and dry upon the sand—boats newly painted, and boats from which all vestige of paint had been effaced by time and tide; and there was something cheering in the sight of children romping about on the beach, where their laughter found an accompaniment in every wave that broke at their feet. But could this be the sailor's only reason for gazing so intently towards the shore? This sandy bay had been his playground in boyhood; was that why he looked so lovingly towards it now?

Along the sand, at the edge of the waves, a young girl was advancing slowly towards the cliff. She apparently took no notice of Max Von Roïn's boat; she was too occupied with her own reflections for that. But she sometimes stopped to trace figures on the sand. Could she be unaware of the boat's proximity? No skiff ever laboured harder to attract attention. It was running headlong towards the shore, as if bent upon landing its occupant at the girl's feet. But suddenly, with a flutter of the sail, it altered its track, and turned directly seaward, as though driven away by despair.

When the sailor had reached the entrance to the harbour, he looked back. There was the girl standing on a flight of steps which led to one of the villas; she was watching the boat: nothing could be more evident to the keen-sighted seaman. But next moment the boat had run into the harbour, and the jetty intervening, hid the figure from sight.

The boat approached a bulky ship lying alongside the quay—one of that ancient type of wooden craft which have traded between England and the ports of the North Sea for centuries past. A little old mariner, with a wrinkled face and small twinkling eyes, walked up and down the broad deck. He was enveloped in a thick rough jacket—though it was a bright summer day—and he wore a fur cap, which was pulled down over his forehead until it almost touched his thick white eyebrows. He leaned over the bulwark as the sailor's boat approached, and looked down. 'Why, Max,' said he, 'what cheer, my lad?'

The sailor attached his boat to the ship's side and began to climb up the rope-ladder. 'I've changed my mind: I've business with—' with Mr Norland. It won't bear delay. So, captain, I've come back.'

The captain took another turn up and down the planks; then he stopped, beckoned to the sailor, and went below. 'Max Von Roïn,' said he, seating himself at the head of a long table in the centre of his cabin, 'sit down.'

The cabin, like many on board these vessels, closely resembled the cosy bar-parlour of an old inn. The sides and ceiling were panelled with polished oaken boards. Max Von Roïn

sat down on the locker between two round windows, like staring eyes, facing a horse-hair sofa which filled up a recess, and waited in silence for the mariner to speak. The captain lit a huge meerschau pipe, a pipe with a long wooden stem and a green silken tassel, and after one or two vigorous whiffs—'Max,' said he, 'I'm a man of few words. It's about Cora Norland—isn't it?'

Max Von Roïn, who was staring up at the skylight, where a large brass compass was hanging like a lamp, made no reply; he knit his brow and folded his arms defiantly.

The captain looked at him with a keen and severe eye. 'Don't forget, Max, that I'm your captain.'

The sailor's expression softened. 'I beg your pardon, Captain Satchell. But am I, because I'm mate on board your ship, bound to answer that question?'

'No,' said the captain promptly—'not if you think, my lad, that I ask out of idle curiosity—by no means.'

Max Von Roïn's manner changed. 'You're right, captain,' said he with frankness. 'Why shouldn't I tell you? It is about Cora Norland.'

'Ah! I thought nothing else could 'a brought you back,' said the captain, winking at the bowl of his meerschau. 'Now, look here, Max,' he continued. 'You take my advice; get back into your boat. The tide's on the turn, but the wind's to leeward. Ain't it?'

The young sailor looked perplexed. 'Not go to Mr Norland's?'

'No; not one step. You'll get into trouble, Von Roïn, if you do. You must know—or ought—that Mr Norland means to marry his daughter to Stephen Walsh. He's a gentleman'

'That's a matter of opinion,' interrupted Von Roïn.

'A gentleman, Max, by birth. And he's rich enough,' added the captain, 'to keep his yacht. He loves the girl'

'Loves Cora Norland? He loves her father's money.'

Captain Satchell stamped his foot impatiently. 'What business is that of yours? What I wish to convey is this,' he said with emphasis: 'you might as well ask Mr Norland for the full-moon as ask him to let you marry his daughter.—Now, do you understand?' And the captain blew great puffs of smoke from his lips, which almost hid him from sight.

A flash of passion shot from Max Von Roïn's dark eyes. 'Did I even hint that I had any intention of asking Mr Norland for his daughter?'

The wrinkles on the captain's face, as the cloud dispersed, gathered in laughter about his mouth. 'You're mighty mysterious,' said he.

The young sailor slowly unbuttoned his pea-jacket, took the scroll from his pocket, and handed it to the captain. 'This,' said he, 'is what has brought me back; and he explained how it had come into his possession.'

'Ay,' said the captain, after carefully examining the superscription, 'that's Abel Honeywood's handwriting sure enough! What can this be about?'

Max Von Roïn, after a thoughtful pause, said: 'He loved Cora Norland. You knew that?'

'Ay; but she never cared for him.'

'Did she—does she even now—care for any one?' said Max Von Roïn meditatively.

Captain Satchell handed him back the scroll. 'Take it to her; perhaps it's a talisman; and he looked keenly into the young sailor's face.

Von Roïn made no reply. He stepped quickly towards the cabin door. As he went out, he glanced back. The captain was puffing thoughtfully at his pipe and looking vacantly through the cabin window. There were tears in his eyes.

'He's thinking of Abel Honeywood,' said the young man as he leaped ashore.

Max Von Roïn hastened across the bay, at the edge of the sea, towards Mr Norland's villa; and as he went along, the impress of little heels and soles on the sand reminded him—if that were needed—of the pretty figure he had seen there half an hour ago. A resolute, almost dogged expression came into his face; he loved Cora Norland passionately, and he was determined to make her his wife.

He was conscious of great obstacles: they would have disheartened most men. Mr Norland was a wealthy shipowner; and Max Von Roïn, although qualified for taking the command of a vessel, had only a distant prospect of getting promoted. In the meantime his rich rival, Stephen Walsh, was constantly cruising in these waters. His yacht, with the flag fluttering at the mast-head, was lying in the harbour to-day; and Max Von Roïn made no doubt that the owner of this little craft was up at the villa, and probably courting the girl whose very footprints along the sandy bay he could not look upon without emotion.

Suddenly the young sailor stopped. At his feet, traced in the sand, was the simple word 'Cora.' It was the word which filled his heart, and he looked at it long and dreamily. Had she not written it there while he was tacking towards the harbour? It was as though the waves had whispered to her that her name was on his lips. And yet she had not looked up or given him the slightest sign that his presence was known to her. She had let him pass by unnoticed. Had she feared that a glance would bring his boat too near the beach? He gazed intently at the word, as if he thought that this simple action on the girl's part contained some hidden meaning; and while he gazed, a wave came dancing over other waves and broke noisily upon the sands. Next moment the word 'Cora' was blotted out.

On the terrace, in front of the villa, stood Cora Norland. The red glow of sunset, reflected over a wide area of sea and sky, lit up her face. Her eyes were turned with intense interest towards Max Von Roïn. She had seen him stop opposite her name and stare at it until the wave came and washed it away; and now she saw him mounting the rugged steps in the cliff which led through a gateway into the grounds. A generous impulse seized her. She had behaved rudely to the young sailor; she had turned her back upon him when he came towards the shore in his boat. Cora stepped forward, opened the gate and held out her hand, and said: 'Am I forgiven?'

Max Von Roïn looked perplexedly into her face; but he took the hand without hesitation. Was a prettier or softer hand, he thought, ever placed in a rough sunburnt hand like his?

'I saw your boat,' said the girl, 'though I pretended I didn't. I was angry,' and she knit her pretty brow and flashed her brown eyes at him pitilessly. She had never seemed to him so beautiful. She might knit her brow and flash her eyes as often as it pleased her, if she would only love him!

All that Max Von Roûn could answer was: 'Angry, Cora, with me?'

'Yes. You have not been to see us since the *Loadstar* came into port. Haven't you been here nearly a week?'

'Five days. We have been so busy unloading.'

Cora smiled incredulously. 'You found time for a sail this afternoon.'

'I was going to Shingle Point.'

'Then why,' was Cora's natural question—'why have you come back?'

Max Von Roûn looked at her earnestly and said: 'To see you.'

The colour spread over Cora's cheeks, and she bent her head. Was the girl a coquette, thought the sailor, or was this a genuine expression of embarrassment? He had known her since childhood; he had been her playmate in days gone by upon the sands of Southsea Bay. As her puzzling ways had distressed him then, so they distressed him now.

'Something strange,' said he, 'has happened. News has come—at last—from Captain Honywood.' And Max Von Roûn, while handing her the scroll, told her how he had chanced to come by it.

Cora's face became troubled. She looked up and said in an unsteady voice: 'Do you think his ship the *Cora* is really lost?'

Max Von Roûn bowed his head. 'Yes; I fear that Abel Honywood and all his crew are drowned.'

The girl turned the scroll over in her fingers hesitatingly. 'I dread to open it,' said she, in a hushed voice. 'I will take it to father; he shall break the seals.' And Cora ran across the terrace and disappeared through an open side-door.

Max Von Roûn sat down upon a garden-bench to await Cora's return.

Mr Norland, who was writing at his desk, looked up with surprise as Cora entered the study. The girl stopped, out of breath, at the door. She had forgotten in her haste that her father had given strict orders that when at work he should never be disturbed. 'Run away—I'm busy,' said he, and went on writing.

The shipowner had a stern face; and at a first glance, one would have pronounced him a character resentful when contradicted. He had an iron will—an energy and purpose that made him feared. Such men often conceal a fine heart, through a morbid dislike to sentiment, by their blunt manner. Mr Norland belonged to this type. He had begun life as a common sailor; but he had early become captain and part proprietor of a brig. He now owned—after nearly fifty years of hard work—a little fleet, which traded between Southsea Bay, Holland, and the north-west coast of France.

'Are you very busy?'

Again Mr Norland looked up; this time he threw down his pen angrily and leaned back in his chair. 'What's amiss?'

Cora's face was flushed and agitated. 'I've

heard bad news—at least, I'm afraid it's bad; something tells me it must be. Will you open this and see?'

'What's it all about?'

He took the scroll from her somewhat roughly. 'Dear me!' he cried, suddenly starting up from his seat; 'it's from Honywood.'

'Yes, father. That's what Max Von Roûn says.' And she told him how the young sailor had picked up the scroll and brought it to her. 'Will you open it?'

The shipowner scarcely needed asking. He hastily took a penknife from his desk, cut the string and broke the seals; then he flattened out the scroll and began to read. Cora stood by, with clasped hands, looking over his shoulder.

'When these lines reach you, dear Miss Cora, I shall be no more; for I will never part with this letter, which I am now writing to you, while there is hope. I am naturally superstitious, as you know; and I've got a terrible presentiment that this is to be my last voyage; so I take up my pen in order to confess something that I can never tell you by word of mouth. I love you—I love you—indeed, I do—as no one ever loved. Do you love me?—No. But you would, mark my words, had I steered safely into Southsea Bay. And I will now state, briefly, why I believe this. When I reached Rotterdam, I found a letter from a firm of lawyers at Riga. From this letter I learnt that my old godfather, the Russian officer, had been killed at Plevna, and that I was his heir; and that if I went to the Bank at Rotterdam, I should find a parcel addressed to me by him. This parcel, as I discovered upon opening it, contained a small tin box; and in this box I found a magnificent diamond, oval in shape, and as big as a split walnut. A document, placed beneath it in the box, informed me how it came into my godfather's possession. It was given to him by a Russian princess whose life he had saved; and she had told him that there was a tradition in her family that he who owned it could never fail to win the heart of the woman he loved.

ABEL HONYWOOD.'

That was all. There was no message to Mr Norland, to whom the *Cora* belonged. The letter was evidently written, as it implied, before any actual warning of danger had reached the captain. When the fatality occurred, there could have been no time—at least so the shipowner conjectured—for composing such a neat letter as this was.

'The *Cora* is lost,' said he confidently. 'This removes all doubt. They're all drowned. Poor fellows!' His face became deeply careworn. He began to pace up and down the study, as though he were on board ship; and the expression in his keen gray eyes suggested a vision of breakers ahead. The letter had dropped from his hand upon the floor. Cora picked it up without a word. She understood her father. His thoughts were far away with a doomed ship, out in the storm, where the planks strained and creaked and the wind whistled in the rigging; where the waves rolled high, flinging clouds of spray into the brave faces of desperate seamen! For Mr Norland knew from experience what it was to suffer shipwreck, and the news of any catastrophe at sea always roused his sympathy. He was a sailor to the backbone.

Cora went out, leaving her father to 'pace the

deck,' as she called it, and hurried to rejoin Max Von Rönin. As she came out upon the terrace she saw that he was not alone; seated on the gate, with his arms folded somewhat defiantly, was a young man in yachting costume. He had a handsome enough face and a fine athletic appearance; but there was an expression in his eyes, an evident distaste to look at any one steadfastly, that had the effect of prejudicing many against him.

'You look distressed, Miss Norland.' He sprang from the gate and stepped forward to greet her. 'No bad news, I hope?'

Cora glanced at Von Rönin. He was seated on the bench with his hands plunged into the pockets of his rough pea-jacket.

'Haven't you told Mr Walsh?'

'No,' said the sailor shortly.

'He merely mentioned,' said Walsh, 'that you had gone indoors to speak to your father.—Max Von Rönin,' the young fellow added with a laugh, 'takes after his captain. He's a man of few words.—Ain't you, Max?'

Von Rönin flashed an angry glance at the speaker. 'There are some men,' said he, 'that I would not talk to at all, if I had the choice.' And he got up, as though to take his leave.

'You are not going?' said Cora. 'Stay a moment. I want to show this to you—this letter from poor Abel Honeywood. You brought it to me; and it is only fair—for I've no wish to keep the contents a secret—that you should be among the first to read it.' So saying, she handed him the scroll, and they sat down side by side on the bench.

'Read it aloud,' added Cora in an earnest voice; 'I wish Mr Walsh to hear it too.'

Stephen Walsh resumed his place on the little three-bar gate. He looked somewhat disconcerted; and although he again folded his arms, there was no longer the same air of assurance in his manner. 'What is this about Abel Honeywood?' asked he. 'Listen,' replied Cora. 'This letter will explain.'

TO THE BOTTOM OF THE CHANNEL TUNNEL.

It was on a fine warm afternoon in July when my friend and I reached Dover, armed with the highly valued authority to pay a visit to the Channel Tunnel works on the following morning. The weather had been decidedly sultry, and London, as usual, was unpleasantly close and stuffy, so that the prospect of a couple of days of sea-air was in every way welcome; but when it also included the prospect of an adventure such as we were about to undertake, our feelings as geologists were particularly pleasing and happy ones.

Having fixed on our hotel, we sauntered on to the Admiralty Pier to watch the landing of passengers from the mail-packet which was rapidly approaching from Calais. Soon she came alongside, and with remarkable promptitude was secured and her passengers landed; indeed, there is perhaps no place in the world where such rapid transits of passengers and their effects take place as on this through-continental route. On this fine afternoon all was cheerful and bright, far different from what we had often seen, when

the boats could hardly get to their landing-stage, when not a dry plank could be seen, and when the unfortunate passengers had undergone an hour, or perhaps two, of as nasty a bit of tossing about as can be found round our coasts. As we watched the two trains slowly move off the pier Londonwards, we thought to ourselves, what will be the result if ever this Tunnel is completed? Will it draw two nations into closer unity, or will it give rise to unnecessary alarms and mistrust? Will it do away altogether with the splendid mail-packets which put to sea in weather that would almost wreck a rather less powerful boat? Or will it, after all, be such an unpleasant idea to travel twenty-six miles under the bed of the sea in a narrow tube, that most passengers will prefer the packet and fresh air in spite of seasickness?

After dinner we had a look round the town. Dover is always interesting with its pier and harbour, castle and heights. The Romans discovered the value of the site of Dover Castle, as the remains of their old *pharos* testify. No doubt we took the hint and built the castle close by. It is well worth a visit with its towers and armoury.—But we must return to our hotel, for we have a good day's work before us to-morrow.

Next morning we were up with the lark; and after breakfast, proceeded to the station and presented one of our letters of introduction, which produced for us a courteous request to wait a short time whilst an engine was being got ready to take us to the workings, if we did not object to that mode of travelling. Of course we did not, for there is nothing we enjoy better than travelling in this way, provided the weather be fine. In a few minutes our engine came up, and we mounted, and were soon off. As the works are situated on the Folkestone side of the celebrated Shakespeare Cliff, we had to go through the long tunnel which pierces it. The effect was most weird; we were in total darkness, whilst the roar of noise was so great that I could not make my friend hear, although I shouted as loudly as I could. Presently, the engine-driver—in order to produce a startling effect, I suppose—opened the stoke-hole door, and the lurid glare was just enough to show that there were still four of us on the engine. All around us was inky black; whilst we four looked more like demons than men as we stood in the fierce glow of the engine's fire. Once more we were in the light of day and running at a fine rate; but this did not last, as we were nearing our destination, where we soon pulled up, and descended, wishing our 'coachmen' good-day.

Between the railway and the sea we observed a great quantity of chalky rubble, various machinery, and a hut or two. This was evidently an external view of the Channel Tunnel. As we walked towards what seemed to be the headquarters, a man came forward, to whom we gave our other order. This he evidently had heard about beforehand, for, after hastily looking at our letter, he said: 'You ain't a-goin' down like that, are you?'—'Why not?' we replied.—'We had our usual tweed suits on, and did not imagine what we were in for.—'Well, if you do, you'll never be able to wear them clothes again,' said our new friend.—'What can we do, then?' we asked.—'Follow me,' was all the answer we got; so we obeyed,

and went into one of the huts, where our guide who was to be, opened a large box, from which he took some miners' clothes, some broad-brimmed hats, and some very big india-rubber jack-boots.

In these formidable but useful garments we arrayed ourselves; and when our toilet was complete, I do not think even our parents would have known us. Having fixed a candle into each of our hats, we began our exploration by entering a comparatively insignificant-looking hole, which sloped gently downwards for a little way, when we, by turning a bend, lost sight of daylight and began to look around us. We found that we were tramping in Indian file along an exceedingly dirty sort of passage, upon the bottom of which was laid a rough railway, on which the little trucks ran which brought the excavated chalk from the head of the boring. Presently, we stopped for a moment, and our guide told us we were coming to a wet spot; and sure enough we were. It was one of those fissures in the chalk which act as a sort of underground watercourse, and through this the water was streaming; not the sea-water, but the natural water which is always held by the chalk as a sort of natural reservoir and which forms the sources of our south-country water-supply. This water mixing with the finely ground chalk from the boring-machine, formed an oozy mud, through which we waded till we came to the end of our journey, where the drill stood against the heading, although, unfortunately, it was not then at work. As we stood there, neither of us uttered a word, and the intense stillness was only broken by the dripping of the water from the roof of the tunnel. Our tallow-candles shed a dim light around us, and we began to realise that we were at the end of a narrow passage deep down in the solid, or, to be correct, rather soft, lower chalk, but not quite beneath the sea. Having picked up a piece of chalk from the face of the heading and a nodule of iron pyrites, which glistened like gold in the rays of our 'dips,' we retraced our sloppy steps, and once more emerged into the light of day, after half an hour's walk in the heart of the chalk.

We then appreciated the value of the miners' costumes, for we were wet through with icy-cold water, and our boots were filled with chalky mud; so we had a swim in the now tepid sea, and once more resumed our normal clothing. A delightful though terribly hot walk along that wild and land-slipped coast soon brought us to Folkestone, whence we returned to Dover by train, having enjoyed the privilege of a walk to the bottom of the Channel Tunnel.

A CHANCE CHECKMATE.

THREE years ago I was a girl of sixteen, unemancipated from the schoolroom. My father was—and is—banker at Siston. The town lies in a valley, and by a great many people is thought unhealthy. Having a kinsman whom he can thoroughly trust as acting manager, papa these many years since has abandoned the Red House in Siston Broadway, and resided at the Manor, Walsley. This is, however, twelve miles from his place of business—eight by rail added to four by road. The Manor has one other drawback—it stands in a very isolated situation. Our nearest neighbours are our namesakes, the Escotts of

Walsley Cross; and Valentia Lodge, the country-seat of Captain Milne Escott, lies westward across the wilderness we call the Heath a good three miles.

The month when my story opens was that of February Fill-dike, and it was justifying its name. Of storms we seemed to have a ceaseless succession. Heavy rains and high winds had been for several weeks the prevailing meteorological conditions. Alice—my younger sister—and I were prisoners within doors; and we should have found time drag more heavily than it did but for the presence of Val. An only brother is always a girl's hero, and Val was ours. In age he came between us, and his proper place at this period of the year was Rugby. But he had met with an accident at Christmas, and was only just convalescent. Hence, his holidays had already lasted in excess a full fortnight of the working term. As perhaps Val may read this, I will be candid, and add that there were seasons when, owing to his teasing, we heartily wished him back in the Midlands. The Tuesday on which papa announced his urgent summons to Ferris Court was, however, not one of those occasions. Boreas was doing his best to bring the house about our ears. We could not possibly go out in the tempest. We were not ultra-enthusiastic readers; and fancy-work was ever Alice's *bête noire*; therefore, we must have settled into tame subjection to *ennui* but for Val. It was his business, as he put it, to make things lively; and he did.

I had ventured to demur to papa's going. Surely it was my place to care for him as mamma would have done had she lived, and his health had troubled me of late, thoughtless as I too frequently was.

'It is a dreadfully rough day, papa,' I said. 'Cannot Sir Hugo Ferris wait? It is such a distance, too, to Ferris Court; and all across country. You can't reach the place readily by rail.'

'No; I wish that I could,' papa answered. 'But the journey is quite imperative. Sir Hugo is one of our best patrons. He telegraphs that his departure for Algiers is fixed definitely for Thursday—an alteration of a week in his arrangements; and I have urgent matters to discuss with him. He insists—foolishly, but I cannot help it—on negotiating with the principal; he will have none of Mr Bellets.' I suppose my face was visibly lengthening, for before I could reply, papa added:—'Don't look so glum about it, Maggie. You'll be quite safe here in charge of Mrs Climber, our new housekeeper. I am convinced that, after many changes and mishaps, we have secured a treasure. I say this because it is uncertain if I shall return to-night.'

'Not return to-night!' I echoed helplessly.

'No,' he said. 'I have decided to take the horses the whole way; and as the roads are in a bad state, Spence will put the cattle up in the village and then drive me back the next morning. I shall be sure of comfortable quarters at Ferris Court.'

'Is it quite—safe?' I asked.

'For me, do you mean?'

'No-o; for us. This house is so lonely, and it is known that there are mamma's jewels—and the pictures—and the plate.'

Papa scoffed at my fears. 'We are too far from the track of the light-fingered prowler to receive his attentions,' he answered.

But it was an error.

Ever since that day, I have had a lurking belief in presentiments. I know very well that the confession will cause some superior persons, fortified in the lines of a sane common-sense, to smile with pity at my girlish weakness. I am somewhat disposed to smile with them; and yet it is not more certain that a plot existed to rifle the Manor, than that hour by hour after papa had gone I grew more and more vaguely but genuinely uneasy. I said nothing to either Val or Alice. What was there to say? Nor to Mrs Climber. Somehow, I had not taken to the fresh arrival so warmly as the others. I did not dispute that her recommendations were first-class; that her demeanour to each of us was precisely what it should be—neither over-deferential nor too familiar; that she was a skilled house-mistress and a paragon of order. Nevertheless, I had consciously frowned when papa praised her; and I was in no hurry to take her into confidence when a nameless oppression weighed upon my spirits. Alice had discovered my lack of enthusiasm long ago, and insisted that I was prejudiced because Mrs Climber was foreign-looking, and had an affected way of putting up an eyeglass, which, in the opinion of Val and myself, was totally useless to her. I allowed Alice to think as she pleased; the fact remained, that hitherto I was unconquered, and that Mrs Climber knew it.

Dusk thickened at last, and we had the approval of our consciences in closing blinds and drawing curtains to, and shutting out by every recognised expedient the driving cloud-rack, the desolate landscape, and the constant drip, drip of the complaining trees. And then Val accepted a stray challenge—mine or Alice's, I cannot now be sure; the point is immaterial—and proceeded, with a flow of boyish eloquence which promised well for his intended future at the bar, to vindicate his latest hobby, the science of graphiology. He had a notable little collection of autographs and specimens of caligraphy which he rummaged out of his hoard of treasures; and upon these he descanted with all the dogmatism of the professor and all the fervour of the disciple. As he was pointing out to half-sceptical critics and listeners an alleged resemblance between traits in the historical character of the Duke of Wellington and features in the great warrior's handwriting, he was interrupted. To the surprise of each of us, we heard the rumble of approaching wheels on the soaked avenue without.

'Can papa be back, after all, and as early as this?' Alice cried.

'Not he. That isn't our carriage. It's a brougham certainly; but Spence isn't driving it—the rattle's different,' Val answered, at the end of a short pause.

'Then who can it be?' I said with wonder and a recrudescence of anxiety.

Val crossed to the window and caught question and reply of visitor and coachman.

'Is this the place?' inquired the former.

'Yes; this be Mr Escott's o' t' Manor, Wainsey,' returned the latter.

Clang went the hall bell; and in another half-minute, Josephs, our butler, looking anything but

pleased at the interference with his session of enjoyment in the kitchen, opened our door and ponderously announced: 'Mr Lidlaw.'

The name was entirely unknown to me, as also the purport and occasion of the call. I debated for a second whether I should send Alice in search of Mrs Climber—who was, I believed, writing in her own room—or whether I should myself assume the responsibility of confronting the stranger. This question was decided for me. On the heels of the domestic advanced Mr Lidlaw; he, at least, appeared to have no doubts as to the course to follow. Under-sized, middle-aged, clean-shaven, gray—this is the best and fullest description which I could have given at the moment of the easy-going intruder, and it will suffice for my narrative.

'Ah, three of you!' he said. 'My old friend's daughters and son, I presume? I wasn't aware he was so favoured.'

The human voice is a wonderful instrument. In one case, it shall of itself convey suspicion; in another, reassurance. It was the latter here. A tyrannical imagination had painted before my mental vision with swift brush the portrait of a dangerous conspirator. The living enigma spoke, and however puzzling and mysterious his presence continued to be, my courage revived. The circumstance is as I state; the explanation I leave to others.

'My name is Escott; this is my brother—and my sister,' I stammeringly answered. 'But who—to what do we owe?'—I was a pitifully poor inquisitor. Before I had framed my query, I was stopped.

'Who am I?' the cheery stranger said. 'Well, I suppose one can't claim universal fame; but it certainly strikes me as curious that you should have to ask. As to my errand, that is just pleasure and the resuscitation of old memories. Your father and I used to be staunch friends.—You're not very like him, young gentleman.' The latter sentence was, of course, addressed to my brother Valentine.

'Indeed!' the boy said laconically.

The stranger's glance had fallen upon the strange medley that decorated our centre-table. 'Some one here is a collector of autographs, I see,' he went gaily on. 'May I inspect them?—Thank you. It is a pursuit of great interest to me; I sometimes have to study—ahem!—in a professional capacity contrast and likeness in penmanship.' He bent over Val's specimens, amongst which were included examples of the hand of nearly all the boy's acquaintances; for Val played havoc very impartially with characters ancient and modern, great and small, famous or obscure. And by-and-by I noticed a queer little start, seemingly of recognition. Mr Lidlaw looked up. 'Who wrote this?' he said. It was a couple of lines—a quotation from Tennyson—and beneath, the signature of Mrs Climber.

It was Alice who replied. 'That's the writing of our housekeeper,' she said wonderingly.—'Do you know Mrs Climber? She came to us from Leeds. I like her hand—it is so neat and pretty.'

'And it bespeaks a strong will, decision, and perhaps *finesse*,' said Val sententially, quite in the style of the lecturer.

But I felt that it was time to know more of

the visitor, who seemed to be taking his footing in our midst so much for granted. I broke in with a direct demand. 'I have never heard papa speak of you, so far as I can recollect, Mr Lidlaw, and he is not at home. Did he expect you to-night?'

Mr Lidlaw awoke as from a reverie. 'Captain Escott not at home!' he repeated. 'Expect me! I am here in response to his pressing invitation.'

Val and I had the clue to the riddle simultaneously.

'You are wanting Valentia Lodge, Walsey Cross,' I said.

'It is Mr John Escott who lives here; there's been a mistake,' cried Val.

Mr Lidlaw stood as though paralysed by the revelation of his blunder; then a shadow of intense vexation passed over his features; and this in turn yielded to a smile at his own expense. 'Whew! This comes of not being sufficiently precise in investigation; a lesson I hardly ought to need to learn, after all these years,' he grimly soliloquised. Then he bowed deprecatingly to us, and proceeded: 'The storm was raging so fiercely, that I was content in the station-yard with little delay and few words. I asked the coachman who was handiest if he could drive me to Captain Escott's, Walsey, and he said "Yes." I suppose he did not catch more than the surname; and I was ignorant that Walsey and Walsey Cross are not identical places.'

'They are three miles apart,' said Val.

'I was uncertain of my train, or Captain Escott would have sent to meet me. I begged him not to do that. The question now is, how to get away, for the driver—he was none too sober—is gone, and my luggage is in your hall. It is most unfortunate and absurd, and wholly my fault, for I remember remarking that the fellow called your home "the Manor"—which was not a familiar name for it—both at Daleford Station and here on arrival. I tender a thousand apologies.'

Forthwith, our group of four resolved itself into a committee for dealing with this singular emergency. Our debate had but a lame issue. If papa had been here, and had become convinced of the *bona fides* of his uninvited guest, he would have sent Spence with Mr Lidlaw to Captain Escott's. But both papa and the man were absent. Josephs was old, and often ailing; I hesitated to suggest any scheme that should involve his going out into the tempest. And certainly Val must not venture any such exposure.

Mr Lidlaw carefully inquired his way, and announced that he should walk. He asked too—very oddly, as I thought, with a new twinge of doubt—the nearest route back to Daleford village. Val's directions were clear and full; and if the stranger obeyed them, he could not possibly go astray in either direction. It seemed inhospitable to permit him to turn out unattended into the night; but I could perceive no alternative; and I have reason to think that he would have overruled any and every objection.

Mrs Climber had not appeared. This struck us afterwards as strange. However busy she might be with her correspondence, it was curious that she should have heard nothing of the arrival, or that, hearing, she should have kept away. Some twenty minutes after Mr Lidlaw had left,

she entered the drawing-room and listened to our joint narrative of what had happened. I fancied that she was preoccupied, until Alice casually referred to the visitor's inspection of her handwriting, and that then her manner changed, and she listened with more interest—even anxiety—than she cared for us to observe. From this fact—if such it were—I was, however, at a loss to draw any particular deduction.

I pass over the hours that elapsed between this episode and midnight. We had retired early, and the house ought to have been as dark and still as if uninhabited. Older friends tell me that it is the privilege of healthy girlhood to sleep soundly and with ease. I do not doubt that they are right. But on this occasion I continued obstinately awake. The day had not wanted in agitations and surprises, and they had affected my spirit with unusual restlessness. Perhaps I am nervous by temperament, and it was this quality which filled the darkness with shapes of terror, and my brain with inchoate fears of some stealthily on-creeping evil. It is likely enough to be the true and ample explanation of my mental condition. Certainly, I could not rest. How vainly I wished that I had proposed to Alice that we should occupy to-night the same room. She would have consented instantly, although I had no reason to suppose that Alice shared my tremors. But it would be a confession of cowardice of which I should not soon hear the last to go to her now, even if the situation of her room, at the end of a long, silent corridor and across a mid-landing, was an insufficient deterrent. No; I must toss and turn and wait for the tardy morning.

Suddenly, a chill shot through my veins; I sat up amongst the pillows, rigid, and, I doubt not, blanched almost to their own whiteness. I listened in a very agony of attention. From the depths below there had echoed distinctly upwards—or my faculties were playing me false—the sound of the sullen yielding of a bolt. My apartment was immediately over the plate-closet, and adjacent to the partition which closed in the second flight of stairs. This accounted for the transmission of the noise. But the noise was an ominous disclosure. In the dead of night, it was surely illegitimate, and spoke of crime.

The veriest craven will sometimes obtain an access of courage as mysterious in its source as, generally, transient in its sway. I am not calling myself hard names. Indeed, I should be sorry to believe that I absolutely belong to the class whose badge is a white feather. But I have owned to trepidation; and now I mastered for at least a few minutes the first paralysis of fright. I pressed my throbbing temples hard against the wainscot, and found that the wood was a faithful conductor of sound. A rumbling and grating that could have no honest and satisfactory cause, jarred upon my highly strung nerves. I was not the victim of delusion. Assured of this, I began to dress, with quaking, fumbling fingers and in the dark. Plan I had none as yet, and my actuating purpose was merely to reach and alarm the rest of the household. It was just blind instinct, for I did not pause to ask what effectual resistance to a gang of robbers could be offered by a pack of scared women, an invalid boy, and one tottering old man.

I thought first of Miss Turpin, our governess, and Mrs Climber, and in this order. They both occupied rooms on the same floor as myself, but far in the rear of the building. It was an ugly venture to get to them. As I was debating, I remembered my mother's jewels. These were deposited in a dressing-case locked into a wardrobe strong-box in papa's room. Had they escaped the thieves? Would they escape? By almost a mechanical impulse, I unfastened and opened my door, and stepped lightly the five or six paces to that of the vast cavern-like chamber in which, the fable goes, a queen once slept. There was a light within other than that of the wan young moon, which glimmered feebly through lozenge-shaped panes in a window high over my head. I sucked in my breath with a well-nigh audible gasp, and shivered; but it was as though a subtle fascination drew me nearer in spite of the peril. I crept to the tell-tale crack through which the pencilled line of light fell. A single peep, and I knew the worst: we were betrayed. Kneeling before the receptacle of my mother's family heirlooms was a woman, holding a lamp for the guidance of a male confederate, who busied himself with a file at the wardrobe lock. They seemed equally absorbed in their nefarious task. The man I had never before seen; the woman was Mrs Climber. I believe I was nigher to swooning than on any previous or subsequent occasion. Luckily, with a supreme effort I was able to recover the self-possession wrested from me by the double shock. I dare not think what might have been the denouement, in the contrary event.

How papa had been deceived! and all of us, for, though I had vaguely disliked the newcomer, no suspicion of her fidelity had entered my mind; yet my eyes had testified that she was an accomplice in a sinister plot. Very possibly she was its originator.

It gave me intense anxiety to decide upon my next step. A daring suggestion flew to my brain; but I dismissed it, not so much as impracticable as useless. It was to lock the two thieves in. This was possible if managed with adroitness, for the key cast a shadow on the polished floor. Mrs Climber had locked the door of papa's room with hypocritical care, as we retired that night, saying that housemaids were curious, and had been known to walk in their sleep, and that it was not well to trust them to excess. And now the adventuress had left the key on the outside. But what would the countermove avail? There were villains below making away with the plate; I had heard them: they would come to the rescue, and I had no means of successfully following up the temporary advantage. Yet my fingers itched to drag to that door and imprison my foes.

Clang! clatter! all our bells seemed to be ringing at once, and Mrs Climber's precious confederates would not have given the alarm; it must mean for them interruption and discomfort. And in a trice I had acted on my wild idea. The great oak door was fast—fast! I had the key, and with it I fled to my own room. There I cowered as children do under the bed-clothes, and suffered paroxysm after paroxysm of helpless abject terror. Every

vestige of bravery, deliberate or fortuitous, had forsaken me. But I was not molested.

What happened on the other side of my fortress can be simply and succinctly related in the words with which on the morrow, our friend and benefactor, Mr Lidlaw, enlightened papa. It will be needful to resume from the point of his recognition of Mrs Climber's handwriting when chatting in our drawing-room.

'You see, I am an expert in these matters,' he said. 'Probably you may have seen my name in the newspapers in connection with some trial, civil or criminal, in which the identification of handwriting has formed a leading feature in the proceedings?'

'I have,' papa answered.

'Exactly. And two months ago I had to make a professional study of various documents and signatures in a north-country case of systematic and long-continued fraud. I am prepared to swear that the specimen of Mrs Climber's, alias Mrs Clegg's hand shown me by your son is the fac-simile of a large number of those forged papers. The writer is the same. And now that I have seen her—she had a most valid reason for keeping in the background yesterday evening—I recognise the woman too. She only escaped a long term of penal servitude through the plea that she was her husband's tool. And another thing made me startled and suspicious. It was this: at Daleford, a man left the same train, whom I identified, in spite of his wrappings, as the brother of the condemned Long Firm swindler who stood in the dock with Mrs Clegg. He'll soon follow him into a convict cell. He was involved in the Manchester case, though there was a flaw in the evidence, and he eluded the grasp of justice.'

'But Mrs Climber's testimonials—they were most excellent,' murmured papa.

'Forged, my dear sir; I entertain no doubt of it,' replied Mr Lidlaw. 'These people saw your advertisement, and application and references were all parts of rather a clever "plant." But the female trickster carried her daring a step too far, and will pay the penalty. When I was confronted with that couplet, in the hand I had so much reason to know, I got an inkling of the game that was afoot. And instead of going on to Walsley Cross, I returned to Daleford and interviewed a sergeant of police. It seemed that he was in possession of an official warning that tended in the like direction of watchfulness. We both had a suspicion that you might have been lured out of the way by a bogus message.'

'No; there was no stratagem there,' put in my father.

'Then events conspired so far with the gang of rogues. Well, we came up to the Manor to make sure that all was right, and we found an open window and moving lights. We were five in number and armed. The sergeant and two of his men entered by the same road as the burglars, and at a signal from the officer I aroused the household. One thief was taken in the act of selecting the choicest specimens of your old-fashioned silver; and, to our infinite bewilderment, we discovered later that your clever house-keeper and a second confederate were caught like rats in a trap. That was the work of Miss Maggie here. As soon as we learned this, we

applied to the young lady, got the key, and entered. We were only just in time to thwart an attempt to escape by the window. But for the height and the awkwardness of the descent, the man at least would have escaped. But the three are in Siston jail.'

'And I have to thank you,' said papa, 'for the protection of my property, Mr Lidlaw; I am sincerely grateful.'

'And I am glad to have been of service,' answered our friend.

My story is almost at its close. One point which was cleared up at the trial at Siston assizes was that of the choice of the occasion for the attempt. It came out that a fictitious letter had been compiled which would equally have taken papa from home that stormy February night; but this part of the scheme was rendered superfluous by the genial message of Sir Hugo Ferris, and the resolve to which papa subsequently came.

Mrs Climber—boasting many other names equally convenient for a month or a year—was this time punished by a heavy sentence, her two associates being treated with the like severity.

Val believes more than ever in graphiology.

We lost a housekeeper, but gained a permanent friend. Mr Lidlaw comes now as frequently to Walmsey as to Walmsey Cross. And may I not confess that there is more behind? I have special reason to remember with thankfulness the deliverance from that dark peril. To these events I owe an introduction to Harry Lidlaw, Mr Lidlaw's nephew. He, too, is our friend; and I have promised that one day I will let him assume a still dearer title. It is unnecessary to be more explicit; any loving girl's heart will read the meaning into the riddle.

A NEW DEPARTURE IN BRAZING AND WELDING.

Mr Thomas Fletcher, Warrington, writes to us as follows: The cheapening of oxygen by Brin's process of manufacture has put into the hands of metal-workers a new power. I have recently made a few experiments with the compressed oxygen and coal-gas, and found that with a half-inch gas supply, a joint could be brazed in a two-inch wrought-iron pipe in about one minute, the heat being very short, the redness not extending over one inch on each side of the joint. The appearance of the surface after brazing led me to experiment further with welding, a process which is not possible with ordinary coal-gas and air, owing to the formation of magnetic oxide on the surfaces. Contrary to my expectation, a good weld was obtained on an iron wire one-eighth inch in diameter, with a very small blowpipe, having an air-jet about one-thirty-second of an inch in diameter. This matter requires to be taken up and tried on a large scale for such work as welding boiler-plates, which, it appears to me, can be done perfectly with far less trouble than would be required to braze an ordinary joint. The great advantage of this would be that the boilers would require no handling, but could be welded with an ordinary large blowpipe in position, and with about one-tenth the labour at present necessary.

The cost of the oxygen is trifling, and it is evident, from the results obtained in brazing, that

the consumption of gas would be considerably less than one-fourth that necessary with an air-blast, irrespective of the fact that welding is possible with an oxygen blast, whereas it is not possible if air is used. The surface of iron heated to welding-heat by this means comes out singularly clean and free from scale; and a small bottle of compressed oxygen with a blowpipe and a moderate gas supply would make the repairs of machinery, boilers, brewing-coppers, and other unwieldy apparatus a very simple matter. The trouble and difficulty of making good boiler-crowns, which so frequently 'come down,' would be very small indeed, when the workman has an unlimited source of heat at command under perfect and instant control.

AT LAST.

Warte nur—bald
Ruhest du auch!—GOETHE.

Long and weary is the road;
Falls no sunlight through the day;
One by one, beneath his load
Has each loved one sunk away.
Friends are fled—their wearied eyes
Closed in sleep, and stilled each breast.
Here and there, a shadow lies
Where they sank to rest.
Faint not, O pilgrim!
Life's noon is past;
But to each traveller
Home comes at last!

Winds are wailing round thy way;
Heavy is thy load to bear;
With the waning of the day,
Fades each joyous thing and fair.
Where is now thy dauntless force?
Where thy ardour full and free?
All thy strength has run its course—
Nought is left to thee!
Hope on, hope aye;
Heed not the blast,
For to each day
Night comes at last!

Faint not yet, but struggle on
Till the weary way is o'er;
Soon thy long day's work is done;
Soon thine eyes shall weep no more.
Bright the rising day may be;
Glorious was thy morning-star;
But the dawn that waits for thee
Fairer is by far!
See! the red sun
Sinks in the sea;
Labour is done,
Pain o'er for thee.
Fled is the day;
Sunset is past.
Pause on thy way,
And rest thee—at last!

SOCIETY.

ADDISON tells us that 'there is a sort of economy in providence that one shall excel where another is defective, in order to make men more useful to each other and mix them in Society.' That Society in these days is a mixture, and a most extraordinary one, is an undoubted fact; but the mixture is hardly in the sense Addison meant when he wrote of the utility of cleverness and mediocrity being blended, so that the one might counteract the other. Now, the word Society does not mean a number of more or less clever people meeting together, being of mutual advantage to each other, and constituting a tolerably unanimous whole; but merely signifies a certain 'clique' or 'set' to which we belong, possibly just a trifle above what would by right be considered our own proper sphere. Mutual advantage is lost sight of in personal advancement—not advancement for any really good end, but simply 'to be in Society.' To be asked here, to be asked there, to meet Lady B, or to have the honour of treading on Lady C's train. To have the last fashionable and run-after actress to assist at our 'At Homes,' or to sell things, cigars with the ends bitten off, white kittens, or button-holes, at our charitable bazaars. To stand in a crowd on the staircase of a well-visited house at one of the best parties of the season, miserably packed in amidst a cross multitude of other victims, without even seeing your hostess, with your temper ruffled and your dress torn, but your name proudly figuring in the *Court Journal* the next morning. To lounge away your mornings in the Row, your afternoons at garden-parties or five-o'clock teas, and your evenings in a scramble from dinner-parties to possibly two or three balls in succession. To talk Art and the ruling topics of the season, whatever these may be: the weather, the last new story about the favourite actress, the cookery schools, lawn-tennis, and *the Beauty* of the season. Society of this order may be regarded as frivolous; that of a loftier kind would probably be heavy; we say probably, because just at this

stage such Society—that is, with a certain and definite aim—does not exist; and people with objects and decided aims in life are looked on in the light of general nuisances, to be snubbed and avoided.

Real workers often look on 'going into Society' as a recreation, a relief from the dull routine of workaday toil; an hour or two of butterfly-life to be indulged in now and then, but sparingly, and made up for by harder work in Grub Street afterwards. The real steady worker holds Society but lightly, because he or she has a definite end in view, of which the mere ephemeral insect scarcely dreams. Such can hardly be deemed denizens of the world of fashion; they are only flutterers outside of it, not attracted even by its false glare, but esteeming it as merely 'a means to an end'—the end to them being the return to labour refreshed by the passing glance, and participation in a totally different society from that with which their work brings them in contact.

To the butterflies, however, Society-life wears an entirely different aspect; they live the whole year through in one incessant round of endless gaiety, which after a time becomes as tedious as the daily round of work—more so, for no ultimate object, no desired goal lies before them. Winters in country-houses filled with the same set; seasons in town, with the fashionable seaside places, Brighton or Scarborough, as a 'pick-me-up' during the period over which they extend; and a fitting to some German waters when they are finally at an end, again to drink in the health on which heated rooms, late hours, and the ceaseless round of dissipation have done their work.

In our day, manner and style—slangily termed 'form'—rank before mind. If a person in Society is well read and well informed, his or her object is more to hide such knowledge, for fear of being looked on in the light of a 'bore' or a nuisance, than to impart it by agreeable conversation to others. Many people who are really clever, and from whom much useful information might be obtained, conceal it, from a feeling that those around them will say: 'O yes; So-

and-so is clever undoubtedly; but I can't stand people talking "shop." And so, really sensible conversation is pooh-poohed, that place may be given to the inane, frothy babble which does duty too frequently as conversation in Society. The freshest news of the latest scandal, the last *on dit* of the clubs, a new piece of gossip—such are the most acceptable topics in general Society talk. We have no wish to be severe by writing in this strain, and we can do little more than draw attention to it, for, unfortunately, we see no remedy which can be generally applied to stop the evil, which the popular 'Society' journals of the day do all they can to foster.

Madame de Staël writes of the delicate distinction between 'Society' and 'the world.' This distinction would now seem to be lost, for to be in the one constitutes our greatest claim—socially speaking—on the other. Perhaps a line is drawn by some; but so fine is it, that it is next to invisible—merely a cordon stretched only in the depths of our 'inner consciousness,' of no good, not even apparent to the outside world, and but faintly recognised by ourselves, too often coming under the head of a 'make-believe,' a sort of salve to our own consciences only, and of no possible use in stemming the current of worldliness raging around us, because it is not a real heartfelt feeling, and therefore powerless.

After a time, Society such as we have described, the eternal round of endless visiting and gaiety, palls; but yet it is continued, though ennui has entered and spoilt the zest with which we pursued it. Horace Walpole translates the word ennui to mean literally, 'what is called "entertaining people" and "doing the honours;" that is, you sit an hour with somebody you don't know and don't care for, talk about the wind and the weather, and ask a thousand foolish questions, which all begin with, "I think you live a good deal in the country;" or, "I think you don't love this thing or that." Oh, 'tis dreadful!'

Such conversation, though inexpressibly tedious, would be harmless. We do not now confine ourselves to wind and weather, town and country, likes and dislikes, but drag in our neighbours and their affairs, let the ball of scandal gather as it rolls past us, until a mountain is made out of a molehill. We still suffer from ennui, the same as Walpole did; the calling, the receiving of visits, the afternoon teas, the long dreary dinners, the crushing 'At Homes,' are all so many daily troubles, daily trials to be gone through with as duties—save the mark!—with nothing to show for them beyond impaired bloom and beauty—too often artificially renewed—injured health, and a large circle of acquaintances not to be dignified by the name of friends.

There are many central figures in Society. The cynosure in particular of this nineteenth century appears to be 'the Beauty'—the lady, usually a married one, whose name is on every one's lips; all whose doings are chronicled in the 'Society papers'—how she looked; what she wore; whom she danced with; what bazaar she attended, what she sold, and whom she sold it to; what she bought; where she is going for the summer; where she came from; who has taken her best photograph—and so on. The interest taken in

her movements is truly wonderful; she is mobbed, rudely stared at wherever she goes, and, until a fresh beauty appears, reigns supreme. There are other special attractions—but 'Beauty' ranks first. The pet actress, the most fashionable artist, the most run-after literary lion, the most sensational female novelist—these all have their own special circle of admirers, who retail their latest sayings and doings, and are asked about everywhere with the object of their worship.

All the several cliques go to make up one imposing whole, termed collectively Society; with the addition of the numerous unattached butterflies of both sexes, idlers about town, young and old, well born and *nouveaux riches*, hangers-on to Society, clinging as it were to her fringes—all pushing and striving more or less. And so the crowd whirls on, those outside the magic circle moving heaven and earth to get within the pale; those within it dragging on the same millwheel round, trying to believe they are enjoying it, and deadening the higher, better feelings, which many of them must possess, in one incessant bustle; longing, perhaps, inwardly for something else, some real aim for their lives to live up to, but yet bound down to the treadmill of fashionable life. *Cui bono?* Ay, here's the question; but who feels equal to answering it? Do those who are in the world and move in the highest rank of Society really gain anything by it? They have reached, as it were, the acme of their ambition, and have it in their power to hold out finger-tips to the jostling outer crowd still striving to be considered as members of the mystic circle. Do they still care for the sweets—if there are any—in their self-chosen path? or have these all turned into wormwood and gall, and something else has yet to be striven and fought for? The outsiders, the mixed multitude who are striving for they know not what, consider that when once they have firmly established themselves, got 'all the best people' to attend their entertainments, and are asked in return to their houses, that then, blissful thought! they will be really in Society, and no more will be required of them. But when they get so far, they are insensibly pushed farther, until they find they cannot stop, and their whole lives are given up to the game of follow-my-leader.

The false aims and false desires of Society are too frequently followed to the total extinction of all the best feelings and hopes of the soul. They lead to a thoroughly selfish existence. Self alone is the motto of too many. Higher, nobler feelings are cast on one side, as not worth a thought. The brightness of the hour, the social triumph, 'the mark made in Society,' the flattery of the million, are the only things worth living for. Self-indulgence is more alluring than self-sacrifice. Personal ease and personal gratification come before thought for others or desire to help them. Really honest, true, and maybe noble natures quickly become perverted and spoilt in the fashionable race. 'Self' is Society's watchword. But if once the eyes are really opened to the folly of those things, till now held dear, then the cure soon follows. Many will be found to help us along; those once perhaps despised by us as 'not being in our set,' as mere 'goody, preaching people, who mean very well, no doubt, but'—will

now be found real helpers to us in our new and, at first, uphill road. When thoroughly out of heart, and sick with the frivolities, the shams, the 'make-believes' of the world's true followers—when our eyes are really opened to the vanity, the heartlessness, the downright folly of a life so lived—then we shall not be long before we find a fresh path, a better one, open up for us. Then we shall see the untruths, so little thought of before, in their right light; we shall break through the web of selfishness in which we have woven ourselves; learning to judge our actions by a higher standard, and forbearing to judge those of others.

THIS MORTAL COIL

CHAPTER XII.—THE PLAN IN EXECUTION.

HUGH hurried along the dike that bounded the salt-marsh meadows seaward, till he reached the point in his march up where the river narrowed abruptly into a mere third-class upland stream. There he jumped in, and swam across, as well as he was able in the cold dark water, to the opposite bank. Once over, he had still to straggle as best he might through two or three swampy fields, and to climb a thickset hedge or so—regular bullfinches—before he fairly gained the belated little high-road. His head swam. Wet and cold and miserable without, he was torn within by conflicting passions; but he walked firm and erect now along the winding road in the deep gloom, fortunately never meeting a soul in the half-mile or so of lonely way that lay between the point where he had crossed the stream and the *Fisherman's Rest* by the bank at Whitestrand. He was glad of that, for it was his cue now to escape observation. In his own mind, he felt himself a murderer; and every flicker of the wind among the honeysuckle in the hedge, every rustle of the leaves on the trees overhead, every splash of the waves upon the distant shore, made his heart flutter, and his breath stop short in response, though he gave no outer sign of fear or compunction in his even tread and erect bearing—the even tread and erect bearing of a proud, self-confident, English gentleman.

How lucky that his rooms at the inn happened to be placed on the ground-floor, and that they opened by French windows down to the ground on to the little garden! How lucky, too, that they lay on the hither side of the door and the taproom, where men were sitting late over their mug of beer, singing and rollicking in vulgar mirth with their loud half-Danish, East-Anglian merriment! He stole through the garden on tiptoe, unperceived, and glided like a ghost into the tiny sitting-room. The lamp burned brightly on the parlour table, as it had burnt all evening, in readiness for his arrival. He slipped quietly, on tiptoe still, into the bedroom behind, tossed off a stiff glassful of brandy-and-water cold, and changed his clothes from head to foot with as

much speed and noiselessness as circumstances permitted. Then, treading more easily, he went out once more with a bold front into the other room, flung himself down at his ease in the big armchair, took up a book, pretending to read, and rang the bell with ostentatious clamour for the good landlady. His Plan was mature; he would proceed to put it into execution.

The landlady, a plentiful body of about fifty, came in with evident surprise and hesitation. 'Lord, sir,' she cried aloud in a slight flurry, 'to think of that now! I took it you was out; an' them men a-singing an' ballyin' like that over there in the bar-room! Stannaway he'll be downright angry when he finds you've come in an' all that noise goin' on in the 'ouse, as is 'ardly respectable. We never heerd you, nor knowed you was in. I 'ope you'll excuse them, sir, bein' the fishermen from Snade, enjoyin' theirselves their own way in the cool o' the evenin'.'

Hugh made a manful effort to appear unconcerned. 'I came in an hour ago or more,' he replied, smiling—a sugar-of-lead smile.—'But pray, don't interfere with these good people's merriment for worlds, I beg of you. I should be sorry, indeed, if I thought I put a stopper upon anybody's innocent amusement anywhere. I don't want to be considered a regular kill-joy.—I rang the bell, Mrs Stannaway, for a bottle of seltzer.'

It was a simple way of letting them know he was really there; and though the lie about the length of time he had been home was a fairly audacious one—for somebody might have come in meanwhile to trim the lamp, or look if he was about, and so detect the falsehood—he saw at once, by Mrs Stannaway's face, that it passed muster without rousing the slightest suspicion.

'Why, William,' he heard her say when she went out, in a hushed voice to her husband in the taproom, 'Mr Massinger, he's bin in his own room all this time, an' them men a-shoutin' an' swearin' out 'ere like a pack of savages.'

Then, they hadn't noticed his absence, at any-rate! That was well. He was so far safe. If the rest of his plan held water equally, all might yet come right—and he might yet succeed in marrying Winifred.

To save appearances—and marry Winifred! With Elsie still tossing on the breakers of the bar, he had it in his mind to marry Winifred!

When Mrs Stannaway brought in the seltzer, Hugh Massinger merely looked up from the book he was reading with a pleasant nod and a murmured 'Thank you.' 'Twas the most he dared. His teeth chattered so he could hardly trust himself to speak any further; but he tried with an agonised effort within to look as comfortable under the circumstances as possible. As soon as she was gone, however, he opened the seltzer, and pouring himself out a second strong dose of brandy, tossed it off at a gulp, almost neat, to steady his nerves for serious business. Then he opened his blotting-book, with a furtive glance to right and left, and took out a few stray sheets of paper—to write a letter. The first sheet had some stanzas of verse scribbled loosely upon it, with many corrections. Hugh's eyes uncon-

sciously fell upon one of them. It read to him just then like an act of accusation. They were some simple lines describing some ideal utopian world—a dream of the future—and the stanza on which his glance had lighted so carelessly ran thus :

But, fairer and purer still,
True love is there to behold ;
And none may fetter his will
With law or with gold :
And none may sully his wings
With the deadly taint of lust ;
But freest of all free things
He soars from the dust.

'With law or with gold,' indeed ! Fool ! Idiot ! Jackanapes ! He crumpled the verses angrily in his hand as he looked, and flung them with clenched teeth into the empty fireplace. His own words rose up in solemn judgment against him, and condemned him remorselessly by anticipation. He had sold Elsie for Winifred's gold, and the Nemesis of his crime was already pursuing him like a deadly phantom through all his waking moments.

With a set cold look on his handsome dark face, he selected another sheet of clean white notepaper from the morocco-covered blotting-book, and then pulled a bundle of old, worn-edged letters from his breast-pocket—a bundle of letters in a girl's handwriting, secured by an elastic india-rubber band, and carefully numbered with red ink from one to seventy, in the order they were received in. Hugh was nothing, indeed, if not methodical. In his own way, he had loved Elsie, as well as he was capable of loving anybody : he had kept every word she ever wrote to him ; and now that she was gone—dead and gone for ever—her letters were all he had left that belonged to her. He laid one down on the table before him, and yielding to a momentary impulse of ecstasy, he kissed it first with reverent tenderness. It was Elsie's letter—poor dead Elsie's.—Elsie dead ! He could hardly realise it.—His brain whirled and swam with the manifold emotions of that eventful evening. But he must brace himself up for his part like a man. He *must* not be weak. There was work to do ; he must make haste to do it.

He took a broad-nibbed pen carefully from his desk—the broadest he could find—and fitted it with pains to his ivory holder. Elsie always used a broad nib—poor drowned Elsie—dear, martyred Elsie ! Then, glancing sideways at her last letter, he wrote on the sheet, in a large flowing angular hand, deep and black, most unlike his own, which was neat and small and cramped and rounded, the two solitary words, 'My darling.' He gazed at them when done with evident complacency. They would do very well : an excellent imitation !

Was he going, then, to copy Elsie's letter ? No ; for its first words read plainly, 'My own darling Hugh.' He had allowed her to address him in such terms as that ; but still, he muttered to himself even now, he was never engaged to her—never engaged to her. In copying, he omitted the word 'own.' That, he thought, would probably be considered quite too affectionate for any reasonable probability. Even in emergencies he was cool and collected. But 'My darling' was just about the proper mean. Girls are always

stupidly gushing in their expression of feeling to one another. No doubt Elsie herself would have begun, 'My darling.'

After that, he turned over the letters with careful scrutiny, as if looking down the pages one by one for some particular phrase or word he wanted. At last he came upon the exact thing : 'Mrs Meysey and Winifred are going out to-morrow.'—'That'll do,' he said in his soul to himself : 'a curl to the *v*'—and laying the blank sheet once more before him, he wrote down boldly, in the same free hand, with thick black down-strokes, 'My darling Winifred.'

The Plan was shaping itself clearly in his mind now. Word by word he fitted in so, copying each direct from Elsie's letters, and dovetailing the whole with skilled literary craftsmanship into a curious cento of her pet phrases, till at last, after an hour's hard and anxious work, round drops of sweat standing meanwhile cold and clammy upon his hot forehead, he read it over with unmixed approbation to himself—an excellent letter both in design and execution.

WHITESTRAND HALL, September 17.

MY DARLING WINIFRED—I can hardly make up my mind to write you this letter ; and yet I must : I can no longer avoid it. I know you will think me so wicked, so ungrateful : I know Mrs Meysey will never forgive me ; but I can't help it. Circumstances are too strong for me. By the time this reaches you, I shall have left Whitestrand, I fear for ever. Why I am leaving, I can never, never, never tell you. If you try to find out, you won't succeed in discovering it. I know what you'll think ; but you're quite mistaken. It's something about which you have never heard ; something that I've told to nobody anywhere ; something I can never, never tell, even to you, darling. I've written a line to explain to Hugh ; but it's no use either of you trying to trace me. I shall write to you some day again to let you know how I'm getting on—but never my whereabouts.—Darling, for Heaven's sake, do try to hush this up as much as you can. To have myself discussed by half the county would drive me mad with despair and shame. Get Mrs Meysey to say I've been called away suddenly by private business, and will not return. If only you knew all, you would forgive me everything.—Good-bye, darling. Don't think too harshly of me.—Ever your affectionate, but heart-broken
ELSIE.

His soul approved the style and the matter. Would it answer his purpose ? he wondered, half tremulously. Would they really believe Elsie had written it, and Elsie was gone ? How account for her never having been seen to quit the grounds of the Hall ? For her not having been observed at Almundham Station ? For no trace being left of her by rail or road, by sea or river ? It was a desperate card to play, he knew, but he held no other ; and fortune often favours the brave. How often at loo had he stood against all precedent upon a hopeless hand, and swept the board in the end by some audacious stroke of inspired good play, or some strange turn of the favouring chances ! He would stand to win now in the same spirit on the forged letter. It was his one good card. Nobody could ever prove

he wrote it. And perhaps, with the unthinking readiness of the world at large, they would all accept it without further question.

If ever Elsie's body were recovered! Ah, yes: true: that would indeed be fatal. But then, the chances were enormously against it. The deep sea holds its own: it yields up its dead only to patient and careful search; and who would ever dream of searching for Elsie? Except himself, she had no one to search for her. The letter was vague and uncertain, to be sure; but its very vagueness was infinitely better than the most definite lie: it left open the door to so much width of conjecture. Every man could invent his own solution. If he had tried to tell a plausible story, it might have broken down when confronted with the inconvenient detail of stern reality: but he had trusted everything to imagination. And imagination is such a charmingly elastic faculty! The Meyseys might put their own construction upon it. Each, no doubt, would put a different one; and each would be convinced that his own was the truest.

He folded it up and thrust it into an envelope. Then he addressed the face boldly, in the same free black hand as the letter itself, to 'Miss Meysey, The Hall, Whitestrand.' In the corner he stuck the identical little monogram, E. C., written with the strokes crossing each other, that Elsie put on all her letters. His power of imitating the minutest details of any autograph stood him here in good stead. It was a perfect fac-simile, letter and address: and tortured as he was in his own mind by remorse and fear, he smiled to himself an approving smile as he gazed at the absolutely undetectable forgery. No expert on earth could ever detect it. 'That'll clinch all,' he thought serenely. 'They'll never for a moment doubt that it comes from Elsie.'

He knew the Meyseys had gone out to dinner at the vicarage that evening, and would not return until after the hour at which Elsie usually retired. As soon as they got back, they would take it for granted she had gone to bed, as she always did, and would in all probability never inquire for her. If so, nothing would be known till to-morrow at breakfast. He must drop the letter into the box unperceived to-night, and then it would be delivered at Whitestrand Hall in due course by the first post to-morrow.

He shut the front window, put out the lamp, and stole quietly into the bedroom behind. That done, he opened the little lattice into the back garden, and slipped out, closing the window loosely after him, and blowing out the candle. The post-office lay just beyond the church. He walked there fast, dropped his letter in safety into the box, and turned, unseen, into the high-road once more in the dusky moonlight.

Wearied and faint and half delirious as he was after his long immersion, he couldn't even now go back to the inn to rest quietly. Elsie's image haunted him still. A strange fascination led him across the fields and through the lane to the Hall—to Elsie's last dwelling-place. He walked in by the little side-gate, the way he usually came to visit Elsie, and prowled guiltily to the back of the house. The family had evidently returned, and suspected nothing: no sign of bustle or commotion or disturbance betrayed itself anywhere: not a light showed from a single window: all

was dark and still from end to end, as if poor dead Elsie were sleeping calmly in her own little bedroom in the main building. It was close on one in the morning now. Hugh skulked and prowled around the east wing on cautious tiptoe, like a convicted burglar.

As he passed Elsie's room, all dark and empty, a mad desire seized upon him all at once to look in at the window and see how everything lay within there. At first, he had no more reason for the act in his head than that: the Plan only developed itself further as he thought of it. It wouldn't be difficult to climb to the sill by the aid of the porch and the clambering wistaria. He hesitated a moment; then remorse and curiosity finally conquered. The romantic suggestion came to him, like a dream, in his fevered and almost delirious condition: like a dream, he carried it at once into effect. Groping and feeling his way with numb fingers, dim eyes, and head that still reeled and swam in terrible giddiness from his long spell of continued asphyxia, he raised himself cautiously to the level of the sill, and prised the window open with his dead white hand. The lamp on the table, though turned down so low that he hadn't observed its glimmer from outside, was still alight and burning faintly. He turned it up just far enough to see through the gloom his way about the bedroom. The door was closed, but not locked. He twisted the key noiselessly with dexterous pressure, so as to leave it fastened from the inside.—That was a clever touch!—They would think Elsie had climbed out of the window.

A few letters and things lay loose about the room. The devil within him was revelling now in hideous suggestions. Why not make everything clear behind him? He gathered them up and stuck them in his pocket. Elsie's small black leather bag stood on a wooden frame in the far corner. He pushed into it hastily the nightdress on the bed, the brush and comb, and a few selected articles of underclothing from the chest of drawers by the tiled fireplace. The drawers themselves he left sedulously open. It argued haste. If you choose to play for a high stake, you must play boldly, but you must play well. Hugh never for a moment concealed from himself the fact that the adversary against whom he was playing now was the public hangman, and that his own neck was the stake at issue.

If ever it was discovered that Elsie was drowned, all the world, including the enlightened British jury—twelve butchers and bakers and candlestick-makers, selected at random from the Whitestrand rabble, he said to himself angrily—would draw the inevitable inference for themselves that Hugh had murdered her. His own neck was the stake at issue—his own neck, and honour and honesty.

He glanced around the room with an approving eye once more. It was capital! Splendid! Everything was indeed in most admired disorder. The very spot it looked, in truth, from which a girl had escaped in a breathless hurry. He left the lamp still burning at half-height: that fitted well; lowered the bag by a piece of tape to the garden below; littered a few stray handkerchiefs and lace bodices loosely on the floor; and crawling out of the window with anxious care, tried to let himself down hand over hand by a branch

of the wistaria. The branch snapped short with an ugly crack; and Hugh found himself one second later on the shrubbery below, bruised and shaken.

SCOTCH BANKING AS A PROFESSION.

BANK CLERKS.

WHEN a young man has left school and is about to enter the world, his parents or guardians ask themselves the anxious question: 'What is the most suitable occupation he can follow?' Assuming that they have decided in favour of the banking profession, as it is termed, we propose to give some practical notanda which may be of use to those who purpose entering the service of a bank.

In glancing around at the different fields for employment, we cannot but observe how severe is the struggle for subsistence, and how every trade and every occupation is overrun by competitors. Co-operative Associations are seriously injuring traders' establishments, and the middleman is being pushed out of the way, the consumer preferring to deal directly with the producer. The greater the number of persons seeking employment, the smaller will be the amount of remuneration for their labour; and in estimating the value of banking as a profession, we have to bear in mind that clerks form a very numerous class in the community, and that they are day by day becoming more numerous, being now largely recruited from the working and trades classes, who are naturally striving to reap the benefits of the liberal education which is being bestowed on their families. Dr Johnson says that it is 'the dignity of danger' which gives to the profession of arms its charm. In the case of banking, it is the responsibility attached to money-dealing which elevates it above the traffic in less valuable materials, though the labour itself may not demand in many cases much skill. Mr John Stuart Mill does not rate highly the commercial value of a clerk's work, judged by the quality of the work itself, or the demands it makes on the skill of the individual. He says: 'The higher rate of a clerk's remuneration must be partly ascribed to monopoly, the small degree of education required being not yet so generally diffused as to call forth the natural number of competitors; and partly to the remaining influences of an ancient custom, which requires that clerks should maintain the dress and appearance of a more highly-paid class.' And he adds: 'It is usual to pay greatly beyond the market-price of their labour all persons in whom the employer wishes to place peculiar trust, or from whom he requires something besides their mere services. Similar feelings operate in the minds of men in business with respect to their clerks.'

What Mr Mill has said as to the limitation of clerks from the non-diffusion of education cannot hold good in our day. The market for clerks is largely overstocked, and the occupation itself, from the light nature of its duties, lends itself readily to a glut of competitors. Moreover, the female element has now come into play in the struggle for life, and threatens to become a most potent factor in the field of employment. That this has to be reckoned with in the future of banking may be inferred from what the President

of the Institute of Bankers in Scotland stated some years ago in a public lecture to that body, that since female clerks were now employed in the post-offices of the government, he did not see why they should not be employed in banks as well. The employment of female clerks has the recommendation of cheapness; and, other things being equal, in days of economy it may come to be utilised.

Having stated these few general considerations, we shall now regard the subject more closely and practically.

So far as the Scotch banks are concerned, they seem to prefer young men of about sixteen years of age, without physical defect, and of good character. They must be recommended by some one known to, and of influence with, the bank. The name of the applicant is inserted in a book to await his turn for a vacancy. When this turn arrives, he is usually subjected to an examination in arithmetic and writing to dictation. The present examination is not severe; but we believe it is proposed to extend it to four subjects—arithmetic, algebra, geography, and English composition, which are the four educational non-banking subjects on which competitors are examined for the degree of Associate in the Institute of Bankers in Scotland. Good writing is a great requisite for success in banking, as it brings its possessor a better class of work. Unfortunately, speed is often demanded, especially in big branches, and this tends to injure the penmanship. An applicant will do well, then, to study to have a clear caligraphy and to be able to sum well. On admission to the service of some of the banks, one is obliged to give them security, either personal or by bond of the bank's or other Guarantee Association, for which a payment of twenty shillings per cent. is exacted in annual instalments.

The period of apprenticeship with the Scotch banks is usually three years, a small consideration being given therefor. At the end of that term, the apprentice naturally expects to fledge into a clerk; but we believe the practice is coming into vogue of allowing the apprentice to remain as such until there is a vacant clerkship for him to fill. Should he not give promise during his apprenticeship of proving to be a serviceable clerk, he will not be retained.

The best place to begin banking is a country branch, where one is allowed to take up in turn every department of branch banking and to see everything with one's own eyes. In a head office, a youth is apt to be kept at one particular kind of work for a year or more, and thus very little comes under his observation. The branch-bred clerks are the best trained and the best fitted to fill those vacancies in foreign banks for which the home banks are so often put in requisition.

To make a mark early in banking, one should go abroad as soon after the period of apprenticeship as possible, and then, health remaining good, it is simply a matter of a little time to rise in the profession. In the foreign field, especially in China, the East and West Indies, the climate is so trying that contingencies may arise in which a bank clerk is called upon at short notice to replace his comrade, of whom he hears that 'he was dining with a friend last night, but is dead and buried this morning.' This is only too true of many

who fall victims partly to the climate and partly to indiscretion; for in the East, heavy penalties are exacted for neglect of nature's laws. But we mention this rather to show how a banker has a better chance abroad of rising in his profession by reason of these frequently recurring climatic casualties, than to deter those who would seek to gain distinction in the service of foreign banks.

In India, a junior clerk may, after passing a medical and preliminary knowledge examination—the latter is often not insisted on where the clerk is known favourably in his own bank—expect a salary beginning with two hundred and fifty pounds along with free apartments and free passage out. When he arrives there, he will find banking conditions altered. His 'masters' treat him differently from those in Old Scotland; they joke with him, and allow full scope to his individuality by consulting him as a friend rather than as a subordinate. The reason for this is, perhaps, partly the increased intercommunity of feeling engendered by the fact of both being fellow-countrymen in a strange land. Be this as it may, they seem in India to have bridged that gulf which in a great Scottish banking institution separates the chief from the underling.

In Canada, a large field opens out to the bank clerk, and an initial salary of two hundred odd pounds is often allowed along with a free passage. One advantage is, that a banker may obtain a partnership in a wealthy commercial business from the repute he enjoys as a banker, and so exchange his limited emoluments for unlimited gains. In British South Africa, there is room for the bank clerk; but as affairs there have not been in a prosperous state through native wars, Boer difficulties, colonial embarrassments, &c., it does not present so good a field. South African bankers have been wisely retrenching till times improve. Posts in Africa were lately offered to clerks from Scotch banks for a term of from three to five years. Although the engagement was thus limited, the clerks expected, from the hopes held out to them on admission, that the bank might retain their services at the expiry of the period. Unfortunately, in many cases the bank was obliged to give them notice to quit; and any one who knows the difficulty of finding work in Africa for those who, in Lamb's words, 'suck their sustenance through a quill,' will understand the nature of the hardships undergone by such in their quest for employment.

But to revert to Scotch banking, which we only quitted to point out the foreign fields which lie open to the bank clerk, and which lead more quickly and more directly to distinction than the home field. The number of bank employees in Scotland is roughly reckoned at six thousand five hundred. Of these, one large bank alone possesses more than one-ninth. The clerks of course are by far the most numerous class, standing in the ratio of about five to one to the official body. As to salaries allowed by the banks, the tendency has been lately to retrench, as money has not been earning so much as it did. The percentage of profits from deposits in 1865 was twenty-three shillings and elevenpence, whereas it was only fifteen shillings and fourpence in 1886. This shows the need for an all-round economy in the charges of a bank; for salaries form by far the largest proportion of the entire expenses. More-

over, salaries are permanent charges, which, if raised, cannot easily be cut down; and banks can only give effect to economy on the death of the holder of a lucrative office, or by the transfer from one post to another, or by the stoppage of additions to salaries. Some of them have adopted a system of grades, similar to that which obtains in government circles, and have assorted their clerks into three distinct grades, the relegation to a grade entitling the 'graded' to a fixed advance every one or two years, as the case may be. There are exceptions made in special cases where the responsibility is greater and the work more onerous than usual. Bank tellers, from the nature of their duties, are allotted to a special grade. Several banks exact payment for a teller's losses, while others allow him an annual sum to provide against all such, which sum he may pocket if his intromissions have not been on the losing side. But the rise of any one in a bank, whether there be grades or not, is mainly dependent on the man himself. Influence may put him in a position to help himself; but he alone must find the intelligence, the fidelity, and the zeal, if he would rise in his profession. As a good work to study, 'Gilbart' has been highly recommended to young bankers, since it gives the best account of the theory and practice of banking.

If a Scotch bank clerk would excel his neighbour, he would do well to qualify himself for the degrees of the Bankers' Institute, which are alike tests of his general and professional knowledge. The subjects for the Associate's degree in the Bankers' Institute are—arithmetic, algebra (up to and including quadratic equations), geography, English composition, book-keeping and bank books, exchange and clearing-house system and rules, note circulation, interest and charges, negotiation of bills and cheques, history and present position of banking in Scotland. For admission as members, the subjects are—principles of political economy, stocks and Stock Exchange transactions, history and principles of banking and currency, theory and practice of the foreign exchanges, principles of Scots law and conveyancing, law of bankruptcy, mercantile law, law of bills, cheques, and receipts, &c. And in practical banking the following subjects: correspondence, branch supervision and advances. The total value of a candidate's answers must be not less than sixty per cent. of the value of such questions. To obtain a degree with honours, the candidate has to submit to a further examination in French or German, British history, British constitution and government, English literature, and outlines of general history, and to make sixty marks in each of these subjects.

These, it must be confessed, form a pretty severe test of a candidate's scholastic and professional proficiency, and so it may be asked: Are these certificates of service to a bank clerk? Are they recognised by his superiors? It is not easy to answer these questions categorically, or to define the precise value which is attached by the different banks to the holding of these diplomas. In estimating the general fitness of a clerk when promotion is in prospect, it is not at all likely that the bank would ignore the possession of such a voucher of knowledge. They will take it into account; and it may be that it will turn the scales against contending competitors

who have gained no such distinction. Whatever may be its home value, there is no doubt that in the colonies the diplomas of the Bankers' Institute are highly prized, and have secured for their holders bank appointments on various occasions. In addition, Bankers' Institutes are being launched in the antipodes, with a view to promote the education of the banking employees there. The certificated clerk who finds his degree fail him at home, must fall back on the reflection that 'knowledge is its own reward.'

One great benefit to be obtained by being in the service of some of the banks arises from the connection which is formed with the 'Widows' Funds,' which provide, by way of annuity, for the widows and families of bank officials on the fund. This connection is with some banks compulsory, with others voluntary. The payments made by contributors are small, indeed, as compared with the benefits which accrue in the form of annuities, ranging as these do from forty to a hundred pounds. These funds represent the accumulations of years, and they have been wisely fostered and administered by the banks for the behoof of those for whom the funds exist, as the banks have found the annuities to prove a powerful supplement to the pensions which they pay after long service to the retired members of their staff. This leads us to the subject of bank pensions, which are now being granted very much on the lines laid down by the government in the Civil Service Department—namely, the two-thirds principle for full retirement allowances.

If it be asked, what is the main advantage to be gained by being in a bank? we would reply, that it does not consist in the extent of remuneration or the rate of promotion, for the first is small, and the second slow—but in the tenure of office, which is a life one, being practically *ad vitam aut culpam*. It should, however, be stated that there is no legal obligation on the part of the bank to retain any one in their service on such a tenure, though, as yet, they have shown no disposition to cut adrift any member of their staff who is at all fit for his work. This life-tenure has lately fled the School Boards, and so there is no saying what banks in the future may have to do. Another advantage lies in the opportunity afforded a bank clerk of rising to the pinnacle of his profession. What was said of the French soldier in Napoleon's time applies to him—that 'he carries in his knapsack the baton of a field-marshal.' This assertion is amply attested by the fact that many of the highest officials in Edinburgh banks have passed through all the ranks from apprentice upwards to their present honourable and responsible position. There is no post, therefore, to which a clerk may not aspire, or from which he will be excluded, if he but show the necessary fitness both on the moral and intellectual side of things.

As to the nature of bank-work, we would remark that there is a vast amount of routine in the 'trivial round, the common task,' which tends to intellectual monotony and takes away the incentive to thought. This is particularly the case with the clerk who keeps the same ledger year after year and balances the same class of accounts. Notwithstanding, whatever be the class of work a bank clerk has to perform, he should learn to regard nothing in the way of duty as

'common or unclean;' for if any part of his work be incorrect, it may throw out of gear the whole machinery of the bank.

As to bank hours, they are certainly short, being from half-past nine to four—in 1823 they were from nine to three, and six to eight evening—but these do not represent the entire working time. They leave, however, to those so minded, ample leisure and sufficient scope for the cultivation of such hobbies as music, painting, sketching, photography, &c. We should like, when on the subject of bank hours, to state, by way of *caveat*, that the banks on this matter, as well as on other matters, are becoming more commercially minded. One bank has adopted the following plan: At one of their largest offices they have divided the staff into sections. When any member or members of a section are absent, the remaining members of that section must assume the duties and perform the work of the absent members, whether or not it entail coming back at night to overtake the arrears of work caused by such absences. It is well, then, to bear in mind that things may not always be as they have been, and that even conservatively disposed banks may change their ways.

To those desirous of entering a bank, we would say: Weigh well all the *pros* and *cons*; bear in mind that promotion is necessarily slow, the work unexciting and often monotonous; and that the great objections to banking as a field for employment and emolument are these: (1) It has very few posts at its disposal, and for these there is always a disproportionate and daily increasing number of candidates; and (2) it offers a very limited amount of remuneration, not as compared with the pay of clerks generally, but considered relatively to the superior social status which, by popular consensus, has been accorded to all those in whom a bank has confided its trust.

IN DANGER'S WAY: A TALE OF TWO HEROES.

CHAPTER II.—RIVALRY.

THE sun had set; the clear sky grew bright with stars, as the night began to creep over the sea and land. The wind had fallen, but a breeze still blew across the cliff.

Max Von Rôin began to read in a low, distinct voice: 'When these lines reach you, dear Miss Cora, I shall be no more.' And at the passage describing the diamond 'as big as a split walnut,' he caught his breath and his voice faltered; and when he had finished the letter and was handing it back to Cora, she observed a look on his face that puzzled her—a look of keen determination.

'Where did this come from?' said Stephen Walsh, approaching Cora, and taking the letter from her and looking at it suspiciously.

'Max Von Rôin picked it up at sea,' said the girl, 'this afternoon;' and she related the details; for the young sailor remained silent and lost in thought.

'It was this, then,' said Walsh, glancing at Von Rôin, 'that brought you back? I saw you enter the harbour; I was on board my yacht. I was wondering what motive'—

'None other than this;' and Max Von Rönin flashed a look at his rival.—'And now,' he added, 'I'll start again for Shingle Point.'

'To-night?' said Cora. 'It is getting dark.'

'There'll be moonlight in an hour's time. Good-night.'

As the young sailor passed out at the gate and reached the top of the steps, he could not refrain from glancing back. Stephen Walsh had thrown himself down on the bench at Cora's side, where Max had been seated a moment before. Max stopped no longer; he went down the steps with great precipitation, and ran across the sands towards the harbour. He did not slacken his pace until he reached the quay and came alongside the *Loadstar*. It had now grown dusk. As he stepped on deck, he noticed a light in Captain Satchell's cabin. He hurried below.

'Why Max, my lad, you're winded. What now?' said the captain. He was seated at supper. He put down his knife and fork, and stared inquiringly at the first-mate.

Max Von Rönin was too much out of breath to speak.

'Drink a drop of water;' and the captain pointed to a large bottle on the table before him, 'and take your time. Something's upset you.'

The young sailor obeyed, and soon recovered speech. 'Captain,' said he, 'I've read it—every word!'

Satchell nodded. Max related the substance of Honywood's letter to Cora. 'And now, captain,' he added, 'I've a favour to ask you.'

Captain Satchell's face wrinkled with prophetic smiles. 'I think I know what's in the wind. You want to go in search of this wreck. Ain't that it?'

'I want a week's leave,' said Von Rönin evasively. 'I want you, if you'll be so kind,' he added, 'to let it be supposed that I've gone to stay at Shingle Point. I wouldn't have it thought!'

'Ay, ay,' said the captain with a knowing look. 'When do you want to start?'

'Now.'

'Without your supper?'

'I'm not hungry.'

'You will be. Put some rations on board,' said Captain Satchell.—'You'll not reach Shingle Point much afore midnight. The tide's on the turn, and the wind's not rising.—Well, good-bye, my lad, and good-luck to you.'

Once more Max Von Rönin's light skiff, passing between the walls of the jetty, reached the open sea. It was now night; but the western sky was shimmering with faint indications of moonlight. The wind had fallen almost to a dead calm; and the young sailor, who in his impatience would have preferred a gale to the faint breeze that was now blowing, needed all the fortitude he could muster in order to endure the creeping pace at which his boat advanced with the tide. It would be worse presently, he reflected, when the current changed; and unless the wind stiffened, he even feared that it would be nearly impossible to make any headway at all. There was a ground-swell; and the sound of the waves breaking upon the beach almost maddened him; and he began to steer farther to seaward, to get out of earshot of what appeared like mocking laughter—the

laughter of Stephen Walsh. Even the red light which had begun its revolutions at the jetty head irritated Max Von Rönin, when he glanced in that direction and found that it was not growing so dim in the distance as he would wish.

Presently, the moon began to rise into the clear sky, and Max, sailing in the glimmering path of light—a path that might have been formed on the waves by the tread of angels' feet—felt that a breath of wind was springing up and slowly improving his speed in spite of the tide, which was now flowing fast. His spirits rose with every leap of the boat; his look of resolution increased. He would not rest until he had learnt upon what coast Abel Honywood's ship the *Cora* had been wrecked: it had been surmised that the vessel had gone down at some rocky point off the Channel Islands in no very great depth of sea; and the young sailor, reflecting over this, determined to find his way to the captain's locker and get possession of this diamond, that might win for him the heart of Cora Norland.

Looking back towards the harbour, after a long interval—to measure his distance once more from the red light—he suddenly caught his breath like one who has received a keen stab. He uttered a fierce cry, and almost let the rudder fall from his grasp.

Stephen Walsh had realised for the first time, while seated beside Cora, that Max Von Rönin was a serious rival. Hitherto, he had looked upon him as a common sailor in the ship-owner's employ, who had been 'noticed' by the family since childhood. But this afternoon something in Cora's manner, as well as Von Rönin's, had roused his suspicions; and a feeling of hatred sprang up within him—hatred awakened by jealousy—towards the mate of the *Loadstar*, and he shook with suppressed anger. Cora must have remarked the change in his face—for even his lips had grown livid—had not Abel Honywood's letter, which she still held in her hand, absorbed her attention. It was beginning to dawn upon Walsh, though vaguely as yet, that this letter would sooner or later be the cause of some catastrophe—a catastrophe which it would be out of any one's power to avert.

Presently, Cora spoke, but without lifting her head: 'Are you superstitious?'

'No,' he answered, with a quick glance at her face.—'Are you?'

'Yes. I believe in this tradition. I like to believe in it. It's romantic; it pleases me.'

'About this diamond? Why, it's lost, Miss Norland,' said Walsh. 'It's beyond any one's reach.'

The girl raised her eyes suddenly to his face: 'How do you know that?'

Walsh made no reply: he feared to betray his anger; for her manner convinced him that she was thinking, when she spoke of the tradition, about Von Rönin; and as she sat there motionless, looking fixedly before her into the gathering twilight, he raised his hand expressively, as though he longed to clutch Honywood's letter and fling it over the cliff and into the sea, whence it had so lately come.

Suddenly Cora rose from the bench. 'Don't let us talk about this any more at present. I

must go in now; father will be expecting me.—Won't you stay,' the girl hastened to add, 'and take some supper with us?'

Stephen Walsh's face brightened: he gladly accepted the invitation; for his one object for months past, while cruising about the waters of Southsea Bay, had been to gain Cora's affections. He had inherited some property in the neighbourhood, worth a few hundred pounds a year; and being a man of luxurious and lazy habits, he had determined to make life still easier by forming a good match. At a regatta, last season, he had made Cora's acquaintance; and he had fallen in love upon hearing that she was the daughter of a rich ship-owner; and it soon became obvious to Walsh that if Cora did not greatly encourage his attentions, Mr Norland would by no means oppose him. Stephen Walsh belonged to a good family; and he shrewdly conjectured that the ship-owner, like most parvenus, would be flattered at the prospect of becoming connected by marriage with the landed gentry. Mr Norland, as he knew, had lately purchased an estate along the coast; for with all his love of the sea—as his friends facetiously remarked—he never 'lost sight of land,' when a favourable opportunity of purchasing presented itself.

The ship-owner and Stephen Walsh had seated themselves on the terrace outside the dining-room window, when supper was over; and Cora had wandered out into the grounds, leaving them to chat over their cigars. Mr Norland was still in a depressed and restless mood; he rose frequently from his chair, paced up and down, and then again threw himself into his seat with a word of apology. 'The fact is, Mr Walsh, the loss of the *Cora* has terribly upset me. I had a great liking for Abel Honeywood. And,' he added, 'excepting old Satchell, he was the best captain I ever had.—You saw his letter to my daughter; he added abruptly—'the one Von Roïn picked up off the coast?'

'I've read it.—What's your opinion, Mr Norland, about this diamond? *My* opinion is,' continued Walsh, 'that it's better where it is—under the sea.'

'Is it, though?' said the ship-owner with a look of surprise. 'Why?'

'Better there,' answered Walsh in a meaning tone, 'than in bad hands.—Not that I intend by that,' he hastened to add, 'to refer to Abel Honeywood; quite the contrary. Did you suspect, before this letter was picked up, that Honeywood loved your daughter?'

'No. How should I?—Poor fellow,' said the shipowner. 'He—— Why do you ask the question?'

'Because,' said Stephen Walsh with assurance, 'this affair—and one other little incident—have made me fear that if I delay speaking to you on a matter that very nearly concerns my happiness, I shall be too late.'

'Eh?'

'I love your daughter, Mr Norland, and I would ask your leave to speak to her,' said Walsh. 'I need scarcely tell you, sir, that my position'—

'Tut, tut! Do you suppose that I should have invited you to my house, my dear boy, if I had any objection to your courting my daughter?—Give me your hand!—And now,' said the ship-

owner heartily, 'go and ask Cora what she has to say. You have my full consent.'

Walsh pressed the hand held out to him and muttered his thanks. As he was turning away to join Cora, Mr Norland called him back.

'Stay. I want to ask you a question. What did you mean when you spoke just now about bad hands?'

'Bad? I meant dangerous. It's my duty to warn you,' said Walsh significantly. 'Some one else—at least so I suspect—loves your daughter. And if that diamond, which Honeywood speaks of, gets into that fellow's hands'—

'Whose? Name the man.'

'Max Von Roïn.'

The ship-owner stared incredulously at Stephen Walsh; the announcement seemed to take his breath away.

'Von Roïn! Are you serious?'

'Serious, Mr Norland? I never was more serious in my life.'

Mr Norland's broad shoulders began to shake with laughter. 'No, no; it's your fancy.—Von Roïn in love with my daughter? You're jealous—you're unreasonable. Max Von Roïn is an able seaman—I admit that—a brave, honest fellow. But he would never presume to make love to Cora. He knows his position better, I should hope, than to do that.'

Did Mr Norland forget that he had been a mate himself and as poor as Max Von Roïn? Possibly not. But a self-made man is apt to try to hide from others what he cannot hide from himself—that he once knew days of poverty, days when he had thoughts not less ambitious.

Meanwhile, Cora, leaning against the low fence, looked intently seaward. It was at the moment when the boat, with Max Von Roïn in the stern, passed out of the harbour. The girl was watching with eagerness its difficult manœuvres. Her face at first expressed impatience; but her eyes began to brighten when the young seaman steered away from the shore, out of the calm and sheltering bay, and got some wind into his sail. Could she have guessed Von Roïn's project already?

Coming across the lawn from his talk with Mr Norland, Stephen Walsh comprehended the situation at a glance. It was as he had dreaded: his suspicions were as good as confirmed. He stopped as if transfixed, with clenched hands and flashing eyes. Max Von Roïn had outwitted him; he had better understood Cora's impulsive mood, her superstitious mind, and her romantic belief in this senseless tradition. He had started on his search after the shipwreck to please this girl; and she knew of his intention as surely as if he had spoken at the moment of leaving her after the reading of Honeywood's letter. These thoughts, passing rapidly through Walsh's mind, almost maddened him. He had always had his own way in life; and this opposition—this tacit rivalry on the part of one whom he hated and despised—was more goading than if he had received an open insult. But he quickly mastered his passion, and reached Cora's side: he kept his face always in shadow, lest it should betray him. He then spoke to her in a low voice: 'Miss Norland—Cora: I love you.'

She did not look round; she kept her eyes bent upon the boat; and but for the quivering

lips and the quickened breathing, he might have doubted whether she had heard him.

'I have spoken; I have gained your father's leave to ask you to be my wife,' continued Stephen Walsh desperately. 'I have longed to tell you for months past that there is nothing I would not do to gain your love.'

'Nothing?' and Cora glanced swiftly into his face. 'That is a bold assertion.'

'Then let me repeat'—

'No! If you are in earnest, listen to me.'

Stephen Walsh stood silent, waiting for her to speak.

'Do you see that boat?' said the girl.

Did he see it? With what difficulty he suppressed the angry words that rose to his lips! Restraining himself by a painful effort, he answered: 'Yes. It belongs to Max Von Roïn.'

The wind was rising; and as Stephen Walsh spoke, the skiff passed swiftly through the broad path of moonlight, and Von Roïn's figure was distinctly visible at the helm, energetic in expression, the head and shoulders bent forward.

'Something whispers to me,' said Cora musingly—'shall we call it the spirit of Abel Honywood?—something assures me that Max Von Roïn will not rest until he has found the wreck.'

'You mean the diamond,' said Walsh, choking with passion.

'I mean that Von Roïn has some romance in his nature. Prove that you have too. A woman's love cannot be won without it.—Where is your yacht?'

'You know. She is lying'—

'At anchor? She should be there;' and Cora pointed towards the sea, beyond Von Roïn's boat.

'Would not that show you wished, by deeds, not words, to win my love?'

'Are you serious?'

'I was never more so. Good-night.' In a moment she was gone.

Stephen Walsh turned away and went down the steps and along the bay, as Max Von Roïn had done. His rage was ungovernable now. She had spoken of Von Roïn as her possible lover; she had named him, as she pointed out his boat, while he, Stephen Walsh, was asking her to be his wife! He stopped suddenly and cast a threatening look towards Von Roïn's skiff: it was sailing along rapidly between him and the horizon. He even sprang with a menacing gesture to the very edge of the sea, where an incoming wave lifted up its foaming crest and forced him to step quickly backwards. The sea shivered in the moonlight, and the wave broke with a hissing whisper as he turned and went hastily on his way towards the harbour.

On the staircase, Cora met her father.

'Well, my dear,' said he, 'what has Mr Walsh been talking about so earnestly?'

'He has asked me, father, to be his wife.'

'Come! That's indeed an honour. The young man belongs to a very respectable and highly connected family.'

'He is a man of good birth: his proposal is of course very flattering,' said the girl.

'Did you tell him so?'

'I told him,' said Cora—'I led him at least to believe—that he might hope.'

The ship-owner smiled and patted his daughter's

cheek. He did not appear quite satisfied; but he simply said: 'Well, well. A very pretty commencement. You must give him a little gold anchor, my dear, to wear on his chain.'

'Yes, father. If he finds the diamond, I will.'

'What is that?'

'Please, don't question me now. He will tell you; he understands what I mean.'

When Cora reached her own room—the room in which she had since childhood listened to the sound of the waves below the cliff, and marvelled often at the perils and dangers of the deep sea—she began to reflect upon all that she had been saying to Stephen Walsh. What reason had she to surmise that Max Von Roïn had gone in search of the wreck? His mother lived at Shingle Point, and he had gone to visit her. And yet something had whispered—she had called it the spirit of Abel Honywood—that Von Roïn loved her, and would never return unless he found the diamond. The fancy clung to her; she could not cast it off.

If he found it—and the thought brought a blush to her cheek—could she refuse, if he asked her to be his wife? And yet she had encouraged Stephen Walsh. But would he, a man without an atom of romance in his nature, go on this perilous errand, even in the hope of winning her love?

Presently Cora ran to the window, drew the curtains aside and looked out upon the broad surface of moonlit sea. She opened the window wide; the wind blew roughly in her face; the sea was covered with white restless breakers. Max Von Roïn's sail was still in sight—a tiny speck, that any but an accustomed eye would have mistaken for a wave. But close at hand—passing swiftly by the cliff below her window—was a trimly built yacht, and Stephen Walsh was on board; she saw him distinctly at the helm; and a strong wind was carrying the yacht rapidly along in the direction of Shingle Point.

Cora's heart beat painfully with a vague sense of dread at what she had done. She hastily closed the window and drew the curtain, to shut out the moonlit night. But she could not shut out the sound of the wind, and of the waves breaking below the cliff; and in the whisper that still came from the sea, she knew that it would be her destiny to wed the man who found the diamond, should he ask her to be his wife.

COMPOSITE PHOTOGRAPHS.

WE have constant evidence that the applications of the beautiful art of photography are increasing; and we may broadly state that there is now hardly any branch of science or art in which it is not made use of to some extent. Indeed, it is often said that photography is the handmaid to science; and the more we consider the matter, the more do we see the aptness of this description. The astronomer now depends on photography to make star maps of far greater accuracy than is possible by the human hand, for the simple reason, that the photographic lens is able to depict stars so distant that their light cannot be appreciated by the human eye even when aided by the most powerful telescope. The microscopist also uses photography to a great extent; and here again this wonderful art of sun-

painting is more exact than the work of the most careful draughtsman. In times gone by, when it became necessary to draw a microscopic object, the man who undertook the work was sure to confer upon his drawing that individuality from which no artist is exempt; so that, supposing that two different hands were detailed to make a drawing of the same object, the pictures would be essentially different in treatment and general appearance. We know that this is not the case with photography. We may take a dozen different photographs of the same object, and each one will be an exact reproduction of its fellow. Photography is also coming into use for the illustration of books and newspapers, and in this field of labour it has had an unfortunate effect of acting as a powerful rival to the engraver. The photographic camera has of late years enabled the man of science to study the movements of animals in a way that our forefathers would have deemed impossible. In a word, photography is throwing a flood of light upon various things and phenomena, scientific and artistic, and has been successful in detecting certain operations of nature that without its aid would perhaps have remained for ever unknown.

It is now ten years since Mr Francis Galton pointed out a new application of photography. In his address to the British Association in 1877, he first proposed the taking of what are called composite photographs; and it will be best if we explain in his own words the rough groundwork of the process which he originated: 'Having obtained drawings or photographs of several persons alike in most respects, but differing in minor details, what sure method is there of extracting the typical characteristic from them? I may mention a plan which had occurred both to Mr Herbert Spencer and myself, the principle of which is to superimpose optically the various drawings and to accept the aggregate result. Mr Spencer suggested to me in conversation that the drawings reduced to the same scale might be traced on separate pieces of transparent paper, and secured one upon another, and then held between the eye and the light. I have attempted this with some success. My own idea was to throw faint images of the several portraits in succession upon the same sensitised photographic plate.'

In order that we may better understand the advantage of this method of procuring type-pictures from different individuals, let us suppose that a competent artist were commissioned to stand in a main thoroughfare of any large town or city, and that he were instructed to procure a type-portrait of the different persons whom he saw passing to and fro in front of him. We venture to say that in standing at a crowded spot he would see hundreds of different types of face, and he would be sure to notice, what most of us have noticed over and over again, that although the human face is arranged on the same pattern in each individual—that is to say, that each one has two eyes, a nose, and a mouth—Dame Nature has arranged these simple materials in such varied forms, and has given such wonderfully different expression to them, that no two persons are ever precisely alike. So our artist would soon see the futility of attempting a general type of all the faces that passed him, and he would probably

throw up his commission in despair. But suppose that we call a photographer in to do this work, the whole aspect of the case is at once changed; for by simple mechanical means he can procure individual portraits of suitable subjects, and then by blending these portraits together, he can obtain a kind of average result from the entire number. Such is a 'composite photograph.'

There are two or three different methods by which this result can be attained; for instance, we may take a number of paper portraits of public characters, such as one may purchase at any shop, and we can photograph these successively on the same photographic surface, so as to obtain on that surface a mixed portrait, to which all the individuals have contributed. There is a certain disadvantage in adopting this method, for the reason that one would have great difficulty in obtaining portraits of the same size and of the same pose. A better plan, therefore, is, if possible, to take photographs of the different individuals for the purpose of making a composite from them. The method which it is best to adopt is as follows: We will suppose that it is desired to obtain a composite photograph of a family of persons consisting of the father and mother and, say, six children. Our first duty will be to calculate exactly for how long a time the sensitive plate in the camera must be exposed to the action of light for each individual. If the sensitive plate will under ordinary circumstances require an exposure of, say, sixteen seconds for one portrait, then this time must be divided by eight, the number of individuals who are to compose our composite photograph, and therefore each individual must be photographed for two seconds only. The ordinary camera is used; and upon the ground-glass screen at its back upon which objects are focused, certain lines must be drawn with a pencil as a preliminary operation. One line will be vertical, marking the position of the nose; and there will be two horizontal lines crossing this one; the upper one indicating the position of the eyes, and the lower one that of the mouth. We may now proceed to the work in hand. Each sitter in turn sits upon a music-stool in front of the camera, this seat being chosen because it can readily be raised or lowered on its screw, so as to suit the different heights of the sitters, whose eyes must always be brought exactly to the same height from the ground. A simple form of head-rest, consisting of a vertical rod with a horizontal piece at the top, must be at hand, so that the top of each person's head may be brought to exactly the same altitude. Sitter number one is now placed before the camera and focused accurately to the pencil-marks on the ground-glass screen. The camera is uncapped for two seconds, when the lens is again covered. The second sitter now takes his or her place on the music-stool, which is screwed up or down to the required height, as the case may be, and once more the lens is uncapped for two seconds. And so on until all the eight sitters have successively sat in front of the camera and have contributed their two seconds of attention to the sensitive plate within. This plate is now taken to the photographer's dark room and is developed in the usual way so as to produce a negative. But what a curiosity this negative is: it represents a

picture of a being that really does not exist as an individual at all, but the component parts of whose features are found in eight different human beings. Such a negative can, when finished, be made to furnish as many positive prints on paper as may be required.

A very curious point in photographs so obtained is, that almost invariably this combined picture is that of a better-looking person than any of the individuals who have contributed to it. Some of these photographs now lie before us. Here is one which has been taken from a number of criminals, and, as we have just indicated, the picture is much better favoured than the various low-browed, coarse-mouthed individuals who have contributed to make it up. Another picture we may call attention to as being a great contrast to the last; this is a group of ten girls who are the members of a literary club. The picture is that of a bright-looking intellectual girl of about nineteen years of age. The face is thoughtful, and the shape of the head indicates great intellectual power. The same observations are applicable to another photograph which is before us, to which several scientific men have contributed each his share. Two more composite photographs which we have are not so good as the others, because they have been taken from portraits of political characters whose pictures it would have been impossible to obtain for the purpose to which these have been put. The pictures therefore suffer to some extent from the difference of position and size, a difficulty to which we have already alluded. The photographer who took these portraits informed us that his first idea was to divide the politicians into Conservatives and Liberals; but he found that in the present state of affairs this was a task far beyond his powers or the powers of anybody else. He therefore divided them into Gladstonian Liberals and Unionists; and in order that we may not be considered partial critics of either, we may at once say that neither of these composite political portraits gives a result upon which the politicians can be complimented; still, they are very curious productions.

It may now be asked, what is the use of this new application of photography? Mr Galton, who originated it, believes that it might be turned to great practical use in producing types of different tribes or races, and we are disposed to think that very useful work might be done in this way. A book upon the subject has lately been published in France, in which certain examples are given, showing how well the general features of different tribes of persons are averaged by means of these composite photographs. There is another field of work in which it might be useful. We know that portraits and sculptures of eminent men who lived in ages long gone by have been preserved to us; but we cannot tell how far these different portraits have been affected by that individuality to which every artist is prone, and to which we have already adverted. Would it not be possible to collect these different portraits, say, for example, those of Julius Cæsar, and to combine them by means of this composite method? We venture to assert, from what has been done in this comparatively new art of composite photography, that we should be likely to obtain by such means a truer portrait of the man than has yet been

seen. The whole subject is full of interest, and there is no doubt that in the near future a great many workers will be attracted to it, and that as a result it will improve and grow in usefulness.

A PARSON'S FIXES.

HERE is the first pastoral fix I was ever in. One wintry Sunday evening I was officiating, for the first time, at a mission church in an outlying part of the parish. The building had been a dissenting chapel. The pulpit, a formidable but rickety structure, was approached by a high and shaky flight of steps, and was illuminated by two tallow candles in tin sconces, on either side of the preacher. I had observed some slight unsteadiness on the part of the friendly dips, and accordingly had at first moved about as little as possible. However, as the sermon went on, caution was forgotten, and warming with my subject, I began to indulge in a little oratorical action. Reaching a climax in my discourse, I lifted both my arms, and brought them suddenly down upon the deal book-board with a sharp blow. The result was that the dips bounced neatly out of the sconces, performed swift somersaults, and disappeared down below, among some females, if one might judge by the noises that ensued. By the unfeigned laugh with which my exploit was received, I presume there must have been something ridiculous in the sudden ejection and fall of the candles. However, I failed to see any humour in the situation, for I was left in the dark, and being accustomed to the written sermon, was for the moment nonplussed. I durst not look over the pulpit or ask for the candles, and my rustic audience were so lost in the fun of the incident as to forget how necessary light is to a man's teaching. I made a brief effort at extempore preaching, and then an early and ignominious exit.

My next fix occurred in a large and ugly town church where I was conducting a week-evening service. It was summer-time, and the church doors were open. I was standing at the lectern reading the lessons, when my eye caught through the doorway the figure of Carlo, a large black spaniel, with which I was on friendly terms. The recognition was mutual. My acquaintance trotted up the aisle, and brought himself to anchor a few feet in front of where I was standing. He watched me with close attention, evidently wondering at my unfamiliar garb and estranged manner, but in doubt whether to manifest recognition by jumping up alongside me, or by indulging in friendly barks from a distance. However, he compromised matters by thumping audibly with his tail on the church floor, to the amusement of some of the younger members of the congregation, who eyed him with infinite glee over the ends of their pews.

The sexton all this time was serenely watching some children playing in the churchyard—watching, with the instinct of his tribe, for the youngsters to commit some offence for which he might exact summary vengeance. He was aroused to the awkwardness of my position by a special messenger, and thereupon ensued dignified but ridiculous efforts to eject the intruder. The dog

dodged the sexton up and down the aisles, rejected his allurements and decently subdued chirrupings, now and again rolling an appealing eye upon me to stop this ridiculous trifling and come down and pat him. Finally, when the 'ssistant beadle' had joined in the chase, the creature made a bolt up the gallery stairs, and was lost to view amid the lonely waste of benches.

But the incident was not at an end. I had dismissed from my mind the imprudence of my canine friend, and the service had proceeded peacefully as far as sermon-time. Scarcely had I begun my discourse, when it became evident that some stronger attraction was engaging the attention of my audience. Lifting my eye from the manuscript, I beheld the head of the dreadful dog looking wistfully over the gallery within a few yards; and from the expression of his countenance, it was but too evident that he was calculating the nearest point from which he could reach the pulpit. No sooner did he perceive my recognition of him, than he leaped up on the seat and planted his fore-legs on the front edge of the gallery. He was triumphantly waving his tail, apparently balancing himself for the spring, when the heads of the sexton and clerk bobbed up beyond the gallery stairs. Cajolings, menacings, and subdued adjectives were heard; the dog hesitated, turned his head, took in the situation, and fled. Finally, to my intense relief, but apparently to the great regret of the juvenile element in the congregation, the 'ssistant beadle,' effecting a flank movement, seized Carlo by the tail and dragged him down the gallery stairs, to be ignominiously driven forth among the dogs of the street.

This incident reminds me of a somewhat similar one related to me by a brother clergyman. He was engaged in preaching in a country church on a hot summer afternoon, and could with difficulty keep his rustic hearers from resigning themselves to slumber. It was in a poor outlying hamlet, and the congregation had been gathered from a wide area. Many had journeyed in donkey-carts and gigs; and during service-time the animals were wont to be tethered on the adjacent village common. On a sudden the drowsy stream of the preacher's sermon was interrupted by a racket outside the building. Presently, a young donkey hobbled up the steps of the church, and nimbly trotting along the aisle, faced round, and took up a position immediately under the pulpit. Before a couple of florid farmers could be roused from their accustomed Sunday afternoon nap to drive forth the invader, another donkey, dragging a cart, lumbered up the steps to join his relative. When he had succeeded in forcing his way through the porch till the shafts and body of the cart were wedged between the pillars, finding his future passage barred, he expressed his surprise and annoyance by discharging that peculiar, reduplicated and resonant sound, which, whatever may be its meaning in animal language, seems always provocative of laughter among human beings. Like the ass which disconcerted John Gilpin, he 'sang most loud and clear;' while his salutation was responded to by the animal within the building, and heartily chorused by the congregation of asses outside. What self-composure could stand against such an attack?

I asked my friend how he comported himself

under such circumstances. He replied, that he could do nothing but lean forward upon the cushion, and looking down upon the lively scene, bide his time in silence till the unmannerly visitants had been removed, and the congregation had sobered down into a red-faced and precarious silence.

That was also an unpleasant fix in which I found myself one Sunday, some twenty years ago. I had left home rather hurriedly that morning, and just before leaving I had seized from the pocket-handkerchief box a folded square of linen, of the usual shape, size, and texture, and had transferred it to my cassock pocket. In the earlier part of my discourse, becoming conscious of an impending sneeze, and being unwilling to interrupt the even tenor of my oratory, I fished out my handkerchief with one hand, and then, in the little elegant way that most persons have, with both hands gave it a shake to release it from its folds. Having staved off the sneeze by its application, I laid it on the edge of the pulpit, when the passing of an indefinable shade of expression across the upturned faces of my nearest hearers, caused me to dart a glance towards my handkerchief, imagining that it might be slipping over the edge. My eye caught sight of a hole at one side of it which had apparently been imperfectly repaired with some lace, and I gave the thing another shake, to conceal the defect. To my dismay and confusion, two tiny sleeves and a frilled neck appeared on the confines of my 'handkerchief' and a cold thrill passed over me when I recognised the little object as being a stray part of the attire of my infant daughter. As I crammed the garment into the recesses of my pocket I thought I had never been in such a fix before; for I well knew the keenness of the feminine eye, as well as the readiness of the feminine mind to enjoy such an incident.

A story told, if I mistake not, by Dean Ramsay, had an exact counterpart in the experience of a friend who was doing duty in a little church secluded among the Wiltshire downs. As he was going into the pulpit, the churchwarden, a big burly farmer, took him aside and said: 'Measter, if 'ee doan't mind, perhaps 'ee wouldn't stomp about in the pulpit. I ha' set a turkey-hen there on thirteen eggs. Ye zee, zur, it be the quietest place in the village.'

My friend, a man of infinite humour, used to tell of his bad half-hour in that pulpit. So long as he kept his distance, the turkey-hen was peaceable enough; but whenever his legs drew too near, an angry peck would admonish him to sheer off. On the Sunday following this occurrence it fell to my lot to occupy the same pulpit. Having laughed over the incident during the week, one of my first questions was, whether the interesting bird still held her ground. To my relief, I found that the hatching had meanwhile taken place, and the coast was clear.

I was once nearly disconcerted in a like way by a cat. During the sermon I heard some faint sounds, but could not divine whence they proceeded. The congregation may not have heard them; certainly, they did not heed them. Reassured by this, I held on my oratorical way till I unfortunately moved the footstool, when there was a loud and simultaneous outcry which must have been audible throughout the building.

Looking down, I saw protruding, in an appealing fashion, three or four feeble, knobby, pink heads, followed by the maternal head, saying as plainly as feline language could speak: 'Please, do not move about in that unpleasant fashion.' Pussy had, I suppose, likewise found out that the pulpit of the parish church was one of the quietest places in the village. However, we continued very good friends till I evacuated the position.

Although not involving any particular fix, I may be allowed to say that I once knew a cat with an extraordinary fondness for funerals. One day, in a suburban cemetery, it was my duty to officiate at one of these solemn functions. Habited in my surplice, I met the body at the cemetery gates, and faced about to head the procession to the chapel. From among the bushes near the lodge, a tabby cat came forth, gravely rubbed her head against my trousers, and then marched by my side, waited at the mortuary chapel door till the procession was again formed, and accompanied us to the grave. During the service, it sat on the mound of upturned earth, or silently and stealthily crept among the mourners, purring or rubbing its sides against their garments, as if offering its dumb sympathy. At the conclusion of the ceremony it would quickly disappear in the lilac thickets hard by. My duty led me to the cemetery perhaps four or five times a week, and on nearly every occasion the cat was present. The cemetery keeper knew nothing about the animal further than that it lived in the bushes upon birds and mice, and rarely appeared except upon the occasion of funerals.

A curious case of the pursuit of preaching under difficulties came under my notice. In a country church in the remote districts of the west of England, a swarm of bees had taken up their quarters in the oaken woodwork at the back of the pulpit, to the dismay and discomfort of the weekly occupant of that structure. During the discharge of his peculiar function, he was not only annoyed with the busy sullen roar of the hive, but his fear of arousing their animosity by the loud challenge of his tones, or by the vibration of the pulpit, was stimulated by the light skirmishers which used to come out and perform all sorts of minatory manoeuvres within measurable distance of his nose. The annoyance at length became intolerable, and orders were given to smoke out the bees. This was effectually done; but, unfortunately, the clerk in smoking out the bees set fire to the church, and it was burnt to the ground.

Here notice may be taken of the dangerous mental trick of metathesis—the transposition of letters in a word—which is apt to cover with confusion even those who consider themselves perfectly safe. A writer in a late number of the *Spectator* adduced some curious examples of this pernicious habit. He cites the case of a clergyman who, wishing to say that 'we all knew what it was to have a half-formed wish in our hearts,' astonished his hearers by announcing 'that we all knew what it was to have a half-warmed fish in our hearts;' and of another, who, having 'started out' to say that 'we should not bow the knee to an idol,' arrived at the conclusion 'that we should not bow the eye to a needle.'

I can well believe these anecdotes true, for

the following instance of the failing came under my own personal observation. A fellow-student, a sensitive-minded man, who had a horror of such mistakes in public, was jokingly telling one day of a mistake which he had heard made by an illiterate man in extempore prayer. The poor fellow was praying for backsliders, but, in the earnestness of his devotion, and quite regardless of the feelings of his hearers, fell to invoking blessings upon 'black-spiders!' This tale was sufficiently amusing. But what followed? That evening, we both attended a mission meeting, and my friend took part in the devotions. He had what is called 'a gift' in extempore prayer, and, borne along upon his ardour, he seemed entirely to have forgotten the subject of the morning's conversation. An irreverent recollection did once flash upon my mind, but only to be instantly dismissed. What was my astonishment, however, to hear him, deliberately, and in a tone of confidence, make use of the very expression which he had that morning quoted, earnestly and feelingly praying for the speedy restoration and strengthening of the favoured *Arachnids*! I was sure from his manner that he was unconscious of his mistake; and nothing could exceed his mortification when he was subsequently told of it.

It was customary, some years ago—in certain districts the practice still lingers—for the minister, upon giving out the hymn, to read the first verse. I remember once hearing a young curate give out, in a very lachrymose and sentimental tone, the verse of a well-known hymn which ends with the words, 'And wipe my weeping eyes.' The pathos was sadly spoiled and the gravity of his hearers tested by his rendering it, 'And weep my wiping eyes.' He was immediately conscious of his mistake, and his confusion only made matters worse. Experience has no doubt since taught him that it is wiser, under such circumstances, to go boldly forward, trusting to successive thoughts to obliterate a little error, rather than to call attention to it by endeavouring to rectify his mistake at the time. The truth is, that unless an audience is on the *qui vive* for mistakes, the bulk of the people are much more ready to doubt whether they have heard correctly than to believe that the speaker has spoken incorrectly.

The blindness of congregations is curiously illustrated by an incident which befell me some years back. It was at a time when the question of wearing the surplice in the pulpit was much more keenly debated than it is at present. I was taking temporary duty in a midland town where the strongest Protestant spirit prevailed, and where the black gown was invested with a quasi-sanctity. One day I was talking with a leading layman connected with the parish church, a perivivid opponent of ritualism. He spoke in the strongest terms of dislike for this new-fangled idea of preaching in the surplice, and said that not only would he himself march out of church, but he believed that the majority of the congregation would follow him, if a minister were to venture to appear in the parish pulpit habited in a surplice. The remark was not made defiantly, or with the slightest *soupeçon* of suspicion as to my loyalty. The worthy man knew perfectly well that I would not needlessly wound the feelings or prejudices of my people, and that I was far more concerned with the

message of the preacher, than with the cut, colour, or material of his dress.

Little did either of us dream that an opportunity would so soon present itself to test the truth of his affirmations. Upon the very next Sunday, the mayor and corporation attended in state, and the church was crowded. The first part of the service glided by without anything calling for remark; and when I went in due course to the vestry to change my vestments, the old clerk drew back the red baize curtains, and lifting his hands, with a startled look said: 'Dear, dear, what is to be done? You've got no gown!' I remembered at once the state of the case. During the preceding week, there had been a funeral, and according to the custom of the district, I had attended in my gown, leaving this vestment afterwards at my residence, more than a mile away from the church.

What was I to do? I heard the full voice of the congregation in the church singing the hymn, measured in my mind the distance to my house, and the time it would take to sing the remaining verses. No; there was no escape for me. The surplice must be worn. When I got into the pulpit, habited in white, one of the first faces I recognised in the congregation was that of the gentleman above referred to. He looked much as usual; if anything, rather more pleasant. I addressed myself to my task; gave out the 'bidding prayer;' and, without any embarrassment or apology, announced my text, and proceeded with the sermon. No one rose to leave the church; no one seemed to have observed anything strange. The morning service ended, and although it was the first time the surplice had been worn in the pulpit, nobody appeared conscious of any deviation from the usual custom. During the following week, I fully expected to hear some mutterings of a gathering storm. I called upon my friend, found him very affable, but all unconscious of my backsliding. We chatted about the Sunday morning service. He was pleased to express his high satisfaction with the sermon. I asked him if he had observed anything strange in my manner. No; he had not observed anything different.

'Why,' said I, 'last Sunday morning I preached in my surplice.'

'Preached in your surplice!' he screamed out. 'Impossible!'

I explained matters; and he was too sensible a man and too good a Christian to say anything more about the matter. It reminded me of the well-known answer of the Cambridge Professor, who having married, continued, in defiance of the statute, to hold his fellowship for fourteen years, who when asked how he could possibly have done such a thing, replied sagely: 'You can hold anything if you can hold your tongue.'

The last fix I was in was the following. One day, when seated near the stern of a Thames steamboat, I was aroused by a loud cry from the forward part of the boat and a rushing of the passengers to one side. I rose from my seat, and turning to the man at the wheel, asked him what was the matter. With his eyes fixed on something in the water, he replied: 'Please, sir, hold this a minute!'

I mounted the step, and had scarcely taken hold of the wheel, when the man leaped upon

the bulwark and sprang overboard. The cause of all this commotion then appeared. A man who had taken his wife and children out upon the Thames in a boat, had endeavoured to attach his skiff to a passing tug ahead of us, and, incautiously holding to the tow-rope, had been jerked into the water, where he was now drowning before our eyes. The helmsman of our boat had jumped over, in the hope of rescuing him. I caught a glimpse of the drowning man battling for life, and heard the screams of his wife and children above all the shouting and turmoil. But what of myself? The steamboat was crowded; the river was at swift ebb and full of vessels; and I, entirely ignorant of steering, was responsible for the safety of hundreds. However, I recalled as much as possible my boat-lore of early days, and headed the vessel to the centre of one of the arches of a bridge, towards which we were rapidly drifting. I remember the sense of relief with which I heard the captain shout 'Stop her!' and for some minutes the vessel was poised against the current in the middle of the river, while I held on to the wheel. The drowning man was never recovered; and we took on board of our steamboat his wife and children, in a condition of terror and bewildered grief which may readily be imagined. But never did I more readily escape from any of my fixes than when a new steersman came aft and assumed the charge of the wheel. It was a curious position for a clergyman to find himself suddenly steering a Thames steamboat, but 'One man in his time plays many parts.'

SPRING IS COMING.

I.

'SPRING is coming! Oh, Spring is coming!'

A whisper is flying all down the wood;
Primrose and daffodil softly calling,
Calling each dainty leaflet and bud!
Through the hedgerow, and by the coppice,
Far and wide over mead and hill,
A breath of life is secretly stealing
Among the trees, at its own sweet will.
Under the moss on the giant beeches,
Down to the carpet of leaves below,
Where the ant and the beetle as yet are sleeping,
And the dormouse hides from the wintry snow;
They know full well the voice that is calling,
And, all along by the ferny brake,
Where'er there is life the whisper is flying,
'Oh, Spring is coming! Awake, awake!'

II.

High up in the elm the rooks are busy,
As if icy Winter had really fled;
The finches and starlings are preening their feathers,
And the robin's breast is growing more red.
They hear the whisper, and sing to the South Wind
The sweetest song that a bird can sing:
'Oh, the season of sunshine and love is coming,
The bonnie days of the bonnie Spring.'

BOOK-LOVERS IN THE MONASTIC AGE.

EXTREME antiquity gives birth to a certain feeling of divinity, which finds a home in the most callous breast. Pacing slowly through an old village church, the mind instinctively turns back through long ages to the beginning of the Christian era. Wandering into the musty, worm-eaten pews, and opening the old tattered Bibles, one yields to the irresistible fascination of looking at their dates, and reading their homely inscriptions and entries of births, deaths, and marriages. The mind thoughtfully ponders on the old inscriptions which 'the rude forefathers of the hamlet' have handed down to posterity; and loses itself in vague wonderings, as it notes the iron clamp by which the Book of Life was chained in bygone days to the massive Gothic pillar. The congregation who listened with rapt attention to the sacred words are now sleeping peacefully under the heaving turf outside. Some of the stones, worn, gray, and crumbling, dip over the grassy graves. The butterflies flit overhead, and the swallows still return in summer; only the human beings are changed and gone. Are there any persons who can hold the crackling parchments of monastic days in their hands without feeling an intense interest in the solemn scribes who penned those ancient folios? Are there any human beings who cannot revel in a library rich in ancient literature and relics of the past? Who can look unmoved upon a newly discovered coin that was current when immortal Socrates was propounding his doctrines to the people of Greece?

The passion for book-hunting flourished as far back as the dark ages of cobwebbed parchments and musty records—when the Anglo-Saxon minstrel seeking a night's shelter within the quiet cloisters, sung to the cowed monks, when their day's work was done, of their dead heroes and their glorious lives, and roused their quiet hearts to enthusiasm with his lays of ancient conquerors and their noble deeds. No true book-lover but looks back with intense gratitude and interest to the cloistered bibliophiles, who were so enthu-

siastic in their book-collecting—the time and infinite labour they bestowed on a single manuscript; the exquisite illuminations with which they decorated their work; the mathematical precision of their even lines, and well-formed perpendicular letters.

A manuscript of the eighth century lies before us. The binding is gorgeous with gold and silver and precious stones. The 'feel' of the book seems to answer to the Greek word *hieros* (sacred)—to spiritualise and waft one back to the quiet calm of the Benedictine monastery, before the Danes bore down upon it with fire and bloodshed. Let us push open the heavy oaken door, studded with huge nails, and glance in upon the grave-browed old Saxon who sits in his cell, or *scriptorium*, transcribing busily. The apartment is utterly bare, having only a hard straight-backed chair and wooden table. The floor is uncarpeted, the walls are cold stone, not a picture to grace the chilly bareness of the arched apartment. Yet the use of the cell was deemed a great honour, and was granted only to those who were distinguished for piety and learning. Here the old cowed Saxon scribe labours, and the summer air comes in through the open window upon his shaven crown. A gorgeous sunset flames in the west, and glows upon the rich monastic lands stretching away to the horizon. There are no sounds of human life; but the painted butterflies flit dreamily past, and the birds hop in and out of the casement with a fearlessness which betokens the bond betwixt the old scribe and nature. He labours on till the stars come out and night veils the scene; then he goes to his midnight prayers in the silent cloisters. Time passes dreamily on, with the even tenor of strict monastic life, yet sweetened by the silent companionship of books. Year after year the cloistered bibliophile labours; through the intense cold of winter, when he freezes in his cell, and his numbed fingers can scarcely guide the *stilus* to form the Old English perpendicular strokes on the cold parchment stretched before him. But the uniformity of the caligraphy is maintained throughout. The

large capital letters remain to this day brilliant with illuminations of pure gold, crimson, and purple. The designs are chaste; the delicate manipulation of the colouring, the double-columned folio pages, and the richly illuminated pictures of the saints, are exquisite.

It is intense pleasure to look upon and touch with our fingers so wonderful a work of art—one of the earliest attempts to transcribe the Scriptures into the vulgar tongue; to be carried back to the earliest ages of the Christian era, when the quiet abbeys sheltered bibliomaniacs of no small pretensions, and ecclesiastical illuminators who were adepts at their intricate art. It is vain to try to describe the beauties of those works of art which have been handed down to us, each page of the missal an embroidery of gorgeous colouring, the sacred names transcribed in gold, the exquisite patterns executed in the *scriptorium* of some ancient and now ruined abbey.

One of the curiosities of early days is the floral directory, which assigns to each flower a particular saint and day on which to bloom. Thus, the sunflower is dedicated to St Barnabas, and the immaculate lily to the Virgin; deadly monkshood belongs to St Dunstan, and the sensitive plant to St Vitus; whilst the gaudy rhododendron is appropriated by St Augustine. We can imagine the early Egyptian going by his rice-fields, bowing down before the stately lotus, which rose out of the water at the dawn, and sunk again at sunset. There was also a clock of flowers. And many were the deadly poisons and marvellous cures distilled from the herbs and flowers blossoming around the monastery walls.

To possess a library was the first great aim of monastic life. Not only books upon ecclesiastical subjects—not only lives of saints and martyrs, and homilies, but such standard works as Plato, Virgil, Ovid, Juvenal, Horace, and Æsop adorned their shelves, showing how rapidly they covered vellum. Indeed, for classic learning the monks of old stand out pre-eminently. Their libraries were under the care of the 'armarian,' and it was his duty to catalogue all the works under his charge and keep them carefully preserved. Their mode of cataloguing was different from ours; they aimed more at identifying a book than describing its contents. Many armarians noted down the last few words on the second-last page, which had the advantage that the reader could more easily find out if the work was complete.

Every book-lover feels a twinge of agony when he is asked for the loan of a favourite volume. If he refuses, he feels selfish in not sharing his joys with another. If he acquiesces, he knows no rest till again he feels his treasure within his grasp. The borrowers of old, like the borrowers of to-day, sometimes forgot to return that which was lent. But the ancients had the sense to guard against want of memory and punctuality. When a neighbouring monastery borrowed a book, it had to deposit as security a sum above its value, and there was a bond in writing promising to return the work within a certain period. An obscure or doubtful borrower had to deposit a work of equal value before he could even glance inside the coveted tome. This very care goes more to show the monastic love of learning and books than anything else. The armarian also superintended

the scribes, made the ink, cut the vellum, and hired those who were employed as transcribers. Two kinds of apartments or *scriptoria* were used for writing. The *scriptorium* used for general literary work was a huge bare hall, filled with rows of straight-backed seats, where the scribes sat. One monk, well acquainted with the subject in hand, read aloud, and all copied from him simultaneously. There were also small cells, where the most learned monks were permitted to study in solitude. We have undoubtedly great readers to-day, but under what different circumstances of ease and luxury do we pursue our studies! It is difficult to realise the life of Petrarch, who, besides being Italy's most glorious lyric poet, was also a great bookworm and collector. He never travelled without horses loaded with books, and accompanied by many scribes. His love of reading was so great that, he tells us, whether he rode or walked, had his hair cut or took his meals, his beloved book was always open before him. When he felt death coming on, he presented his treasures, his books, rare and ancient manuscripts, to the city of Venice, from which magnificent collection sprung the library of St Mark. Petrarch loved to share his learning with others: he lent his books freely; and through this good nature, we have to deplore the irreparable loss of Cicero's *De Gloria*, which was pawned by the old man to whom the poet had lent the manuscript.

At the same period, whilst Edward III. was on the English throne, that wonderful bibliophile, Richard de Bury, was forming his collection of vellum treasures. He was constantly employed in searching out the rare works his heart longed for. Not content with ransacking his own country, he went abroad, where he fell in with Petrarch. We can imagine how the two collectors compared notes and gloated over their books, and the hours they spent together amongst the treasures of Petrarch's library. Perchance the generosity of the great Italian sent De Bury away happy in the possession of some coveted tome, rich in wondrous calligraphy and gorgeous illuminations. De Bury's pen has left us *Philobiblon*, not so much admired for the purity of its Latin as for the enthusiastic tone which runs through it. So much for a book-hunter of five hundred years ago. Can we not picture him defying the icy winds of winter, as he lingered by the open stall—then the popular mode of selling books—fingering the musty tomes! He cared not whither or how far he went, so long as he found a book at his journey's end.

A few years previous to his death, there had been born, in an old manor-house in Yorkshire, a boy who was to light up his name with undying glory—John de Wyclif—who, living the life of a country parson, was yet building up day by day the first English version of the *whole* Bible.

A difference of opinion regarding ecclesiastical policy has done much to denude the monastic age of its well-deserved praise and gratitude. It is to them we owe our choicest and most beautiful manuscripts. To their love of books we owe our magnificent collections of valuable manuscripts which form the priceless treasures of the Vatican, the Cottonian and Bodleian libraries, and the British Museum. It is with a thrill of sorrow that the bibliophile remembers how many thou-

sands of manuscripts that escaped the lawless hands of the invading barbarians, met with a still more ignominious fate during later ecclesiastical contentions. Manuscripts of classic and ancient dates met with the same fate as those which dealt with the controversies of the day. There was no discrimination; and thus the bibliophile sighs over the wanton destruction of manuscripts of which it is impossible to estimate the loss. When the student wanders thoughtfully amongst the ruins of long ago, the 'long-drawn aisles and fretted vaults' are lit up by the holy light of a vanished past; he can see in fancy the sombre, cowed head of some monkish student gazing out upon the yellow corn through the delicate tracery of the pointed Gothic windows, now fast crumbling to decay. At night, through the arched and pillared cloisters, the moon throws long silvery streaks upon the broken stone pavements; and imagination sees the weird, hooded form of a long-robed monk glide silently across the broad triangle and vanish into the deep obscurity. The creeping lichens and drooping ivy obstruct the grand old gateway, and the chill stone walls have a green and mossy pattern traced upon their bareness. The *scriptorium* of the monks is now the home of the hooting owls and flittering bats; the air strikes to the bone, chill and icy and damp; but the book-lover gazes dreamily upon the ruins by the light and atmosphere of other days, and the feeling is a prayer.

THIS MORTAL COIL.

CHAPTER XIII.—WHAT SUCCESS?

At the Meyseys' next morning, all was turmoil and surprise. The servants' hall fluttered with unwonted excitement. No less an event than an elopement was suspected. Miss Elsie had not come down to breakfast; and when Miss Winifred went up, on the lady's-maid's report, to ask what was the matter, she had found the door securely locked on the inside, and received no answer to her repeated questions. The butler, hastily summoned to the rescue, broke open the lock; and Winifred entered, to find the lamp still feebly burning at half-height, and a huddled confusion everywhere pervading the disordered room. Clearly, some strange thing had occurred. Elsie's drawers had been opened and searched: the black bag was gone from the stand in the corner; and the little jewel-case with the silver shield on the top was missing from its accustomed place on the dressing-table. With a sudden cry, Winifred rushed forward, terrified. Her first idea was the usual feminine one of robbery and murder. Elsie was killed—killed by a burglar. But one glance at the bed dispelled that illusion; it had never been slept in. The nightdress and the little embroidered nightdress bag in red silk were neither of them there in their familiar fashion. The brush and comb had disappeared from the base of the looking-glass. The hairpins even had been removed from the glass hairpin box. These indications seemed frankly inconsistent with the theory of mere intrusive burglary. The enterprising burglar doesn't make up the beds of the robbed and murdered, after pocketing their watches; nor does he walk off, as a rule, with ordinary hairbrushes and embroidered nightdress

bags. Surprised and alarmed, Winifred rushed to the window: it was open still: a branch of the wistaria lay broken on the ground, and the mark of a falling body might be easily observed among the plants and soil in the shrubbery border.

By this time, the Squire had appeared upon the scene, bringing in his hand a letter for Winifred. With the cool common-sense of advancing years, he surveyed the room in its littered condition, and gazed over his daughter's shoulder as she read the shadowy and incoherent jumble of phrases Hugh Massinger had strung together so carefully in Elsie's name last night at the *Fisherman's Rest*. 'Whew!' he whistled to himself in sharp surprise as the state of the case dawned slowly upon him. 'Depend upon it, there's a young man at the bottom of this. "*Cherchez la femme*," says the French proverb. When a young woman's in question, "*Cherchez l'homme*" comes very much nearer it. The girl's run off with *somebody*, you may be sure. I only hope she's run off all straight and above-board, and not gone away with a groom or a gamekeeper or a married clergyman.'

'Papa!' Winifred cried, laying down the letter in haste and bursting into tears, 'do you think Mr Massinger can have anything to do with it?'

The Squire had been duly apprised last night by Mrs Meysey—in successive instalments—as to the state of relations between Hugh and Winifred; but his blunt English nature cavalierly rejected the suggested explanation of Elsie's departure, and he brushed it aside at once after the fashion of his kind with an easy 'Bless my soul! no, child. The girl's run off with some fool somewhere. It's always fools who run off with women. Do you think a man would be idiot enough to—he was just going to say, 'propose to one woman in the morning, and elope with another the evening after?' but he checked himself in time, before the faces of the servants, and finished his sentence lamely by saying instead, 'commit himself so with a girl of that sort?'

'That wasn't what I meant, papa,' Winifred whispered low. 'I meant, could she have fancied?— You understand me.'

The Squire gave a snort in place of *No*. Impossible, impossible; the young man was so well connected. She could never have thought he meant to make up to *her*. Much more likely, if it came to that, the girl would run away *with* him than *from* him. Young women don't really run away from a man because their hearts are broken. They go up to their own bedrooms instead, and muse and mope over it, and cry their eyes red.

And indeed, the Squire remarked to himself inwardly on the other hand, that if Hugh were minded to elope with any one, he would be far more likely to elope with the heiress of Whitestrand than with a penniless governess like Elsie Challoner. Elopement implies parental opposition. Why the deuce should a man take the trouble to run away with an undowered orphan, whom nobody on earth desires to prevent him from marrying any day, in the strictly correctest manner, by banns or license at the parish church of her own domicile? The suggestion was clearly quite quixotic. If Elsie had run away with any one, it was neither from nor with this young man of Winifred's, the Squire felt sure, but with the gardener's son or with the under-gamekeeper.

Still, he felt distinctly relieved in his own mind when, at half-past ten, Hugh Massinger strolled idly in, a rose in his button-hole and a smile on his face—though a little lame of the left leg—all unconscious, apparently, that anything out of the common had happened since last night at the great house.

Hugh was one of the very finest and most finished actors then performing on the stage of social England; but even he had a difficult part to play that stormy morning, and he went through his rôle, taking it altogether, with but indifferent success, though with sufficient candour to float him through unsuspected somehow. The circumstances, indeed, were terribly against him. When he fell the night before from Elsie's window, he had bruised and shaken himself, already fatigued as he was by his desperate swim and his long unconsciousness; and it was with a violent effort, goaded on by the sense of absolute necessity alone, that he picked himself up, black bag and all, and staggered home, with one ankle strained, to his rooms at the Stannaways'. Once arrived there, after that night of terrors and manifold adventures, he locked away Elsie's belongings cautiously in a back cupboard—incriminating evidence, indeed, if anything should ever happen to come out—and flung himself half undressed at last in a fever of fatigue upon the bed in the corner.

Strange to say, he slept—slept soundly. Worn out with overwork and exertion and faintness, he slept on peacefully like a tired child, till at nine o'clock Mrs Stannaway rapped hard at the door to rouse him. Then he woke with a start from a heavy sleep, his head aching, but drowsy still, and with feverish pains in all his limbs from his desperate swim and his long immersion. He was quite unfit to get up and dress; but he rose for all that, as if all was well, and even pretended to eat some breakfast, though a cup of tea was the only thing he could really gulp down his parched throat in his horror and excitement. Last night's events came clearly home to him now in their naked ghastliness, and with sinking heart and throbbing head he realised the full extent of his guilt and his danger, the depth of his remorse, and the profundity of his folly.

Elsie was gone—that was his first thought. There was no more an Elsie to reckon with in all this world. Her place was blank—how blank he could never before have truly realised. The whole world itself was blank too. What he loved best in it all was gone clean out of it.

Elsie, Elsie, poor drowned, lost Elsie! His heart ached as he thought to himself of Elsie, gasping and struggling in that cold, cold sea, among those fierce wild breakers, for one last breath—and knew it was he who had driven her, by his baseness and wickedness and cruelty, to that terrible end of a sweet young existence. He had darkened the sun in heaven for himself henceforth and for ever. He had sown the wind, and he should reap the whirlwind. He hated himself; he hated Winifred; he hated everybody and everything but Elsie. Poor martyred Elsie! Beautiful Elsie! His own sweet, exquisite, noble Elsie! He would have given the whole world at that moment to bring her back again. But the past was irrevocable, quite irrevocable. There was nothing for a strong man now to do but to brace himself up and face the present.

'If not, what resolution from despair?'—That was all the comfort his philosophy could give him.

Elsie's things were locked up in the cupboard. If suspicion lighted upon him in any way now, it was all up with him. Elsie's bag and jewel-case and clothing in the cupboard would alone be more than enough to hang him. Hang him! What did he care any longer for hanging? They might hang him and welcome, if they chose to try. For sixpence he would save them the trouble, and drown himself. He wanted to die. It was fate that prevented him. Why hadn't he drowned when he might, last night? An ugly proverb that, about the man who is born to be hanged, &c., &c. Some of these proverbs are downright rude—positively vulgar in the coarse simplicity and directness of their language.

He gulped down the tea with a terrible effort: it was scalding hot, and it burnt his mouth, but he scarcely noticed it. Then he pulled about the sole on his fork for a moment, to dirty the plate, and boning it roughly, gave the flesh to the cat, who ate it purring on the rug by the fireplace. He waited for a reasonable interval next before ringing the bell—it takes a lone man ten minutes to breakfast—but as soon as that necessary time had passed, he put on his hat, crushing it down on his head, and with fiery soul and bursting temples, strolled up, with the jauntiest air he could assume, to the Meyseys' after breakfast.

Winifred met him at the front door. His new sweetheart was pale and terrified, but not now crying. Hugh felt himself afraid to presume upon their novel relations and insist upon a kiss—she would expect it of him. It was the very first time he had ever kissed her, and, oh evil omen, it revolted him at last that he had now to do it—with Elsie's body tossed about that very moment by the cruel waves upon that angry bar or on the cold sea-bottom. It was treason to Elsie—to poor dead Elsie—that he should ever kiss any other woman. His kisses were hers, his heart was hers, for ever and ever. But what would you have? He looked on, as he had said, as if from above, at circumstances wafting his own character and his own actions hither and thither wherever they willed—and this was the pass to which they had now brought him. He must play out the game—play it out to the end, whatever it might cost him.

Winifred took the kiss mechanically and coldly, and handed him Elsie's letter—his own forged letter—without one word of preface or explanation. Hugh was glad she did so at the very first moment—it allowed him to relieve himself at once from the terrible strain of the affected gaiety he was keeping up just to save appearances. He couldn't have kept it up much longer. His countenance fell visibly as he read the note—or pretended to read it, for he had no need really to glance at its words—every word of them all now burnt into the very fibres and fabric of his being.

'Why, what does this mean, Miss Meysey—that is to say, Winifred?' He corrected himself hurriedly. 'Elsie isn't gone? She's here this morning as usual, surely?'

As he said it he almost hoped it might be true. He could hardly believe the horrible, horrible reality. His face was pale enough in all con-

science now—a little too pale, perhaps, for the letter alone to justify. Winifred, eyeing him close, saw at a glance that he was deeply moved.

'She's gone,' she said, not too tenderly either. 'She went away last night, taking her things with her—at least some of them.—Do you know where she's gone, Mr Massinger? Has she written to you, as she promises?'

'Not Mr Massinger,' Hugh corrected gravely, with a livid white face, yet affecting jauntiness. 'It was agreed yesterday it should be "Hugh" in future.—No; I don't at all know where she is, Winifred; I wish I did.' He said it seriously. 'She hasn't written a single line to me.'

Hugh's answer had the very ring of truth in it—for indeed it was true; and Winifred, watching him with a woman's closeness, felt certain in her own mind that in this at least he was not deceiving her. But he certainly grew unnecessarily pale. Cousinly affection would hardly account for so much disturbance of the vaso-motor system. She questioned him closely as to all that had passed or might have passed between them these weeks or earlier. Did he know anything of Elsie's movements or feelings? Hugh, holding the letter firmly in one hand, and playing with the key of that incriminating cupboard, in his waistcoat pocket, loosely with the other, passed with credit his examination. He had never, he said, with gay flippancy almost, been really intimate with Elsie, talked confidences with Elsie, or received any from Elsie in return. She did not know of his engagement to Winifred. Yet he feared, whatever her course might be, some man or other must be its leading motive. Perhaps—but this with the utmost hesitation—Warren Relf and she might have struck up a love affair.

He felt, of course, it was a serious ordeal. Apart from the profounder background of possible consequences—the obvious charge of having got rid of Elsie—two other unpleasant notions stared him full in the face. The first was, that the Meyseys might suspect him of having driven Elsie to run away by his proposal to Winifred. But supposing even they never thought of that—which was highly unlikely, considering the close sequence of the two events and the evident drift of Winifred's questions—there still remained the second unpleasantness—that his cousin, through whom alone he had been introduced to the family, should have disappeared under such mysterious circumstances. Was it likely they would wish their daughter to marry a man among whose relations such odd and unaccountable things were likely to happen?

For, strangely enough, Hugh still wished to marry Winifred. Though he loathed her in his heart just then for not being Elsie, and even, by some illogical twist of thought, for having been the unconscious cause of Elsie's misfortunes; though he would have died himself far rather than lived without Elsie; yet, if he lived, he wished for all that to marry Winifred. For one thing, it was the programme; and because it was the programme, he wanted, with his strict business habits, to carry it out to the bitter end. For another thing, his future all depended upon it; and though he didn't care a straw at present for his future, he went on acting, by the pure force

of habit in a prudent man, as deliberately and cautiously as if he had still the same serious stake in existence as ever. He wasn't going to chuck up everything all at once, just because life was now an utter blank to him. He would go on as usual in the regular groove, and pretend to the world he was still every bit as interested and engaged in life as formerly.

So he brazened things out with the Meyseys somehow, and to his immense astonishment, he soon discovered they were ready dupes, in no way set against him by this untoward accident. On the contrary, instead of finding, as he had expected, that they considered this delinquency on the part of his cousin told against himself as a remote partner of her original sin, by right of heredity, he found the Squire and Mrs Meysey nervously anxious for their part lest he, her nearest male relative, should suspect them of having inefficiently guarded his cousin's youth, inexperience, and innocence. They were all apology, where he had looked for coldness; they were all on the defensive, where he had expected to see them vigorously carrying the war into Africa. One thing, above all others, he noted with profound satisfaction—nobody seemed to doubt for one second the genuineness and authenticity of the forged letter. Whatever else they doubted, the letter was safe. They all took it fully for granted that Elsie had gone, of her own free-will, gone to the four winds, with no trace left of her; and that Hugh, in the perfect innocence of his heart, knew no more than they themselves about it.

Nothing else, of course, was talked of at Whitestrand that livelong day; and before night, the gossips and quidnuncs of the village inn and the servants' hall had a complete theory of their own to account for the episode. Their theory was simple, romantic, and improbable. It had the dearly-loved spice of mystery about it. The coastguard had noticed that a ship, name unknown, with a red light at the masthead and a green on the port bow, had put in hastily about nine o'clock the night before, near the big poplar. The Whitestrand cronies had magnified this fact before nightfall, through various additions of more or less fanciful observers or non-observers—for fiction, too, counts for something—into a consistent story of a most orthodox elopement. Miss Elsie had let herself down by a twisted sheet out of her own window, to escape observation—some said a rope, but the majority voted for the twisted sheet, as more strictly in accordance with established precedent—she had slipped away to the big tree, where a gentleman's yacht, from parts unknown, had put in cautiously before a terrible gale, by previous arrangement, and had carried her over through a roaring sea across to the opposite coast of Flanders. Detail after detail grew apace; and before long there were some who even admitted to having actually seen a foreign-looking gentleman in a dark cloak—the cloak is a valuable romantic property upon such occasions—catch a white-robed lady in his stout arms as she leaped a wild leap into an open boat from the spray-covered platform of the gnarled poplar roots. Hugh smiled a grim and hideous smile of polite incredulity as he listened to these final imaginative embellishments of the popular fancy; but he accepted in outline the romantic tale as

the best possible version of Elsie's disappearance for public acceptance. It kept the police at least from poking their noses too deep into this family affair, and it freed him from any possible tinge of blame in the eyes of the Meyseys. Nobody can be found fault with for somebody else's elopement. Two points at least seemed fairly certain to the Whitestrand intelligence: first, that Miss Elsie had run away of her own accord, in the absence of the family; and second, that she neither went by road nor rail, so that only the sea or river appeared to be left by way of a possible explanation.

The Meyseys, of course, were less credulous as to detail; but even the Meyseys suspected nothing serious in the matter. That Elsie had gone was all they knew; why she went, was a profound mystery to them.

SOME STAGE-TRADES.

BY AN OLD STAGER.

AN article bearing the above title appeared in the *Journal* for January 31, 1885. A reference to the article in question will remind our readers that such accessories as wigs, costumes, hosiery, &c., contribute not a little to the dramatic effect of modern plays. There are many other trade items, however, such as picture-posters, electric light, stage-furniture, foil-paper, jewelry, and limelight, which often help, directly or indirectly, to enhance the success of a good play or gloss over the imperfections of a bad one. Let us examine one or two of these aids to theatrical prosperity.

Picture-printing—which of course includes the production of 'posters'—is, *par excellence*, the industry which gives the initial push to any theatrical venture, be the constituents of that venture good or bad. While many people have neither patience nor time to con over a startling advertisement in the newspaper, or to wade through columns of 'press opinions,' few can resist a passing glance at the red, blue, and yellow pictures which stare from every available hoarding, and portray with pardonable exaggeration the climax of virtue's triumph and the hand-cuffed termination of long successful vice. Who, for instance, could withstand the *Lights o' London* caravan-scene in eight double-crown coloured sheets? Who could banish all the superstition inherent in the human mind when an adjacent street lamp lights up with fitful weirdness the trap-scene in the *Corsican Brothers*? Who would not sympathise with the agonised, upturned face of the 'Silver King,' clench hands at the diabolical Jacques in the garret-scene of the *Two Orphans*, weep with poor 'Jo,' or smile with the curate whose appearance in the *Private Secretary* is so naturally realised by the lithographer or zincographer? Newspaper advertisements may be all very well for the supply of necessary details; but for 'drawing' purposes, 'double crown' is undoubtedly the backbone of any play. The same remark applies to posters. Any agent in advance will tell you how necessary it is for posters to be of that attractive description which, whether we like it or not, compels our attention.

Comparatively enormous sums are spent on this theatrical adjunct alone; and few touring companies would have much chance of success were not their advent in each town set forth in glaring letters of Gargantuan dimensions. The printing of posters has been greatly facilitated by machinery. It is not such a very long time since poster-work was done entirely by hand, and even now the colouring is to some extent dependent on handwork, while hand-wrought 'streamers' can still be supplied—unless large quantities are required—at a less expense than machine-printed letters. Machines, however, have been introduced which are capable of printing eight or ten colours by one process; while one eminent firm has patented an invention for 'taking off,' and thus saving the labour of the boys who were formerly employed for that purpose. The patent, it is understood, pays its cost in boys' wages in a little over a year, so that after that period the work accomplished by it is so much profit to the proprietor.

Lithography and zincography are the processes which form the basis of our street picture-galleries. The process known as lithography is so generally understood that it is unnecessary to detain the reader with a description of it. Zincography, however, is perhaps not so well known; and as this process has now greatly superseded lithography in theatrical work, a few words of explanation may not be superfluous. In lithography, a stone is used, from which the impression is taken of whatever is intended to be printed. In zincography, a zinc plate takes the place of the lithographer's stone. This zinc plate having been 'grained' with fine sand, is ready for the design, which is drawn upon it with lithographic chalk and ordinary printer's ink. The design having been drawn, the plate is subjected to a solution of nut-galls, and when dry, is ready for supplying the necessary impression. Ordinarily, we believe, only the black colouring is printed by zincography, the remaining colours being filled up by hand. Zincography is a cheaper process than lithography, and though the printing of the former may not be so delicate as that of the latter, its cheapness—combined with the fact that a couple of thousand impressions may be had from one plate—has led it to supersede lithography in the printing of large posters, where delicate drawing is not so essential as a taking *tout ensemble*. In small work, such as music title-pages, lithography still holds its own; and in some of the larger lithographic establishments, thousands of these stones are kept in stock, many of them already prepared with the impression which may make or mar a good waltz or an indifferent ballad, for attractive frontispieces have sometimes not a little to do with the popularity of a piece of music. A good story in connection with these stones was told by a theatrical contemporary some time ago: 'On one occasion, a young enthusiastic composer was gazing with admiration upon the proof-print of his first published composition, and in order to admire it in detail and at his ease, he reclined gracefully against a bench which was immediately behind him. He was wearing at the time an elegant mouse-coloured overcoat; and when he rose from his recumbent attitude, the full impression of the title-page of another composer's waltz was plainly visible upon his garment.'

He had reclined against a "primed" stone which was waiting to be put on the machine, and had thus veritably obtained a proof before printing!

Turning from what may fairly be termed the advertising department of the theatre to an employment more immediately connected with the footlights, it will perhaps be interesting to note the valuable aids to stage-effect which the gasman's 'properties' afford. Ordinary gas, limelight, and electric light are helps which no well-organised theatre could afford to dispense with. To a modern audience, their beautiful effects are accepted as a matter of course; they have become used to them, and with use has been born indifference. Yet it would not be hard to picture the awe of a first-night pittance of the olden time who was satisfied with the printed intimation, 'This is a wood,' were he to come back to earth and visit the production of a spectacular piece of the present period. His astonishment on witnessing the ever-varying glows of colour which light up the transformation scene of a pantomime, would in all probability be more than his resurrected remains would be capable of supporting; while such less impressive items as the soft toning in the lighting of a cathedral 'exterior,' or the almost imperceptible change from stage-darkness to stage-dawn would in all likelihood impress the poor ghost with a very elevated opinion of the trade-side of theatrical progress. The limelight especially would give our friend what nurses call 'a turn.'

With regard to limelight, it may not be generally known that the neighbourhood of Nottingham supplies the greater part of the lime which is used for illuminative displays. After being carefully picked, the lime is turned in a lathe and made into little cylinders, each cylinder having a hole drilled lengthways to admit the holder of the jet apparatus. This cylinder-turning is not a healthy occupation to the workmen engaged in it; they are obliged to wear damp clothes over the mouth and nose, to prevent the inhalation of the lime-dust, such inhalation causing much irritation and well-nigh unbearable thirst. This is not the only danger attendant on limelight. Occasional explosions abundantly testify to the delicate handling which is necessary to the safe use of the prepared material; for, should the gases become mixed in either the tubes or bags, an explosion is the inevitable result. These occasional explosions, fortunately, are not always attended with fatal results, and the fact that they are only occasional speaks volumes for the careful attention of the almost unrecognised limelight-man.

With the systems of ordinary gas-lighting at the various theatres it is almost unnecessary to deal. Ordinary coal-gas is gradually becoming—a thing of the past. Though still used for lighting purposes in the footlights, battens, &c., its function in many theatres is now confined to simple illumination, and does not, in some of the best appointed theatres, extend to scenic effect. Indeed, it is to be hoped that for even illuminating purposes gas will soon be superseded by the electric light. Had electricity been the illuminant at the late Exeter theatre, it is possible that the terrible disaster there would never have

occurred. For scenic effect there is perhaps nothing that can vie with the electric light; and although, by means of coloured glasses, we can get from the limelight bag a gorgeous variety of colour, rivalling the rainbow in beauty, yet, for startling brilliancy, the electric light knows no superior. Perhaps the most striking illustration of the possibilities of electricity in stage-effect was to be seen a year or two ago at the Manchester Theatre Royal. This theatre had four electric machines, each of two hundred and fifteen sixteen-candle-power. During the pantomime, the current which supplied the two-hundred-lamp sunlight in the auditorium was not required in the transformation scene, and the happy idea of diverting the current from the sunlight to the stage was carried out. The result was that two hundred lamps, in groups of five, were brought into use on the transformation, each group forming a halo round the heads of the posing fairies, the principal fairy being a perfect blaze of electricity, and the remainder of the lamps being arranged to form two arches of light over the entire stage. The spectacle could not but have the effect of impressing the onlooker not only with its present magnificence, but with the possibilities of future greater stage-triumphs by means of electricity.

Leaving the more easily recognised stage-employments, let us turn to one or two minor crafts which may not be without interest. We use the word 'minor' as if speaking from the standpoint of the uninitiated spectator. Such trifles, for instance, as stage-jewelry, foil-paper, &c., are comparatively unnoticed amidst the more gorgeous surroundings of a spectacular scene; yet they are not unimportant to those whose business it is to prepare the innumerable details which go to form the eye-pleasing whole. Who in stalls, gallery, or pit would waste a moment's thought on such a trifling item as foil-paper? Yet, but a year or two ago, there was only one man in London—Mr Bosanquet, in the Barbican—who could manufacture foil-paper! And where would all our demon caves be without the glitter of that weird-looking manufacture? Of course, with a limited home manufacture, the demand by far exceeds the supply, and the Continent is consequently laid under contribution. Germany, in fact, is our principal foil-furnisher; and though even Germany cannot equal the quality of home-made foil, it goes without saying that the quantity supplied by Germany is far in excess of the outcome of London. Quality, however, goes for a good deal in foil-paper; and it will probably surprise the reader to know that were a sheet of metal-faced paper worth threepence and a sheet of gold-paper worth four shillings placed before him, he would in all probability be unable to distinguish any difference between them.

Spangles, again, are a seemingly unimportant trifle, yet they occupy a prominent position in the adornment of many stage-costumes. Here, again, our continental neighbours undersell us; for while spangles in England cost something like four shillings per pound, they can be made and sold on the Continent for about three shillings. A spangle in the rough is simply a thin piece of copper wire which is placed on an anvil and struck flat by a boxwood hammer. The little disc which, multiplied by thousands, and stitched on harlequin's dress, gives our mysterious Christ-

mas friend such a glittering appearance, is the result. But poor harlequin, like many actors on the world's stage, has to sacrifice comfort for appearances, as the thousands of spangles which adorn his costume make that costume heavier than an ordinary suit of clothes, and render his seemingly light-limbed movements anything but agreeable exercise to the performer.

Other unconsidered stage trifles may be studied in the manufacture of pearls for costume-pieces. Stage pearls consist of a thin glass globule into which the pearl-maker pours a preparation composed of the scales of dace; and a coating of wax being added, the imitation pearl is ready for use. Other costume ornaments, such as stars, &c., employ a great number of labourers, and require more skill than is generally imagined. Some time ago, we had an opportunity of inspecting the establishment of a stage-jeweller in London, and while there, found a workman engaged on the formation of a 'star.' A piece of pasteboard was cut out to the necessary shape, and was then fastened to a foundation of buckram. On this, a wire was stitched from the centre of the 'star' to the apex of each triangle, the wire being bordered with spangles, which effectually covered the pasteboard foundation. A raised satin centre-piece was then added, and the star was ready for its kingly, princely, or knightly wearer. Friendly Societies and kindred organisations in which stars and other embellishments are worn by members, are good customers to this particular trade, which furnishes 'heaps of pearl, inestimable stones, unvalued jewels' to those whose business or pleasure it is to display such decorations.

To the one subject of the supply of stage-furniture an article might easily be devoted, were it not that such a description would perforce entail a *résumé* of the commonest details of so-called 'cabinet-making.' In these days of realism, 'make-up' furniture has no opportunity. The audience expects, and must have, a real drawing-room or a real kitchen, and will not be satisfied with the imitations which did duty in former days. When it is known that a suite of stage furniture has cost two hundred and fifty pounds; that Miss Genevieve Ward uses little footstools at three pounds apiece; that a fireplace and over-mantel are not thought extraordinarily dear at fifty pounds; a pair of curtains at forty pounds; a small marquetric table at fifteen pounds; a centre carpet at seventy-five pounds, and a candelabrum and clock at forty pounds—it will be seen that the days of imitation furniture are gone. To begin now to tell of the 'property' devices of past days would be but a resuscitation of ancient history; while a description of the stage-furniture of the present day would be an unnecessary catalogue of the contents of any first-class furniture warehouse.

It will be seen, we hope, from the few out of many available facts we have enumerated, that many almost unthought-of adjuncts help to contribute to the enjoyment which most of us find at any well-organised theatre. Without their assistance, theatrical entertainments would lose half their charm; and though the critical amongst us may possibly be able to deduce instruction or entertainment from the acting alone, yet the major portion of the theatre-going public will possibly be open to the conviction that acting

itself, however artistic, would be comparatively unattractive if deprived of the assistance of the stage-trades referred to in this and a former article.

IN DANGER'S WAY: A TALE OF TWO HEROES.

CHAPTER III.—PURSUED.

It was close upon midnight, as Captain Satchell had predicted it would be, before Max Von Rouin sprang ashore at Shingle Point. Having made his boat secure, he walked straight inland along a rough, narrow road leading towards the town. There were few lights visible at this late hour, and of these, one only had an attraction for him. It was a dim light in a cottage that stood in an isolated spot by the roadside. Towards this cottage he eagerly turned his steps. When he reached the door, he hesitated for an instant with the latch half lifted; but in another moment he had stepped into a cosy room—half kitchen, half parlour. A matronly woman, whom he strongly resembled—the same kindly expression and dark eyes—welcomed him with a demonstrative greeting on both cheeks.

'Mother,' said he, sinking down wearily—for the sight of Stephen Walsh's swift yacht gliding out of the harbour at Southsea Bay had almost driven him to despair—'you must not think me unkind; but a matter—something of deep importance—forces me to leave you again in a few hours.'

The mother's face grew troubled. 'My son, it is time enough to talk of parting when the moment comes. Let me fancy for a while, whatever the truth may be, that you've got some days' leave of absence from the captain. For months past, dear Max—and it seems like years—I have been picturing you seated in your poor father's armchair, as I see you now, looking—But what is troubling my boy? He is more restless than ever! Some bad news—Why, can it be possible,' the woman suddenly exclaimed, 'that he has heard about the shipwreck?'

Max Von Rouin changed countenance. 'What shipwreck, mother?'

'Abel Honeywood's brig, the *Cora*.'

The young sailor started to his feet; the eager look came into his eyes. 'Mother, tell me all you've heard.'

'I merely know that news reached Shingle Point this evening—I know nothing more—news that a ship, supposed to be the *Cora*, was breaking up among the rocks off the Channel Islands.'

'What are the bearings? I must know at once the exact spot.'

'Shall I run over to the *Six Bells*? There is sure to be some one there who could tell me. There was a crowd talking about it on the beach this morning; but I didn't mind what they were saying; I could think of nothing but my boy.'

Von Rouin put on his cap and stepped towards the door. 'I will go, mother. I shan't be a minute.'

'But, Max, you must be famished,' urged the mother, 'and your soup has been simmering'—

Before she could finish, Max was gone.

With tears in her eyes—for the woman foresaw that at daybreak her son would leave her—she began to busy herself about his supper. An hour passed, and then Max Von Rouin came in flushed with excitement, his great dark eyes flashing hopefully. There was something grand expressed in the sailor's weather-beaten face; and the mother regarded him with a strange mixture of admiration and anxiety. He swallowed the plate of soup which she placed before him with an absent-minded air; and even when his mother spoke some endearing word, he made no answer. It was evident that his thoughts were far away from this homely cottage.

'It's a spring tide: to-morrow at midnight will be the time. The *Cora* lies wedged in between the rocks. She may go to pieces in the next storm—possibly before.—What time is it, mother?'

'Just gone two.'

'Three hours! I must start at five o'clock. It will be light enough then.'

'So soon? Dear Max, won't you stop one short day with your old mother?'

For a moment her son made no reply; he sat with a dreamy expression on his face. 'I will come back. I will stay with you then, mother, for days.—But first,' he added, with that look of energy returning, 'I must get possession of the diamond. When I have it—when I feel my heart beating hopefully against it, I shall know that she cannot, dare not say nay, when I ask her to be my wife.'

'Of what diamond are you speaking?'

'A most precious one. A diamond, mother, that's on board the *Cora*. It's in the captain's locker. The man must get it who would win *Cora* Norland's heart.' And he told his mother how he had found the scroll. 'And if I lose an hour,' he added, 'Stephen Walsh, who started from Southsea Bay a few hours after me, will be there first. He came into the *Six Bells* just as I was leaving; we looked at each other, but never spoke. He seemed almost to challenge me with his glance, and I let him see that I understood. An hour's talk could scarcely have made our meaning plainer to each other. He is thoroughly in earnest, and so am I.'

There was a moment's silence; then the mother, with her hand upon her son's arm, put the question: 'Do you really love this girl?'

'With all my heart.'

'But Max, my dear boy, what chance have you against a gentleman—a rich man like Mr Walsh?'

'None, I know, unless I find this diamond.'

'Would you risk your life for that?'

'A thousand times! Would not any man who loved as I love *Cora* Norland?'

The mother made no reply. She knew that any attempt to dissuade her son when his resolution was formed would be useless. After a little she said persuasively: 'Take some rest: you will need all your strength. Will you go and lie down in your room? I will wake you at daybreak.'

The young sailor, with no look of fatigue in his eyes, rose from his chair. 'I had almost forgotten,' said he laughingly, 'that there was such a thing as sleep.—How thoughtful you are, mother, of your troublesome son. He hardly

deserves it.' As he spoke, he stepped into an adjoining room—his room when a boy—threw himself down in his rough coat upon the bed, and in a short time he was fast asleep.

During the moments that her son rested, the mother never ceased to watch regretfully for the dawn; and if she could have persuaded herself that it was still night, when the first indications of morning streaked the eastern sky below dark clouds, she would have done so. With a weary sigh she went and awoke her son. There was an altered look on his face—a look almost of awe—when he came into the kitchen and sat down to the cup of coffee which his mother had prepared.

'I've had a strange dream,' said he. 'An angel dressed in white came across the sea with the diamond fixed above her forehead, and it shone like a brilliant star. But as I hurried along the shore towards it, a demon with the wings of a vampire plucked it off and carried it away. I was left in darkness, and the sound of great waves seemed to break upon my ear. I remember nothing more.'

The young sailor's superstitious mind was troubled by this dream; it appeared to forebode misfortune. He could not dismiss the thought from his excited brain that this venturesome expedition in search of the coveted diamond would end in disaster. But he was somewhat cheered, when the sail was unfurled and his boat was cutting through the waves and Shingle Point was growing small in the distance, to see no sign of Stephen Walsh's yacht; and besides—a fact not less encouraging—the wind could scarcely have been more favourable. He was sailing in a southeasterly direction—the direction he had been advised to take—and if the wind continued in the same quarter, the rocky coast for which he was bound might be reached before nightfall.

During the hour's absence from his mother's cottage in search of news at the *Six Bells*, Max Von Rouin had not been idle. Having ascertained the spot where the *Cora* was supposed to be lying—though possibly a complete wreck by this time among the rocks—he had provisioned his boat with a bag of biscuits and a flask of brandy; for although he had spoken as little as possible at the cottage concerning his scheme, he was absolutely resolved not to quit the scene of the wreck while a vestige of it held together—a vestige that might retain the diamond between its planks. He had also secured an oil lamp and some tools which might prove useful.

In the meantime, Stephen Walsh, whose animosity towards Max Von Rouin every moment increased, was scheming deeply. All through the night, up at the *Six Bells*, he paced his room, watching impatiently for a glimpse of morning. And while it was still dark night, and no sound reached him except the monotonous sound of the sea below his windows, he seemed like one haunted by some grim spectre that had gained a strong hold upon him. He sat staring vacantly with his hands pressed to his forehead; he seemed to be giving an attentive ear to evil promptings—promptings that brought a sickly pallor to his cheek and a guilty look to his eyes: 'Why not? It will be low water at midnight.' He was repeating words that seemed whispered to him: 'Why not? The tide will rise, and the waves

will wash out the stain.' And then he started up and peered out towards the horizon for a gleam of light.

The light came; but the look of dark purpose on the face of Stephen Walsh never changed. He stood at the window, watching Von Roûn as he put to sea; and the menacing air was again expressed in his whole attitude, and more markedly than on the previous night when he stopped with a threatening gesture upon the beach at Southsea Bay. He was now fully resolved to follow Von Roûn to the dangerous coast where the *Cora* was reported to be lying among the rocks, and thwart the young sailor in his bold intention to reach the wreck.

Stephen Walsh had cruised in these waters as much as any man, and he knew that the tide would be rising when Von Roûn reached the shore. He made no haste therefore to follow him; and glad he was that there was no need, for he did not wish it to be supposed, if he could avoid it, that he was yachting with any stronger motive than usual—mere pleasure.

'Returning to Southsea Bay, Mr Walsh?' the landlord of the *Six Bells* had asked him.

'Probably,' had been the cautious reply.

Nor did Stephen Walsh seem to have made up his mind when a mile or more off Shingle Point, for his yacht put about, first in one direction and then in another; and until out of sight of the coast he continued to exhibit this masterly indecision. But when once in the open sea, no doubt remained as to the course he intended to take; he crowded all sail, grasped the helm firmly, and steered steadily in a south-easterly direction, with his eyes now fixed upon a white sail that had become dimly visible on the horizon. The wind increased; and as the yacht leaped forward over the rough sea, Stephen Walsh's face again became clouded. His brow contracted; his thin lips were tightly compressed, and his whole manner showed the anger of the man. He seemed to gather rage from the crested, creeping waves around him. The spray that flew up at the prow and struck him frequently in the face, failed to remove the dark frown. His countenance never changed; his eyes never wandered from the white sail that remained seemingly motionless on the horizon against the blue sky.

Some hours passed, and the sun had begun to incline towards the west before the yacht came in sight of land, that rocky coast for which Stephen Walsh was bound—the coast near which it was believed that the *Cora* had sunk and was breaking up among the boulders. As Walsh had surmised, the tide was running in, and no sign of the shipwreck could be discerned. Max Von Roûn, as he could perceive, had already found his moorings in a sheltered creek some distance along the shore; and to all appearance, he was bent upon passing the night there in his boat.

Steering round the coast away from this creek, Walsh presently reached a small inlet or bay which formed a natural harbour. It was a favourite spot of his—one in which he frequently anchored when out on a yachting expedition. Here he dropped anchor. It was only characteristic of the man that he should have provisioned his boat sumptuously. He was accustomed to luxury on the sea as well as on land. He opened a well-stocked hamper, which the landlord of the

Six Bells had sent on board, and ate and drank with an appetite. Then he lit his pipe and stretched himself upon the 'upper deck' above his little cabin, and lay watching the red glow of sunset across the sea with drowsy eyes. It was high tide, and the rocky coast was white with the foam of broken waves. When he had been lying there an hour or more, a sense of fatigue overcame him. He crept into his cabin—for there was no room to stand upright in it—and sank upon the cushions. He was soon fast asleep.

Stephen Walsh awoke suddenly, after a long rest, fancying that some one had whispered in his ear. Was it the spirit of Abel Honywood? This was his first thought; but it made him laugh. The moonlight was looking in upon him through the little porthole on the starboard side; and he glanced eagerly seaward across the uneven coast; but he saw no one; and the only whispering that reached him was the distant sound of the waves breaking along the shore. The tide had gone out, and great boulders glistened in the bright moonlight with briny seaweed. Suddenly the figure of a man appeared, barefooted, moving rapidly from rock to rock and approaching the line of breakers. In an instant Walsh was out of his cabin and sliding down into the water without a sound. It was little more than knee-deep where his yacht was moored, for the tide was now almost at its lowest ebb. He waded silently across the inlet and walked along the beach. At one moment in the full moonlight, a moment after hidden by some huge rock, Stephen Walsh followed the figure stealthily towards the sea.

A CURIOUS NEW INDUSTRY.

It has now passed into a commonplace, that whoever can make two blades of grass grow upon a spot of ground where only one grew before, deserves well of mankind. Still more has that man a claim upon the regard of his fellows who can point out how, by using up a waste product, a new form of industry can be established.

We have such a new industry to chronicle in the present paper—an industry which is quite unique in more than one way. In the first place, its raw material can be found everywhere in illimitable quantity; while it costs nothing, and will convey itself free of expense to the place where it is dealt with. Can any other industry or manufacture be started on such advantageous terms as these? What would the Manchester merchant think of his cotton obtained and packed in his mills free of cost ready for operation? Why, such a thing would be beyond his wildest dreams. Another curious point in the new industry is, that the raw material, universal as it is—and of great bulk withal—is perfectly invisible. But in case our readers should think that we are propounding some elaborate riddle or charade by which to test their powers of unravelling a tangled skein, let us say at once that this new industry resolves itself into a

method of obtaining pure oxygen from the atmosphere.

In a recent paper ('Oxygen Starvation,' No. 209) we dealt with this gas, and pointed out how important it was to the human family. In the present article we intend to regard it more from a commercial aspect, and to show to how many uses it can be put. Any manual of chemistry will inform us that oxygen is the most widely diffused element in nature. It enters into the composition of air, of water; it is found in nearly all earths and rocks; and forms more than one-half of animal and plant life. In fact it is not too much to say that oxygen forms one-half of the globe and its belongings; but of course it is combined with other elements. Chemists can tell us of a dozen different methods of isolating this gas; but the one most usually adopted is to subject a salt of potash (potassic chlorate), which is extremely rich in oxygen, to heat in a retort, when it quickly parts with that gas, which can be collected in a suitable containing-vessel for use. To show the extent to which this salt is used for the production of oxygen, we may mention that we were lately informed by a London dealer that he sold yearly one hundred tons of potassic chlorate, and that he had reason to believe that it was nearly all used for the production of gas. This quantity of the salt would afford, roughly speaking, nine hundred thousand cubic feet of oxygen, and we must not forget that this is the amount dispensed through one dealer only. The natural question which arises as to what purposes all this gas is applied, we shall deal with presently. We have preferred to show, first, that there is an enormous demand for oxygen, so that the importance of a new industry for producing it may be at once appreciated.

Oxygen forms one-fifth of the air which we breathe, the other four-fifths consisting of an inert gas called nitrogen. And it is important that we should remember that the mixture of these two gases is a strictly mechanical, not a chemical one. What we mean is this. If it were possible by any means to make visible and magnify the particles of air, we should be able to distinguish the atoms of oxygen and of nitrogen side by side, but in the proportion of one to four. It might be compared to a mixture of pepper and salt, which, although it looks gray to the unaided sight, would, under the microscope, show plainly the independent grains of both constituents. (It is curious to note that a *chemical* mixture of the same two gases, in which their atoms combine to form a new compound, produces that useful anæsthetic, nitrous oxide—laughing-gas.) It has long been the dream of chemists that oxygen might be produced direct from the atmosphere by separating its atoms from the atoms of nitrogen with which it is associated but not combined. Indeed, a plan by which this could be accomplished has long been known, but it happens to be one of those numerous methods which in theory are perfect, but which when reduced to practice are found to be encumbered by various difficulties. But as our new industry is founded upon the process referred to, and its success has been assured by a patient conquest of the numerous practical difficulties associated with it, we cannot do better than describe it.

It was long ago demonstrated by Boussingault

that when the substance called baryta, otherwise the oxide of barium, was heated to a low redness it would absorb oxygen from air submitted to it. He further showed that if this compound were then raised to a higher temperature, the oxygen thus absorbed would be given off once more, and the baryta would be restored to its former condition, ready for a repetition of the action. It would thus seem that there was at hand a process for obtaining from the atmosphere an endless supply of its essence, so to speak. But, as we have before hinted, theory and practice are two different things. The process would not work on a commercial scale. All went well at first; but for some reason or other, the baryta lost its power of recovery, and would not repeat its office of absorbing oxygen.

A few years ago, two of M. Boussingault's pupils, Messrs A. and L. Brin, resolved to carry through a series of experiments to find out, if possible, why in this case practice would not endorse theory. They soon found that the reason why the baryta lost its power of absorbing oxygen was due to certain molecular changes, which ceased to occur if the air supplied was absolutely free from impurities, and if the heat employed for reducing the baryta to its first condition were kept within certain limits. They further found that the necessary temperature might be much reduced if the material were heated in a partial vacuum. Another advantage was found in supplying the air under pressure, in which case the absorption of oxygen from it was much increased. These new conditions were speedily realised in apparatus which was erected in Paris, and which for three years yielded oxygen of the purest description, without any renewal of the baryta with which the retorts were charged at the commencement of operations; and this apparatus was exhibited at the Inventions Exhibition at South Kensington two years ago.

The process having been thus shown to be workable, the inevitable Company was formed; and oxygen can now be obtained in any quantity at a cheap rate by any one who requires it. Brin's Oxygen Company has established extensive works at Westminster, where, by a system of retorts and air-pumps, the business of abstracting oxygen from the air is continuously carried on. The gas is carried to a holder, in which it is stored; and is drawn from that holder and compressed in steel cylinders for the use of the Company's customers. These cylinders are so strong, that one having a capacity of little more than a cubic foot of gas will hold forty feet when that gas is compressed within it. These bottles, placed in wooden cases, are now sent over the kingdom by rail and carrier.

Let us now endeavour to point out to what uses this endless supply of oxygen is, and is likely, to be put. We may give the first place to the oxyhydrogen or limelight, which is so extensively used over the country for exhibition purposes—a light so intense and beautiful that it is frequently confounded with that given by the electric arc. It is used largely in all theatres for the purpose of scenic effect, and is the common illuminant for the optical, or, to call it by its old name, the magic-lantern. The use of this lantern for educational purposes is constantly increasing, and few schools of any standing are unfamiliar

with its occasional use. The limelight is produced by a jet of oxygen combined with a jet of hydrogen, rendering white-hot a piece of lime. When some more refractory substance than lime can be discovered, a substance which will resist the intense heat of the combined gases, the limelight will be possible of great extension. Under such circumstances it would speedily come into use for the lighting of public buildings, if not ordinary dwelling-houses. To the worker in metals, a ready supply of oxygen is especially valuable, for the oxyhydrogen blowpipe flame is of such intensity that even platinum will melt in its fervent heat. There are many other processes connected with the arts and sciences where oxygen, readily available, instead of having to be prepared by a tiresome and somewhat dangerous operation, will be welcomed as a great boon; and more especially will this be the case when it is known that the oxygen so obtainable is absolutely pure. In making it from the potash salt already mentioned, the gas was always contaminated with a certain proportion of chlorine, an adulteration difficult to obviate without still further complicating the apparatus used in its production. And this question of purity of the gas produced by the new method leads us naturally to the subject of its application to medicine.

Every worker in a densely populated town or city knows the benefit that is likely to accrue to him if he can only contrive to get a few days' change of air. This change of air means the exchange of a foul atmosphere for one containing the proportion of oxygen which nature has determined as being the best for our respiration. It is not difficult to understand, therefore, the doctrine which many medical men are now advocating which gives oxygen a foremost place as a remedial agent. Is this doctrine anything new? one may naturally ask. Perhaps not; but for the first time the doctor has at hand a ready means of obtaining this antidote to disease. Siphon bottles charged with oxygen—instead of with carbonic acid, as in the case of ordinary aerated waters—are now supplied for the use of patients, and we are told on high authority that sufferers from dyspepsia, gout, rheumatism, &c., benefit greatly by their use. Other sufferers from chest diseases, such as consumption, chronic bronchitis, &c., benefit more, as we might naturally suppose, from the direct inhalation of the gas, diluted with more or less common air.

One more application of this pure oxygen let us refer to. It is well known that many epidemic diseases have been traced to a contaminated milk supply; a danger so generally appreciated by careful people, that it is a common rule in households to boil all the milk received before it is brought to table. It is found that if milk be oxygenated with pure gas, the germs of disease, if present, are at once destroyed, and the richness of the milk is developed and its taste improved. Milk thus treated with oxygen will last fresh for a fortnight or more, for all putrefactive changes are arrested. Brin's Oxygen Company have, with these facts in view, arranged a system by which milk can be charged with oxygen in the country as it is yielded fresh from the cow, and before it passes through the ordeal of a journey to town. The benefits of such a system to invalids and

weakly children cannot be overestimated. In concluding this notice of an interesting and, we venture to say, important new industry, it is impossible not to wish success to the undertaking.

AN OLD SHIP'S LOG.

OF the many troublesome experiences which it falls to the lot of the seaman to encounter, one of the least palatable is that of 'doing quarantine.' Jack, to be sure, loves his leisure just as much as his betters, but he prefers it on shore, and with a modicum of the gaiety and liberty which an enforced spell of idleness under the hated dominion of the yellow flag denies him. Say that his vessel has dropped anchor in the ten-fathom water of some foreign port, and after being boarded by a posse of brass-bound Health Officers, has been condemned to a two weeks' quarantine. What situation could be more tantalising than Jack's, when, day after day, while he is enduring a sweltering idleness on board, which the mate makes desperate attempts to relieve by setting him to scrape and polish and oil the ship's furniture, he sees the loungers lounging on the distant quay; the open door of the *cabaret*, through which there is a constant ebb and flow of customers—those who go in halting a moment on the step to discharge themselves of their quids; those who come out wiping bearded lips on the back of hairy hands. And then, after nightfall, to see the harbour lights shining cheerfully, invitingly, across the intervening tide; to hear the whisper of fiddle-music coming from the shore; and to think of the jollity and the jigs that are going forward, and the glasses and lasses that are going round, in the warmth and light and clatter of the dancing saloon! Cooped up within the narrow limits of his fore-castle, Jack sees and hears and thinks of it all, and it makes him growl and swear a little to himself, like 'a bear with a sore head,' as the saying goes.

Yet he has much to be thankful for, if he could bring himself to be thankful for anything. He might, with all the reason in the world, congratulate himself, for example, on being a modern, instead of—as might easily have been the case, had the clock of his nativity been put back a century or so—an Ancient Mariner. The world has become a better and more comfortable place to live in since Seventeen Hundred odd, and so has the sea. Those of to-day who go down to it in ships take with them all sorts of land-comforts—electricity, steam, ice, potted meats and vegetables, pianos, bar-tenders, and all the rest of the adjuncts of civilisation. To be sure, few of these things ever go before the mast; but the 'shellback' has plenty of other reasons, including aids to comfort and safety, to thank his stars—to wit, the polar ones—that he is what he is to-day, instead of being his own ancestor, in the same walk of life, of a hundred years ago. For one thing, quarantine, irksome as it is, is not the dreaded and even dangerous penance which it formerly was. A fortnight of the yellow flag at the present time is considered a long sentence; in the last century, the conditions of public health being similar, such a confinement was an occurrence of exceptional clemency. In the wretched state of the sanitation, the very first

principles of which were ignored and unknown, the frequency and virulence of plagues were not to be wondered at; it is, indeed, much more a matter for wonder that when one of the great epidemics got a firm hold on any city of the Old World, it ever stayed its hand till every man and beast had perished out of the filthy, narrow, undrained streets and squares.

The ports of the Mediterranean were the cradles of the Plague, as they were the graves of its victims. The more dirt, the more death; and as the North African towns in Tripoli, Tunis, and Algiers took the palm for the first, they easily carried it off for the second also. What scenes of cruelty, bloodshed, disease, despair, and, to end all, of death, must the shores and waters of that great inland ocean have witnessed! If you stayed at sea, it was ten chances to a poor precarious one that you fell a prey to a horde of ravening Barbary pirates; if you dodged those water-rats and got ashore, the odds were out of all proportion that you fell a victim to the Black Death, and left your goods and chattels to be squabbled for between the hungry officials of the Algerian Dey and the Great Turk; while your bones were picked clean by the kites and the dogs, for you were only a Feringhi and an Infidel, and not worth the cost of burial. Some conception of the widespread terror of the Plague, which drove men to adopt the most frantic and destructive measures for the prevention of contagion, may be gathered from the log of the sloop *Fawey*, forming the appendix to Dr Dale Ingram's *Historical Account of the Plagues of the World*—printed at the Rose, for R. Baldwin, 1755.

On the 19th of June 1753, this sloop (Isaac Clemens, commander) sailed from the Downs for Algiers. After a prosperous voyage, they sighted Cape Cassan on the 2d of August; but in consequence of light and variable winds, it was not until the 9th that they dropped anchor in 'Algier Mould.' There were conflicting reports as to the presence of the Plague in the port at that time; Captain Clemens, however, seems to have been convinced, and subsequently made an affidavit to the effect, that there was no Plague in the town when he landed. Like the energetic man that he was, the captain lost no time in whipping the cargo out of his vessel; and when that was done, he set his men briskly to work cleaning out the hold, stoning the decks, calking the sides, and generally getting everything ship-shape for taking on board the home-cargo. On August 21, the ballast was unloaded, and the consignment of merchandise for England began to arrive. Some three hundred dried hides and bundles of skins, two hundred casks of sugar, and forty-four bags of canary-seed, were stowed under hatches by the last day of August. Most of the crew were told off on September 4 to go ashore to the merchant's house, where they were employed 'in packing the skins, bagging the canary-seed, and pocketing the flax and wool,' which, though it sounds sufficiently felonious, was quite in order. 'The same day,' adds the skipper in that laboured logbook of his, 'a Turkish ambassador arrived from Tunis in a bilander,' to deliver to the Beglerbeg of Algiers, half-king, half-pirate, the compliments and cautions of his suzerain, the Great Signior at Stamboul, lord-paramount of those seas and lands.

'Sept. 7. Ship'd canary-seed, 6 bags; flax, in bags, 10. This day an English snow and a Danish ship sailed for Europe.' The 'snow' referred to was a vessel built something after the fashion of the brig, of Dutch derivation. From the 10th to the 19th of September they were busy putting under hatches hogsheads of wine, bags of wool, and skins and flax. At noon, they weighed and stood out to sea in their little craft, no doubt with a fine healthy stench on board from that heterogeneous cargo of hides and skins and wine-casks sweltering under a blaze of sunlight. Having only one deck to bless themselves withal, the crew were compelled to sleep and eat on the top of the canary-seed bags and the wool, and it is to be hoped that the rats and the fleas were mercifully disposed to let them alone. So light and shifty were the winds, that it was not before the end of the month, at nine in the morning, that the *Fawey* ran in and anchored in Gibraltar Bay.

'October 1. The product-master came on board, examined the vessel, and ordered a quarantine of six days; next day, weigh'd, and run up further in the bay.—5. The ship had product allow'd her.—6. Water'd the ship.—7. Took in bread, and deliver'd a bale of goods, and at noon weigh'd anchor and sail'd.—21. Spoke at sea with a snow from Dublin, bound to Cadiz.—24. Spoke with the *Prince George*, from St Christopher, bound for London.'

It appears, from the frequent soundings taken, that they skirted along the landward curve of the Bay of Biscay very cautiously and slow. The dreaded Ushant was left bearing south-and-by-east six leagues. On the 4th November, the Start was made west-by-north, and in the afternoon they reached Portland Roadstead. Few or no precautions were taken to isolate the newly arrived vessel; on the contrary, the townsfolk gave her a hearty and open welcome. All the crew and the passengers, glad to escape from their stuffy malodorous quarters and stretch their legs ashore, turned out and landed, all 'except Mr Brown,' a passenger from Algiers, who, for some unexplained and inexplicable reason, preferred to remain behind among the hides and the skins and canary-seed. A liberal man, skipper Clemens sent on board to his steward for some choice Algerian wine, which he kept by him for the emergency of a great occasion, and generously treated several principal merchants of the place with that and with 'almonds and other things.'

After a couple of days of relaxation, fresh meat and hospitality, they took Mr Pilot Slaughter on board, and stood out for Guernsey, which was the destination of the sloop; and here it was that their troubles began. As in duty bound, Captain Clemens went ashore and waited on the governor of the island, with whom, while their business was being despatched and the ship's papers exhibited, he had the honour of drinking a glass of Frontinac. The bill of health proving to be 'clean,' no objection was made to the sloop's coming into the harbour. All seemed to promise a prosperous ending to a prosperous and lucrative voyage, when, by great ill-luck, as the skipper was marching down town after his satisfactory interview with the governor, he was met by some self-important peremptory individual, who stopped him in full career, with that Frontinac under

hatches below his 'longshore vest, and demanded who and whence he was. After an angry stare at this impertinent, the choleric skipper gave him some sort of rough answer, to the effect that he was Captain So-and-so, of the sloop *Fawey*, from Algiers. High words passed between them in the street, no doubt to the unbounded delight of the neighbourhood, which, after the retreat in dudgeon of his interpolator, would hasten to apprise the burly skipper of the alarming fact that the gentleman in black with the periwig and the horn spectacles was no other than His Serene Highness the Attorney-general of Guernsey himself. The quarrel soon bore fruit of a very bitter kind for Clemens. At the instigation of the Attorney-general, a council was summoned, which, after a little biased deliberation, ordered the captain to perform forty days' quarantine in the Great Road. But the malice of his enemy, or the trepidation of the governor at the proximity of a vessel from a Mediterranean port, uninfected though that port was at the time, allowed Clemens no breathing-space, for by nine next morning orders were sent him to get under sail at once or the castle guns would open fire on him.

'It then blowing a hard gale of wind, sent ashore to the governor begging we might lie till the weather abated; which was refused. At eleven unmoor'd, though we had three anchors down.—9. Blew hard from E.S.E. with strong gale; ship'd several large seas, though under double-reefed mainsail and jib; at seven, took third reef in of mainsail.—12. At four in afternoon anchor'd in Portland Road in six fathom. At six, the Customs boat came on board and ordered us to proceed to the Muther Bank to perform our quarantine.' From some cause or other, the occasion for which is not forthcoming in the log, the authorities appear to have become thoroughly scared about the condition of that sloop. Almost eight weeks had elapsed since her departure from Algiers, and yet no sign of sickness had visited any of the crew or passengers, nor was there any shadow of justification for the inveteracy of the authorities in condemning an apparently uninfected vessel to sixteen weeks' quarantine, and, at the expiration of that weary time, in putting the finishing touch to their proceedings by sinking the sloop with all her cargo on board.

The journal of their imprisonment on the *Fawey* at the Muther Bank is one long record of the alternate receipt on board of coals, beer, and fresh beef. 'Feb. 1. A man-of-war's boat called alongside to know from whence we came, with an intent to press the men.' Then followed more beer, coals, and beef. By the middle of that month it had been resolved on to scuttle and sink the long-suffering little craft, for which purpose the smith paid them a visit, bringing bars to secure the hatches with. Boatloads of iron ballast, more beer and more coals, followed in due course. The sloop was to be conveyed to her burial-place in the Channel by the *Arundel* man-of-war, and a brig, 'appointed by the government to receive us after our sloop should be sunk.' The three of them weighed anchor on March 6, and stood out to sea. On the next day but one, in forty-three fathoms of water, the deed was done. The topsail-yards were handed down, and more ballast was piled into her hull.

'At eight, the commodore sent orders to hoist our colours as soon as we were ready for sinking. At nine hoisted our colours at the topping-lift; the commodore came alongside, and order'd us to let go our anchors. We let go our best bower, and weered it out to the bitter end; and after that our small bower.'

That must have been a sad sight out there at sea on that cheerless wintry day—the doomed little craft with its two consorts swinging their masts under a northerly wind and a falling rain. When all was ready, the gallant captain put his wife into one of the brig's boats, and his crew swarmed after, all of them in temporary gowns made of 'ozenbrigs,' with 'neither shift, petticoat, nor cap among them;' for their own clothes they had left on board the sloop, according to orders, as likely to be tainted. Of these 'ozenbrig' garments they were relieved as soon as they reached the deck of the brig, and other more seasonable clothes were given to them. But it was a bitter experience for them, sitting shivering under the wintry rain in the little open cockboat, watching the sloop gradually fill and settle in the water; and the wonder of it is that Mrs Clemens and Sarah, her maid, suffered no ill effects from that long exposure in their inadequate ozenbrig gowns. The *Fawey*, with her hatches battened down and both anchors out, was scuttled fore and aft in several places, and, as the water poured into her, she went down slowly at first, settling by the stern, until her decks were almost flush with the waves, when she popped out of sight in a moment, with kit and cargo, and left nothing behind her but a whirling maelstrom of bubbles where she had gone down, 'which was at one quarter past ten in the morning.'

Even then, the penance of that ill-starred crew was not at an end, for they were quarantined in the brig on the Muther Bank for a further period of sixteen days before they were permitted to go about their business. It would seem that in those good old Plague-days the mariner who was merely suspected of having the distemper on board his ship was treated with the scant courtesy of a felon convicted of a crime, isolated from his fellows, boxed up in quarantine for eighteen weeks, and, to cap all, the authorities, reckless in their cowardly fright, scuttle the vessel under him with all his goods on board, and turn him adrift to find another berth for himself where he may.

MARCH WINDS.

THE equinoctial gales that usually herald the stormy month of March with lion-like fierceness are, as a rule, of the greatest use to the agriculturist. The old and trite adage, so well known, 'A bushel of March dust is worth a king's ransom,' has more reason in it than is at first supposed. Solomon says, 'The king himself is served by the field;' from which it is fair to infer that the king's ransom, be it ever so costly, is a trifle compared to the state in which the fields are left by the weather at the end of March. 'A dry March never begs its bread,' and 'March grass never does good,' are the antithesis of each other; but show that when, from some natural cause, early

March is mild and showery, there must follow dry nipping winds later on in the season, that chill the growth of the tender young fibres, and prevent the roots sprouting again with their first vigour. Therefore, the wild blustering winds, and sharp driving storms of rain and sleet, in the beginning of the month are welcome in many ways, and warrant the saying that when 'March comes in like a lion it goes out like a lamb.'

People living in large towns can form little idea of the roarings of a March wind, though they often experience its destructiveness in the falling of old walls and stone projections, whirling chimney-pots and broken windows; but it is when one stands at the wood-side or on the precincts of a pine-forest, in the gray duskiess of a March twilight, that the sullen roar of the rushing wind through the leafless trees can be fully heard, understood, and perfectly realised. William Cullen Bryant has a good descriptive poem on the subject, beginning :

The stormy March has come at last,
With wind, and cloud, and changing skies;
I hear the rushing of the blast,
That through the snowy valley flies.

The wildness of March storms, hissing and seething along the earth and hedgerows, and amongst the rustling dead reeds in the water-courses, has something weird in its fierceness; and when great blasts shake the noble timber-trees to their roots, often laying them prostrate with tremendous crashes, and we stand alone in the gathering darkness, the young moon fitfully shining with watery light between the clouds, and on the wet stems and trunks of the trees, the rushing blasts driving through the vault of heaven, it is not a mere figure of speech to say that 'March roars like a lion,' for a hundred lions could not awake amongst the forest trees such voiceful roarings and plaintive moanings as the equinoctial gales of a stormy March.

Occasionally, these storms are alternated by clear days of calm sunshine, which make thoughtful minds wonder where the winds and clouds are gone which a few hours previous were whirling all before them—gone, as if they never existed. In the calm of the surrounding things, one is tempted to walk abroad and enjoy the returning genial rays of the sun, and look out for the young buds on trees and hedgerows, and listen to the faint, half-developed song of the early pairing birds, and the baby-cries of the young lambs from the home-meadows. We wander down into the coppice and note the advent of the gray and greenish-yellow tassels of the catkins on osier or willow, that are dancing merrily in the gentle south-west wind, as it sweeps through the boughs of birch and hazel, that have still their soft sheaths of shining brown, enfolding the young budding leaves. Not for long will they be required, if this spring-like weather continues; indeed, where the sun has shone more warmly in sheltered corners, many of them have already fallen, leaving a flower-like tuft of downy pinkish

green in their places. The chestnut buds have been ready to open their gummy outer coverings for some days, and are this morning folded back, showing the gem-like cones of vivid colour in their woolly cradles.

We hear from amongst the light vaporous clouds floating over the tender blue sky the 'clear keen joyance' of the skylark; and the primrose-hued rays of the morning sunshine light up the bright green and crimson buds along the hedges, gleaming on the fragile blossoms of the blackthorn, that are the sport of every passing breeze. The brown fronds of the ferns have begun to swell and take a look of life upon them; and just 'under the brown of last year's leaves' is nestling a bunch of violets of deepest purple, filling the air with the ravishing sweetness of their delicious perfume. The aconite is in full bloom, set in its beds of dark-green leaves, like drops of molten gold. All the countless varieties of grass and herbage are stirred into life by the warm sunshine, and take beauty from the gentle pattering showers that descend suddenly from the vapoury clouds overhead. The drowsy bees begin to leave the hives and take short flights in the air and bustle about, as if trying their wings after their long hibernation. Bright gold and green and purple beetles are sunning themselves on the old walls and bark of trees, amongst the brown-green mosses; the groundsel and chickweed just swelling into succulent morsels, for the swarms of birds that are flitting hither and thither in their search after building materials. The blue-tit has nearly finished her dainty feathery nest in the forked branches of a tree amongst the clinging ivy; and the vernal notes are audible for a considerable distance. The ringdoves are once more cooing in the thick plantations; and the rooks are holding high parliament in the tops of the elms, swaying about on the lofty boughs with hilarious greetings to each other—some busied in repairing their nests, others taking wide sweeping flights over and round their 'happy hunting-grounds,' and cawing wisely upon the probable number and excellence of the meals to be found thereon.

The wild arum and whitlow-grass can already be found in the damp patches of moss in secluded ditches; and here and there the golden daffodils are blossoming in rich profusion—

And then my heart with pleasure fills,
And dances with the daffodils.

Very soon the budding indications of March vitality will open their valves to the balmy rain, and softer, brighter sunshine of an April day; and will expand their embryo leaves of golden green to the songs of the many-voiced choristers that are making the gardens ring with music, and the woods and plantations re-echo their exquisite melody. The prismatic bow of promise will span the horizon, and make the saddened 'heart leap up' when the eyes 'behold a rainbow in the sky.'

While we pursue our homeward way with pleasant musings through the coppice and lanes, our watchful ears catch a different tone in the western breeze, and lo! a soft, subdued, surging sound rises in the welkin afar off, giving a monition in its sighing whisper of a rough whirlwind of storm coming upon us, that has been sleeping amongst the distant hills, and is now

fast hasting, gathering, as it rushes through the valleys, all the local eddies and currents to blend with its greater volume, till it breaks through the coppice in a blustering whirlwind.

FOUL AIR IN WELLS.

We are constantly reading of lives lost through men incautiously descending wells, pits, and underground passages without previously taking the trouble to ascertain whether the air in them be fit to support life or not. Any air that will not support combustion is unfit for respiration; no animal or human being can live in it. It is this kind of air, or more strictly gas, which, escaping through the cracks and crannies in the sides of disused wells, or proceeding from the decay of organic matter, accumulates at their bottom a ponderous, suffocating mass, known as carbonic acid gas, and called by miners choke-damp.

The practice of letting down a *naked* lighted candle to test the purity or otherwise of the air below is pregnant with danger, since the gas may be of an inflammable nature. The candle should in all cases be securely caged in fine wire-gauze, on the principle of the Davy safety lamp. If it continue to burn, the air is wholesome; if it be extinguished, it is not. Some years ago, a gang of workmen were employed in cleaning a large vault in Arlington Street, and discovering a spring of water, one of them put down a lighted candle to take a fuller view of it, when the foul air took fire, and was with difficulty extinguished. In August 1770, a dreadful accident happened at Sir James Lowther's colliery at Seaton. Some foul air was suspected to be in the pit; and the men, not being permitted to go down, let down a candle in an ordinary lantern, which set fire to the air, which exploded with such a violent report as to be heard at Cockermouth, six miles distant. Three men were killed on the spot and many others seriously injured. (This was due to the presence of carburetted hydrogen—that is, firedamp—and is only given as an example of the necessity of taking every precaution.)

The various means of clearing out the impure air are very simple. One plan—though we do not recommend it—is to let down an iron pot containing a few ounces of gunpowder, and then to toss a shovelful of live coals after it, some of which are sure to fall into the pot, and the consequent explosion will effectually dispel the noxious vapours. Another and a better method, common among professional well-sinkers, is to lower buckets containing fresh-slaked lime before they attempt to descend, because, if carbonic acid be present, the lime will absorb it, to form carbonate of lime. The drawback to this is, that the combination of bodies always takes place in certain fixed and definite proportions, so that a certain quantity of lime will absorb only a certain quantity of gas, and we cannot tell when all the carbonic acid has been absorbed.

A more satisfactory way is to pump it out, for, being more than half as heavy again as the atmosphere, it will, though invisible, flow through it like water. Its presence can, however, be detected by its pungent odour. But the best plan is to drive it out by pure air. Procure a pair of smith's bellows and a leathern tube, such as the hose of a fire-engine: fix one end of the tube closely to the

nose of the bellows, and throw the other into the well, so as to reach within a foot of the bottom. Half an hour's blowing will cleanse the foulest pit; and where, before, a lighted candle would have been extinguished at a short distance from the top, it will now burn brightly at the bottom of the well. But we must bear in mind that, should the flame become at all dim, it will be unsafe to descend, for experience has shown that combustion may continue for some time in an atmosphere dangerously charged with carbonic acid, and that air containing only one-twelfth of its volume of this deadly gas causes suffocation.

TO SPRING.

A SICK GIRL'S INVOCATION.

COME forth, most beauteous Maid,
Nor let me yearn in vain;
I am so young to droop and fade,
Oh, lead me from this bed of pain.
Bear me to sunny bowers
Where happy song-birds sing;
Crown me with fresh young leaves and flowers,
And I will bless thee, lovely Spring.

A form of beauty, stand
Beside my little bed;
Hang round my neck with thy fair hand
A chain of daisies, white and red.
From these poor fevered lips,
The bitter draught, oh, fling!
I'll drink the dew the wild-rose sips,
From thy bright goblet, generous Spring.

For that blest draught, I know,
Hath caught its changeable hue
From hawthorn buds that sweetly blow,
Fair cowslip bells, and violets blue.
It thrills poor drooping hearts,
And bids slow pulses sing;
To fainting souls new life imparts.
Come, let me drink, thou balmy Spring.

When merry sunbeams play
Upon these cheerless walls,
I hear in valleys far away
The tinkling of the waterfalls.
I hear once more the lark,
And see his fluttering wing;
Then search all vainly in the dark
For thy dear blossoms, bounteous Spring.

Though wagons, all day long,
Go rumbling down the street,
I hear the distant river's song,
I hear the merry lambskins bleat.
A happy child once more,
In leafy boughs I swing.
Ah, life is sweet, and pain is o'er;
Thy breath doth heal me, heavenly Spring.

THE CHILDREN'S WARD.

STANDING back a little from the noisy street, and rising in grand silence, is a large gloomy building studded with regular rows of long windows. It scarcely needs the inscription—'East-end Hospital; Supported by Voluntary Subscriptions'—running along the front in large letters, to tell us we are standing before one of those tremendous monuments of human suffering, the contemplation of which must cause the hardest heart to ache. There, where the strife and noise of the world are shut out, and the stillness of pain reigns paramount, the grim struggle against death and disease is always carried on. Day and night, though there is never noise, there is ever movement throughout that great building; and when all the surrounding houses are dark and the traffic hushed, lights still shine from those numerous windows, and the unceasing care of the sick and suffering continues without arrest.

Though the hospital displays a large frontage to the busy street, its full extent is not at once visible to the eye. There are four wings stretching back from the main building, which have been added at different times; and beyond these, again, are various houses appropriated to the use of the matron, chaplain, nurses, and others. The space enclosed by these edifices forms a small sheltered garden, where the patients approaching convalescence can sit and sun themselves; where the students can get a game of tennis, or the nurses stroll beneath the shade of a few sooty limes. The size of the wings just permits of two long parallel wards, connected by open arches, on each floor; and the two wards on the ground-floor of the western wing are those set aside for the treatment of children. They are the brightest wards in all the hospital: there are more pictures on the walls, more plants in the windows, and gayer quilts on the beds, than in any other part of the building. Fifty little cribs are ranged in rows down the walls, and in nearly every crib a small child, clad in a scarlet jacket, is sitting or lying. Here and there between the

tables which occupy the centre of the ward are swinging cradles with red curtains; also a doll's house, a rocking-horse, and reclining or wheel-couches break the monotonous line of beds. Altogether, the effect is one of brightness, light, and space: the long perspective of tidy cribs, the nurses in white caps and aprons, and the spotlessness of tables, lockers, and all other articles, appear almost miraculous in contrast with the smuttiness and dirt which pervade most private houses and offices in London.

Though all the small patients are suffering from some injury, the sound of moans or sobs is seldom heard; rather there is a gentle noise of laughter and childish chatter, and the patter of small feet on the boarded floor. Coming into these cool airy wards out of the endless rush and noise of city streets, there is a sense of peace and rest; and one immediately divines that it may be a good thing for many a child to be forced to abide for a while in this atmosphere of cleanliness and order. From hunger and want and dirty overcrowded homes, these little ones, when their misery culminated in some accident or illness, have found their way to this pleasant place, where there is always plenty to eat and lots of light and fresh air; where toys are plentiful, and boxes play music, and a gentle, skilful nurse pays attention to all those small wants, which, too probably, were utterly neglected by a drunken or an overworked mother. We hear so much about 'maternal instinct' and a 'mother's care,' that we are apt to overlook the well-established fact that in the outside community one child in every five dies from improper feeding or carelessness. There is no limit to the indiscretions of an East-end mother; she regards beef-steak and gin as suitable nourishment for a year-old baby; or will shut a child of two up in a room where there is a large fire blazing and no guard. What wonder that one of the 'Sister's' hardest duties is to return the child her constant skilled care has saved, back to the parents whose heedlessness had wrought the ill; for no woman can tend a child through-

out a long period of pain without learning to love the little morsel who turns so naturally to her for comfort and relief. To see a small child, when the surgeons have gone, nestle down in a nurse's arms and smile contentedly with the tears yet wet on its cheeks, makes it evident that though the nursing of children is the most trying work demanded of a woman, yet the reward is proportionately great.

It is a pity that so many of us, as we grow older, forget the trials and troubles of our childhood, and from the standpoint of a developed reason and strengthened body, look with contempt upon the petty sorrows of babes. The grown man may well bear pain with patience if he knows that it is a necessity, and that cure will come with time; but a child lives only in the present, and has no philosophical reasons for sustaining afflictions with calmness: it only knows that it is miserable, that it is hurt in some way; and is not in the least relieved by being told that it is all for its good, and that it will be better presently. This is not the way the intelligent nurses in the ward deal with a suffering child: they pick it up, give it the sympathy it craves, and then stopping before the doll's house or the window, point out some object of interest, and divert the small mind from its grief. It is really wonderful to see how these women, who have lived much amongst ailing children, learn to interpret the appealing look or hasty flush aright. Some of us can perhaps discriminate when a child is crying from passion or pain, but a nurse trains her sense of hearing till she knows whether the pain is an ache or a smart, whether the child is hungry or is tired. The language of a cry is plain to her discerning ears, and when read in connection with the expression of the face and the posture of the body, always leads to a correct conclusion.

Looking down the pleasant ward, where so many cheerful faces can be seen, it is hard to realise that into each of these little lives the tragical element has already entered—that all these children have received a baptism of suffering. A boy of three in a tent-bed by the fireplace had tried to drink out of a boiling kettle standing on the hob, with the result that the mouth and throat had been so scalded with the steam that he was brought to the hospital black in the face and nearly dead of suffocation. The operation of tracheotomy had been immediately performed—that is, a slit had been made in the windpipe close to the 'Adam's apple,' and in this a silver tube was inserted, through which the boy was breathing, the top of the throat being so swollen that it was completely closed. The boy was doing well. In a few days, when the scald was better, the tube would be removed; the slit would heal rapidly, and the child be shortly discharged quite cured. This is a common accident, and a week seldom goes by without bringing a case of this kind to the children's ward.

One small patient was completely unconscious, very pale, but breathing quietly. He had fallen from a running express train, and his friends, when they saw the door suddenly fly open and the child precipitated from their view, never hoped to see him alive again. Before the train could be stopped, they were miles from the scene of the accident; but the guard promised to send

help from the next station. At first, the boy was thought to be dead; then, when it was found he was still breathing, his recovery was despaired of; yet he had lived several days, and there was now hope. It was strange that the child had received no special injuries, being merely bruised and stunned by the shock.

A baby in one of the red-curtained cradles was a pitiful sight. Though three months old, it only weighed six pounds, and its face was wrinkled like that of an old monkey. From its birth, this poor piece of humanity had suffered for the sins of its fathers, and it made the heart swell with indignation to hear the weary wail which constantly broke from its lips.

Infants a few days old are not uncommonly received as patients, and of course they call for a great amount of attention. Forty ailing girls and boys all under seven, and four or five sick babies whose age can be reckoned by weeks, is a family that any woman might dread to have charge of. No wonder the Sister of the children's ward has weary lines around her mouth, though you scarcely notice them because of the sweet smile which dwells there. First, one baby has to be picked up and comforted; then a batch have to be packed in the wheel-couch and sent out into the garden; then a boy of five, whose head represents a model of bandaging, has to be given the promised treat of bread-and-butter and sugar in Sister's room, because he rocked the cradle till the 'white baby' fell asleep. This is the highest honour and reward a small patient looks for—to be allowed to sit in Sister's room for a while. There is a small cushioned chair in the corner by the fireplace, specially devoted to good girls and boys; in the cupboard are some toys; and often a piece of plain cake appears from the same shelf. The small room, full of pictures and flowers and a hundred dainty nicknacks, is such a cosy contrast to the long bare ward, that the children delight to be allowed to enter its sacred precincts. It never occurs to their small minds to regard that room as a woman's chosen home; yet there, in that corner cut off the ward, the Sister lives and sleeps from year's end to year's end, ever in the midst of her suffering charges, and within hearing of the work going on around. There is a pane of glass in the door; and if in the night there is the tramp of the surgeon's feet, or an unusual amount of crying, the Sister slips from the small bed and looks to see if she is wanted.

Amusing as well as painful sights can be seen from that door; for instance, there is a young student who has put the wrong side of the strapping plaster to the hot-water tin, with the result that it has firmly adhered to the vessel. As he drags it off, he looks sheepishly around, and is evidently pleased there is no nurse near—knowing nothing of the merry eyes watching him from the curtained door. But the spotless tin is smeared, and will tell tales; the hapless student is seized with a wild idea, and tries to clean it with a piece of cotton-wool. The fluff adheres to the sticky tin, making matters worse, and the desperate student beats a hasty retreat, while the Sister sinks back in peals of laughter.

It is pleasant to see how the students become boyish and gentle on entering the children's ward, and drop the airs they are apt to affect in other parts of the building. Their little patients become

very fond of their 'doctors' sometimes; and the powerful young fellows can so easily lift the tiny mites, and move them into more comfortable positions. At Christmas-time, when there is a tree in the ward, and all the cribs have to be turned in one direction, the students use their strong arms with a will; and also stride about from ward to ward, finding out all the children that have for some reason been lodged amongst the adults, and carry them off to be present at the treat. One winter afternoon a tall student came into the ward bearing, perched on his shoulder, a small girl with a pathetic face.

'Sister, Bessie's mother has brought her to the receiving-room, and says she has cried ever since she was discharged yesterday.'

'What is the meaning of that, Bessie?' asks Sister in those severe tones which never seem to awe the children. 'If I let you stay here to tea, will you go home to bed like a good child?'

'Yeth, Thithter,' lisps the pale little thing.

'Then, if you like to put her down in front of the fire for an hour or two, Mr Smith, you may; only, you must come and carry her home before six.'

'Very well. Only I wonder what you will ask me to do next?'

Sister and student laugh, and go their own ways, while Bessie lies quiet and contented before the blazing fire.

The rules and regulations are not nearly so strict in this ward as the others; and both house-governor and matron will be conveniently blind to small deviations where the children are concerned. Indeed, it would be a strange thing if all the sympathy and loving-kindness which sickness always calls forth were not doubled in the case of these small sufferers, on whose tiny shoulders such grievous burdens have been bound. The children's ward always has been, and always should be, the recipient of all the spare love and charity of those who, rather than gold or honour, would 'win one little child's caress.'

THIS MORTAL COIL.

CHAPTER XIV.—LIVE OR DIE?

AND all this time, what had become of Elsie and the men in the *Mud-Turtle*?

Hugh Massinger, for his part, took it for granted, from the moment he came to himself again on the bank of the salt marshes, that Elsie's body was lying unseen full fathoms five beneath the German Ocean, and that no tangible evidence of his crime and his deceit would ever be forthcoming to prove the naked truth in all its native ugliness against him. From time to time, to be sure, one disquieting thought for a moment occurred to his uneasy mind: a back-current might perhaps cast up the corpse upon the long dike where he had himself been stranded, or the breakers on the bar might fling it ashore upon the great sands that stretched for miles on either side of the river-mouth at Whitestrand. But to these terrible imaginings of the night-watches, the more judicial functions of his waking brain refused their assent on closer consideration. He himself had floated through that seething turmoil simply because he knew how to float. A woman, caught wildly by

the careering current in its headlong course, would naturally give a few mad struggles for life, gasping and gulping and flinging up her hands, as those untaught to swim invariably do; but when once the stream had carried her under, she would never rise again from so profound and measureless a depth of water. He did not in any way doubt that the body had been swept away seaward with irresistible might by the first force of the outward flow, and that it now lay huddled at the bottom of the German Ocean in some deep pool, whence dredge or diver could never by human means recover it.

How differently would he have thought and acted all along had he only known that Warren Relf and his companion on the *Mud-Turtle* had found Elsie's body floating on the surface, a limp burden, not half an hour after its first immersion.

That damning fact rendered all his bold precautions and daring plans for the future worse than useless. As things really stood, he was plotting and scheming for his own condemnation. Through the mere accident that Elsie's body had been recovered, he was heaping up suspicious circumstantial evidence against himself by the forged letter, by the night escapade, by the wild design of entering Elsie's bedroom at the Hall, by the mad idea of concealing at his own lodgings her purloined clothes and jewelry and belongings. If ever an inquiry should come to be raised into the way that Elsie met her death, the very cunning with which Hugh had fabricated a false scent would recoil in the end most sternly against himself. The spoor that he scattered would come home to track him. Could any one believe that an innocent man would so carefully surround himself with an enveloping atmosphere of suspicious circumstances out of pure wantonness?

And yet, technically speaking, Hugh was in reality quite innocent. Murderer as he felt himself, he had done no murder. Morally guilty though he might be of the causes which led to Elsie's death, there was nothing of legal or formal crime to object against him in any court of so-called justice. Every man has a right to marry whom he will; and if a young woman with whom he has cautiously and scrupulously avoided contracting any definite engagement, chooses to consider herself aggrieved by his conduct, and to go incontinently, whether by accident or design, and drown herself in chagrin and despair and misery, why, that is clearly no fault of his, however much she may regard herself as injured by him. The law has nothing to do with sentiment. Judges quote no precedent from Shelley or Tennyson. If Hugh had told the whole truth, he would at least have been free from legal blame. By his extraordinary precautions against possible doubts, he had only succeeded in making himself seem guilty in the eyes even of the unromantic lawyers.

When Warren Relf drew Elsie Challoner, a huddled mass, on board the *Mud-Turtle*, the surf was rolling so high on the bar, that with one accord he and Potts decided together it would be impossible for them, against such a sea, to run up the tidal mouth to Whitestrand. Their piteous little dot of a craft could never face it. Wind had veered to the south-east. The only

way possible now was to head her round again, and make before the shifting breeze for Lowestoft, the nearest northward harbour of refuge.

It was an awful moment. The sea roared onward through the black night; the cross-drift whirled and wreathed and eddied; the blinding foam lashed itself in volleys through the dusk and gloom against their quivering broadside. And those two men, nothing daunted, drove the *Mud-Turtle* once more across the flank of the wind, and fronted her bows in a direct line for the port of Lowestoft, in spite of wind and sea and tempest.

But how were they to manage meanwhile, in that tossing cockleshell of a boat, about the lady they had scarcely rescued? That Elsie was drowned, Warren Relf didn't for a moment doubt; still, in every case of apparent drowning, it is a duty to make sure life is really extinct before one gives up all hope; and that duty was a difficult one indeed to perform on board a tiny yawl, pitching and rolling before a violent gale, and manned against the manifold dangers of the sea by exactly two amateur sailors. But there was no help for it. The ship must drift with one mariner only. Potts did his best for the moment to navigate the dancing little yawl alone, now that they let her scud before the full force of the favouring wind under little canvas; while Warren Relf, staggering and steadying himself in the cabin below, rolled the body round in rugs and blankets, and tried his utmost to pour a few drops of brandy down the pale lips of the beautiful girl who lay listless and apparently lifeless before him.

It was to him indeed a terrible task; for from the first moment when the painter set eyes on Elsie Challoner, he had felt some nameless charm about her face and manner, some tender cadence in her musical voice, that affected him as no other face and no other voice had ever affected him or could ever affect him. He was not exactly in love with Elsie—love with him was a plant of slower growth—but he was fascinated, impressed, interested, charmed by her. And to sit there alone in that tossing cabin, with Elsie cold and stiff on the berth before him, was to him more utterly painful and unmanly than he could ever have imagined a week or two earlier.

He did not doubt one instant the true story of the case. He felt instinctively in his heart that Hugh Massinger had shown her his inmost nature, and that this was the final and horrible result of Hugh's airy easy protestations.

As he sat there, watching by the light of the one oil lamp, and rubbing her hands and arms gently with his rough hard palms, he saw a sudden tumultuous movement of Elsie's bosom, a sort of gasp that convulsed her lungs—a deep inspiration, with a gurgling noise; and then, like a flash, it was borne in upon him suddenly that all was not over—that Elsie might yet be saved—that she was still living.

It was a terrible hour, a terrible position. If only they had had one more hand on board, one more person to help him with the task of recovering her! But how could he ever hope to revive that fainting girl, alone and unaided, while the ship drifted on, single-handed, tossing and plunging before that stiffening breeze? He almost despaired of being able to effect anything. Yet life is life,

and he would nerve himself up for it. He would try his best, and thank Heaven this boisterous wind that roared through the rigging would carry them quick and safe to Lowestoft.

His mother and sister were still there. If once he could get Miss Challoner safe to land, they might even now hope to recover her. Where there's life, there's hope. But what hope in the dimly lighted cabin of a toy yawl, just fit for two hardy weather-beaten men to rough it hardly in, and pitching with wild plunges before as fierce a gale as ever ploughed the yeasty surface of the German Ocean?

He rushed to the companion-ladder as well as he was able, steadying himself on his sea-legs by the rail as he went, and shouted aloud in breathless excitement: 'Potts, she's alive! she's not drowned! Can you manage the ship anyhow still, while I try my best to bring her round again?'

Potts answered back with a cheery: 'All right. There's nothing much to do but to let her run. She's out of our hands, for good or evil. The admiral of the fleet could do no more for her. If we're swamped, we're swamped; and if we're not, we're running clear for Lowestoft harbour. Give her sea-room enough, and she'll go anywhere. The storm don't live that'll founder the *Mud-Turtle*. I'll land you or drown you, but anyhow I'll manage her.'

With that manful assurance satisfying his soul, Warren Relf turned back, his heart on fire, to the narrow cabin and flung himself once more on his knees before Elsie.

A more terrible night was seldom remembered by the oldest sailors on the North Sea. Smacks were wrecked and colliers foundered, and a British gunboat, manned by the usual complement of scientific officers, dashed herself full tilt in mad fury against the very base of a first-class lighthouse; but the taut little *Mud-Turtle*, true to her reputation as the staunchest craft that sailed the British channels, rode it bravely out, and battled her way triumphantly, about one in the morning, through the big waves that rolled up the mouth of Lowestoft harbour. Potts had navigated her single-handed amid storm and breakers, and Warren Relf, in the cabin below, had almost succeeded in making Elsie Challoner open her eyes again.

But as soon as the excitement of that wild race for life was fairly over, and the *Mud-Turtle* lay in calm water once more, with perfect safety, the embarrassing nature of the situation, from the conventional point of view, burst suddenly for the first time upon Warren Relf's astonished vision; and he began to reflect that for two young men to arrive in port about the small-hours of the morning, with a young lady very imperfectly known to either of them, lying in a dead faint on their cabin bunk, was, to say the least of it, a fact open to social and even to judicial misconstruction. It's all very well to say offhand, you picked the lady up in the German Ocean; but Society is apt to move the previous question, how did she get there? Still, something must be done with the uncovenanted passenger. There was nothing for it, Warren Relf felt, even at that late season of the night, but to carry the half-inanimate patient up to his mother's lodgings, and to send for a doctor to

bring her round at the earliest possible opportunity.

When Elsie was aware of herself once more, it was broad daylight; and she lay on a bed in a strange room, dimly conscious that two women whom she did not know were bending tenderly and lovingly over her. The elder, seen through a haze of half-closed eyelashes, was a sweet old lady with snow-white hair, and a gentle motherly expression in her soft gray eyes: one of the few women who know how to age graciously—

Whose fair old faces grow more fair
As Point and Flanders yellow.

The younger was a girl about Elsie's own time of life, who looked as sisterly as the other looked motherly; a pleasant-faced girl, not exactly pretty, but with a clear brown skin, a cheek like the sunny side of peaches, and a smile that showed a faultless row of teeth within, besides lighting up and irradiating the whole countenance with a charming sense of kindness and girlish innocence. In a single word it was a winning face. Elsie lay with her eyes half open, looking up at the face through her crossed eyelashes, for many minutes, not realising in any way her present position, but conscious only, in a dimly pleased and dreamy fashion, that the face seemed to soothe and comfort and console her.

Soothe and comfort and console her for what? She hardly knew. Some deep-seated pain in her inner nature—some hurt she had had in her tenderest feelings—a horrible aching blank and void.—She remembered now that something unspeakable and incredible had happened.—The sun had grown suddenly dark in heaven.—She had been sitting by the waterside with dear Hugh— As she thought of the name, that idolised name, a smile played for a moment faintly round the corners of her mouth; and the older lady, still seen half unconsciously through the chink in the eyelids, whispered in an audible tone to the younger and nearer one: 'She's coming round, Edie. She's waking now. I hope, poor dear, she won't be dreadfully frightened, when she sees only two strangers by the bed beside her.'

'Frightened at you, mother,' the other voice answered, soft and low, as in a pleasant dream. 'Why, nobody on earth could ever be anything but delighted to wake up anywhere and find you, with your dear sweet old face, sitting by their bedside.'

Elsie, still peering with half her pupils only through the closed lids, smiled to herself once more at the gentle murmur of those pleasant voices, both of them tender and womanly and musical, and went on to herself placidly with her own imaginings.

—Sitting by the waterside with her dear Hugh—dear, dear Hugh—that prince of men. How handsome he was; and how clever, and how generous! And Hugh had begun to tell her something. Eh! but something! What was it? What was it? She couldn't remember; she only knew it was something terrible, something disastrous, something unutterable, something killing. And then she rushed away from him, mad with terror, towards the big tree, and—

Ah!

It was an awful heart-broken, heart-rending cry. Coming to herself suddenly, as the whole

truth flashed like lightning once more across her bewildered brain, the poor girl flung up her arms, raised herself wildly erect in the bed, and stared around her with a horrible vacant, maddened look, as if all her life were cut at once from under her. Both of the strangers recognised instinctively what that look meant. It was the look and the cry of a crushed life. If ever they had harboured a single thought of blame against that poor wounded, bleeding, torn heart for what seemed like a hasty attempt at self-murder, it was dissipated in a moment by that terrible voice—the voice of a goaded, distracted, irresponsible creature, from whom all consciousness or thought of right and wrong, of life and death, of sense and movement, of motive and consequence, has been stunned at one blow by some deadly act of undeserved cruelty and unexpected wickedness.

The tears ran unchecked in silent sympathy down the women's flushed cheeks.

Mrs Relf leant over and caught her in her arms. 'My poor child,' she whispered, laying Elsie's head with motherly tenderness on her own soft shoulder, and soothing the girl's pallid white face with her gentle old hand, 'cry, cry, cry if you can! Don't hold back your tears; let them run, darling. It'll do you good.—Cry, cry, my child—we're all friends here. Don't be afraid of us.'

Elsie never knew, in the agony of the moment, where she was or how she came there; but nestling her head on Mrs Relf's shoulder, and fain of the sympathy that gentle soul extended her so easily, she gave free vent to her pent-up passion, and let her bosom sob itself out in great bursts and throbs of choking grief; while the two women, who had never till that very morning seen her fair face, cried and sobbed silently in mute concert by her side for many, many minutes together.

'Have you no mother, dear?' Mrs Relf whispered through her tears at last; and Elsie, finding her voice with difficulty, murmured back in a choked and blinded tone: 'I never knew my mother.'

'Then Edie and I will be mother and sister to you,' the beautiful old lady answered with a soft caress. 'You mustn't talk any more now. The doctor would be very, very angry with me for letting you talk and cry even this little bit. But crying's good for one when one's heart's sore. I know, my child, yours is sore now. When you're a great deal better, you'll tell us all about it.—Edie, some more beef-tea and brandy.—We've been feeding you with it all night, dear, with a wet feather.—You can drink a little, I hope, now. You must take a good drink and lie back quietly.'

Elsie smiled a faint sad smile. The world was all lost and gone for her now; but still she liked these dear souls' sweet quiet sympathy. As Edie glided across the room noiselessly to fetch the cup, and brought it over and held it to her lips and made her drink, Elsie's eyes followed every motion gratefully.

'Who are you?' she cried, clutching her new friend's plump soft hand eagerly. 'Tell me where I am. Who brought me here? How did I get here?'

'I'm Edie Relf,' the girl answered in the same low silvery voice as before, stooping down and kissing her. 'You know my brother, Warren

Relf, the artist whom you met at Whitestrand. You've had an accident—you fell into the water—from the shore at Whitestrand. And Warren, who was cruising about in his yawl, picked you up and brought you ashore here. You're at Lowestoft now. Mamma and I are here in lodgings. Nobody at Whitestrand knows anything about it yet, we believe.—But darling, and she held poor Elsie's hand tight at this, and whispered very low and close in her ear, 'we think we guess all the rest too. We think we know how it all happened.—Don't be afraid of us. You may tell it all to us by-and-by, when you're quite strong enough. Mother and I will do all we can to make you better. We know we can never make you forget it.'

Elsie's head sank back on the pillow. It was all terrible—terrible—terrible. But one thought possessed her whole nature now. Hugh must think she was really drowned: that would grieve Hugh—dear affectionate Hugh.—He might be cruel enough to cast her off as he had done—though she couldn't believe it—it must surely be a hideous, hideous dream, from which sooner or later she would be certain to have a happy awakening—but at anyrate it must have driven him wild with grief and remorse and horror to think he had killed her—to think she was lost to him.—Oughtn't she to telegraph at once to Hugh—to dear, dear, Hugh—and tell him at least she was saved, she was still living?

BREAKING THE OCEAN RECORD.

AMONG the improvements which have been effected in the arts since the commencement of the present century, the development of ship-building occupies no secondary position. Eighty-eight years ago steam-power had not been practically applied to sea-going vessels, though the idea had been mooted so far back as 1736 by one Jonathan Hulls. To give a general sketch of the advances which have been made in this direction in our own land since the days when the Celts propelled their rudely-shaped, fire-hollowed log-canoes from point to point on the British coast; or the Saxons ventured somewhat farther from shore in their larger galley-like, sail-driven vessels, would—though showing the methods by which increased speed has been attained in traversing the boundless deep—be altogether outside the aim of this article, which is intended simply to present in narrative form some of the more important improvements which have been effected in connection with our mercantile marine during the present century, and to show how they have tended to revolutionise ocean-commerce.

As has been already stated, nine decades ago steam was only beginning to be thought of as a ship-propelling agent, the first experiment in this kind of navigation on the Thames having taken place in 1793; the boat, designed by Rumsay, who had made trials with steam in America, progressing against the tide at the rate of four miles an hour. This, however, would appear not to have been the first experiment of this class made in the country, as it is recorded that about 1788, William Patrick Miller—the patentee of paddle-wheels—and William Symington constructed a small steam-vessel which travelled at a rate of a mile in fifteen minutes. These essays

could not be regarded as successful; but they showed the possibility of attaining a higher speed of ocean-travelling than could be accomplished by the ships of that period; and experiments began to be undertaken in various quarters. But it was not until 1807 that the practicability of steam-navigation as a means of communication was clearly demonstrated, the honour belonging to Robert Fulton, an American, who had gained much information from Symington whilst on a visit to this country; and he, like every other great inventor, had to bear the brunt of ridicule. When he first proposed his plans, his countrymen laughed at him; and when he began to build his vessel, they nicknamed it 'Fulton's Folly.' His personal friends, though civil, were shy of being seen in his company; and whilst they gave ear to his explanations, a look of incredulity overspread their faces. But he held on his way; and when at length the long-expected day of trial came, the boat—a paddle one—christened by her designer *Clermont*, glided from the wharf on the Hudson in the presence of an immense crowd of spectators, who had assembled to gloat over Fulton's failure. Before she had run a quarter-mile, the most sceptical were convinced, and the jeers of the rabble were changed to shouts of acclamation. The success of the undertaking was complete; and thus was introduced the pioneer of a class of vessels which were destined to bring about such a change in the earth's commerce as the world then dreamed not of.

Shortly after Fulton's triumph, Mr Stevens, of Hoboken, launched a steamboat, which he took round to the Delaware; and this was the first steamer that braved the waves of the ocean. From that time, vessels of this description rapidly increased in number on all the American rivers, and soon became the ordinary means of communication.

It was not, however, until 1812 that steam-navigation was put to practical use in England. On the 18th January in that year, Mr Henry Bell, of Glasgow, launched the *Comet*, the first British steamboat on the Clyde. She was employed to convey passengers across the river; and thrice per week she plied between Greenock and Glasgow, a distance of some twenty-two miles, performing the journey at the rate of seven and a half miles an hour—a great improvement on the experiment of Miller and Symington twenty-four years previously. A further advance was witnessed in 1813, when a larger vessel than the *Comet* appeared on the Clyde. She was owned by Mr Hutchinson, and travelled between Glasgow and Greenock at an average speed of nine miles per hour, with one hundred passengers on board. This success gave rise to new projects in other quarters, the principal among these being a small pleasure-boat which, in 1814, began to ply between London and Richmond; and another boat built in Bristol, and sent to London for the Gravesend station, and which had to be withdrawn in consequence of the opposition of the watermen. But this opposition was overcome in 1815 by the *Margery*, a steamer of seventy tons, sent from the Clyde, which maintained her ground in spite of the watermen. Following the *Margery* came the *Thames*, which, calling at Dublin on her voyage from the Clyde to London, was, when sighted off the coast, mistaken by the Irish pilots for a vessel

on fire, and they put off in swarms to the rescue, with a view to salvage.

These must be regarded as the forerunners of those colossal floating palaces which now traverse every sea; for though their rate of progress was slow when compared with that of the present day, their success established beyond a doubt the possibility of ocean-navigation by steamers. Money was freely invested in constructing vessels of this class, which rapidly came into use in the coasting service; and regular lines of communication began to be organised, not only between our own ports, but between this country and such foreign harbours as were then deemed to lie within the limits of steam-navigation; and as the vessels gradually improved in construction, the area of their courses was increased, until at the present day they embrace every port upon the habitable globe.

So much by way of introducing the first ocean record-breakers—to use a sporting term—of modern times; that is, the first vessels which traversed given distances in a less period than had ever before been accomplished.

Coming more closely to the subject of this article, it may be said that it was not until about 1836 that the era of really rapid steamboat travelling commenced. Up to that time, wood was the only material of which ships had been constructed, if we except the fact that, fourteen years previously, iron was introduced as an outer covering for wooden vessels. The idea, however, of building ships wholly of that metal does not appear to have been thought of until little more than half a century ago, though the advantages iron possessed over wood in point of the same strength being obtained with less weight of material, and the cumbersome combinations necessary for solidity in wooden vessels being consequently done away with, must have been apparent to all, to say nothing of the fact, that as iron plates could be rolled to any curve, a more graceful outline could be given to ships than was possible by the use of wood. In favour of iron there was the further fact, that it enabled vessels to be constructed up to any size desired, a thing which could not be achieved with wood, for the reason that beyond certain dimensions it was not safe to go. With the introduction of iron for shipbuilding purposes, the screw-propeller came into practical use. This means of driving vessels had been proposed many years before, and was tried by Shorter in 1802, the power for working the screw being supplied by manual labour. This method of propulsion was of course under the circumstances valueless—a more efficient motive-power was required—and the screw-propeller remained in the background until 1836, when Mr F. P. Smith, an Englishman, and Captain Ericsson, an American, successfully applied it, independently of each other, in somewhat different forms to steam-vessels—Ericsson's craft attaining a speed of ten miles an hour. The screw, after undergoing improvements, is now the principal means of propulsion employed, a greater rate of progress being attainable by this method than where paddle-wheels are used.

The fleetest mercantile vessels afloat ply between Liverpool and New York; and the first steamer of any magnitude to make this passage was the *Sirius*, of seven hundred tons burden, which sailed from Cork on April 4, 1838; and four days later, the *Great Western*, the first paddle-

wheel steamship ever built for the express purpose of crossing the Atlantic, left Bristol. In 1818, Lord Cochrane's *Rising Sun*, and in 1819 the *Savannah*, a steamer of three hundred and fifty tons, had each made the transatlantic voyage, the latter occupying twenty-six days in travelling between New York and Liverpool. But notwithstanding this, the bulk of scientific men declared it was impossible for a steam-driven vessel to accomplish the journey in anything like a satisfactory manner, though the general body of the people believed the thing was practicable enough; and the trials of the *Sirius* and the *Great Western* fully proved that the latter were right, for the voyages of both ships were brilliant triumphs, the *Sirius* reaching New York on April 23, and the *Great Western* entering the same harbour only a few hours later. It is recorded that 'long before their arrival, notice of their coming had been given; and when the ships approached the shores of the greatest commercial city of the New World, they were greeted with flags and banners, and with music and ringing of bells, and the acclamations and applause of unnumbered multitudes. Half the width of the Atlantic had been annihilated, the year had been doubled in its length, and three-fourths of the cause of strife and discord had been destroyed for ever; for ten thousand avenues had been opened of mutual advantage and regard between the two great branches of the most wealthy, the most enterprising, and the most powerful among the nations of the world.' Two years later, the Cunard steamers began to sail, the pioneer vessel being the *Unicorn*, which made the passage from Liverpool to Boston, *via* Halifax, in sixteen days; not bad time for a craft very little larger than an ordinary tug of the present day. In the same year the Oriental Steam-packet Company brought the Indian empire within thirty days' distance of home; the first steam-voyage to that country having been accomplished in 1825 by the *Enterprise*, commanded by Captain Johnson, who received ten thousand pounds for making the passage.

Each year saw steam-navigation extended, and improvements of more or less importance effected in connection therewith, attention being given to augmenting the power of the engines employed, and so increasing the rate of ocean-travelling. Some idea of the rapidity with which these improvements were brought into practice may be gathered from the fact that, in June 1843, the *Colombia* performed the journey between Halifax and Liverpool in nine days and twenty hours; and the *Great Britain*—the original ocean screw-steamer—left the Mersey on July 26, 1845, and arrived at New York on August 10; and in May 1851, the *Pacific* crossed the Atlantic in nine days nineteen hours and twenty-five minutes. Whilst improvements were being carried out in connection with the engines, vessels were being increased in size, it being argued that the greater the ship the more scope would be allowed for her machinery, and as the increased bulk would not counterbalance the augmented power which the machinery would apply, the power would be beyond what was necessary to propel the additional weight, and it therefore would be a means of effecting a more rapid rate of progress through the water. But this argument received a rude blow by the failure of Brunel's colossal vessel in 1859, at which

period the average time occupied in bridging the Atlantic was from ten to eleven days. For some years the idea of increasing the size of vessels was abandoned, the main object being to augment speed, an aim which was greatly furthered by the introduction of steel for shipbuilding purposes, inasmuch as, weight for weight, steel is much stronger than iron—more than double; consequently, equal strength can be obtained with a far less weight of the former than of the latter. This difference in weight obviously caused a difference in displacement greatly in favour of steel, as vessels constructed of this material not sinking so deep in the water as those built of iron, the engines which propelled the latter would drive the former at a greater speed, weight for weight.

But though immense improvements in ocean-travelling have been made within the past quarter of a century, it is only during the past decade that the steam-propelled ship has become a 'greyhound,' the greyhound a floating town, and the dangers and discomforts of the sea reduced to a minimum. The strictly modern class of steamships, but little inferior in size to the *Great Eastern*, may be said to have begun with the *Arizona*, built in 1879, which, excepting Brunel's immense failure, was much larger than any merchant-vessel preceding her. Her proportion of engine-power to tonnage was so great that it was predicted that she would either blow up or shake herself to pieces. But she fulfilled none of the evil prophecies respecting her; on the contrary, she made the Atlantic passage in the fastest time then on record, attaining a speed of twenty and one-third statute miles per hour; and when, colliding with an iceberg, she sustained a hole in her bow so large that a barge was rowed in to take out the cargo, she steamed two hundred miles back to New York in perfect safety, her watertight compartments rendering her practically unsinkable. In the same year was launched the *Alaska*, which, in 1882, was the first vessel to perform the American voyage in seven days, and in consequence she was given the title of 'greyhound of the Atlantic.'

The demand for larger and more powerful ships continued; and in a few months the *Oregon* was rushing to the New World at a rate of twenty-two statute miles per hour—the highest speed which had ever been attained; but in 1884 this was eclipsed by the *Umbria*, whose rate of progress was twenty-three and a half miles per hour. Later on, the *City of Rome*, whose daily consumption of coal is two hundred and sixty tons, or the output of a colliery of average dimensions, made the homeward Atlantic passage in six days twenty-two hours and twenty-five minutes. But all previous records were broken in February of last year by the *Etruria* steaming from the Mersey to New York in six days and nineteen hours—a performance which she outdid in the following month, when she voyaged between New York and Queenstown in six days five hours and eighteen minutes. Rapid, however, as was this rate of travelling, it was put in the shade by the *Umbria*, which in May last reached New York from Queenstown in one hour and nineteen minutes less than was occupied by the *Etruria* on the same voyage in February; and in June she did the distance between Queenstown and New York in the unheard-of time of five

days and twenty-two hours. At present, this is much the 'best on record;' and the *Umbria* stands at the head of the Atlantic greyhounds, which reach their destinations with a regularity that would have been deemed impossible a few years ago, and which is only equalled by the locomotives on our railways. How long the *Umbria* will maintain the position she now occupies is a matter of uncertainty; for, looking at the vast strides which have, during the past twenty-five years, been made in steamboat travelling, reducing the Atlantic by one-half, there seems no reason why further improvements should not be effected, and the New World brought within half a week's distance of home.

To attain these extraordinarily high rates of speed demands an enormous consumption of coal; and for Indian, Australian, and other long journeys, the burning of this quantity of fuel would render the voyage an unprofitable one for the ship-owners; consequently, vessels of less steaming power than those engaged in the American trade are employed. Up to 1883, the fastest passage ever made for a long run was done by the *Stirling Castle*, which covered the distance between Hankow and London, with a heavy cargo of tea, in thirty-one days and ten hours including all detentions, and twenty-nine days and two hours' actual steaming-time. But magnificent as was this achievement, it was placed far in the background four years later by the *Ormuz*, which is a splendid example of the perfection to which ocean-going steamers have now been brought, embodying the fruits of all the progress which has been made within the last decade. This vessel, launched in 1887, was designed to make the journey from London to Australia in twenty-eight days; and though she did not on her first trip succeed in realising expectations, in July she traversed the twenty-two thousand five hundred miles of sea which lie between London and Adelaide in the unparalleled period of twenty-eight days and ten hours, thus exceeding the time in which her designers calculated she would make the passage by only ten hours. Looking at the fact that at the beginning of the century Australia was eight months' sail from our shores, and that the steamers now plying between these countries occupy something like six weeks in performing the journey, it seemed little short of marvellous that a vessel could be constructed which would cover the distance in two-thirds the usual time. But astonishing as was this feat, in the October following the same ship eclipsed herself, landing the mails in King George's Sound in a trifle under twenty-four days from London, which gave an average speed of eighteen and one-third statute miles per hour, a rate of progress only little inferior to that of the best American liners. To have built a vessel capable of performing such a task would have been impossible in the wood age, and as an example of the iron age it stands unrivalled.

Such are a few of the swiftest vessels of our mercantile marine, and such are some of the triumphs of modern shipbuilding, which during the past decade has made greater strides than were ever dreamed of. These wonderful ten years have witnessed the obtaining of greater safety by the introduction of water-tight compartments; and improved designs and more per-

fectly constructed machinery have done much, besides increasing the rate of speed, to enable steamships to outride storms which a quarter of a century ago would have very severely tested, if not sent to the bottom, the best vessel then afloat; in short, the ocean voyages of to-day, as compared with those of twenty years ago, have been robbed of one-half their terror by the ever busy hand of progress. The effect which those improvements have had upon ocean-commerce cannot be overrated. By bringing the most distant parts of the earth within a few weeks' travel of home, the shipping year has been lengthened fourfold, the world's trade has been proportionately increased, and new industries have been created. Progress in various branches is still being made; and when we contemplate the wondrous improvements in the shipping world which have taken place during the past few years, we are in astonishment led to ask ourselves: 'Can there be a limit to man's ingenuity and skill, or will still more rapid means of transit between foreign lands be devised, and the earth's commerce be revolutionised in the future, as it has been in the past?'

IN DANGER'S WAY: A TALE OF TWO HEROES.

CHAPTER IV.—THE STORM.

CAPTAIN SATCHELL, seated in his cabin one afternoon, was just meditating a quiet half-hour over his meerschaum pipe, when a quick step on the deck changed the current of his thoughts. Next moment there was a soft knock at his door, and in came Cora Norland. The captain laid down his pipe and jumped up to greet the girl with both hands outstretched.

Cora had been a special favourite ever since childhood with the captain. There was not a corner about the old deck unknown to her; it had been such a famous place for a game of hide-and-seek; and then Captain Satchell had told her wonderful tales of the sea in this snug cabin of his; and when worn out with listening to stories as well as with play, she had often fallen asleep upon the hard hair sofa, with the great, rough pea-jacket placed over her shoulders by the thoughtful mariner.

'Captain Satchell,' said the girl, casting an anxious look around her, 'can you spare a few minutes?'

The captain nodded. 'Why, I hardly know, Miss Cora, how to kill the time. I'm overjoyed to see you! We shan't begin taking in ballast till next week.'

'Then let me fill your pipe,' said Cora laughingly, 'as I used to try and do years ago.—Were you not contemplating a smoke, when I tapped at the door?'

The captain's face expressed approval. 'Ay, ay; so I was! Why, it is like old times, ain't it?'

When the pipe was filled and lighted, Cora said: 'I wanted to speak to you, Captain Satchell, about Max Von Roën.' Her voice trembled slightly as she mentioned his name. 'Did he tell you about Abel Honeywood's letter?'

'He did indeed. He seemed to know it, as I thought, almost by heart.'

Cora looked pensively through the little round

window—a glimpse of the sea was visible beyond the harbour. 'Do you think,' said she, without turning her head, 'that he has gone in search of that diamond?—Perhaps,' the girl hastened to add, with a quick glance at the captain—'perhaps you know if he has.'

The captain puffed nervously at his pipe. 'I know what I would do, Miss Cora, if I was a young man. I would try my hardest to find it—ay,' he added with emphasis, 'if the attempt cost me my life!'

The girl clasped her hands together in protestation.

'Why, what does the song say?' resumed the captain, growing still more emphatic: "'Only the brave deserve the fair!'"—Well, Miss Cora, let those who are brave enough get alongside that wreck—if the wreck can be found.—And if the girl's heart is free,' he concluded, with a meaning glance at Cora, 'it will be rightly bestowed on the man that brings that diamond ashore.'

'But'—and Cora looked careworn as she spoke—'if he is lost?'

'Drowned?' and the captain stroked his chin meditatively.

Cora nodded.

'Why, in that case, Miss Cora, the young woman, who shall be nameless, would have to love his memory, and'—

'I couldn't do that; it would kill me, Captain Satchell,' the girl declared with sudden impulse, 'if Max—if any one risked his life for me.—Won't you help me to prevent him—to prevent every one from making this search? It will only end in some disaster, and I shall be seriously to blame.'

The captain still stroked his chin.

'It was very selfish, very thoughtless of me,' Cora went on distressfully. 'I let them suppose—Stephen Walsh, and Max Von Roën too, I'm afraid—that whoever found the diamond would—would more than please me.—What shall I do? I have been dreaming all night long that the most dreadful fate has befallen both these men. Will you send some one to Shingle Point? I would give anything if you could go yourself—and put a stop to this foolish expedition.' As she spoke, tears came into the girl's eyes.

'Why, Miss Cora,' said the captain reassuringly, 'there is nothing to be distressed about. Do you suppose that if I was anxious about these young men—about my mate or Mr Walsh—that I should have spoken lightly about the matter? The brig *Cora* has sunk far out at sea, or gone to pieces among the rocks in the Channel. In either case, this diamond is beyond the reach of man, never mind how daring he may be. That's my opinion, Miss Cora.—But,' he hastened to add, 'I'll crowd all sail and steer for Shingle Point, if that is seriously your wish. What say you?'

The girl replied after a moment's silence: 'You'll think me very superstitious; but I've got a presentiment that some disaster will happen; and I should never know how to thank you enough, if you would go without a moment's delay.'

The captain was soon up on deck giving instructions to get a boat ready to convey him to Shingle Point. If a command had come direct from Mr Norland, instead of this modest request from

the ship-owner's daughter, he could not have been more active.

Cora returned home along the sands with a lighter heart. The two boats racing over the moonlit sea on the previous evening had begun to alarm her. In her woman's brain, she conjured up every conceivable mishap which might befall the two men. Could she hide from herself that she was loved? But which of them loved her truly? Stephen Walsh had asked her to be his wife; but had not Max Von Rönin long ago betrayed his passion in every look and action, though he had never spoken one word of love to her?

The bar-parlour of the *Six Bells* at Shingle Point was crowded with sailors. It was a wet, gusty night, threatening a gale; and those who had contemplated putting to sea in their fishing-smacks an hour or two ago, had abandoned their project; for the dull appearance of the sky towards the south-west, confirming the storm-signals off the Point, predicted foul weather in the Channel.

The rough wind and heavy rain beat against the windows. But the talk and laughter were loud. No one heeded; not even the thunder, which sounded almost incessantly overhead, attracted any comment. These sailors were accustomed to storms; the thunder was no more than a familiar voice, and the lightning alarmed them about as much as the flash of an angry eye. Such things in nature, 'vaunt-couriers to oak-cleaving thunderbolts,' formed part of their every-day experience.

Captain Satchell, just landed from Southsea Bay, came in with the rain and salt water dripping from his oilskin cap and overall, and looked keenly round him. 'Max Von Rönin not here?'

There was a dead silence. Every one looked towards the mariner and remarked his anxious face. Max Von Rönin was not among them.

'If he's out in this storm,' said the captain, 'he'll never sight land again. No boat like his—few bigger craft could live in such a sea. I've only escaped myself by a miracle. What's become of the lad? Any one know?'

'Gone diamond-fishing,' said a stalwart seaman with a big deep voice. 'The notion took him, as I understand, that Honywood left some in his locker.—Ha, ha! I always thought that young Dutchman was a bit daft.'

Captain Satchell shook his head. 'He's sane enough; but a bit too venturesome.—You haven't seen Mr Walsh's yacht cruising about?'

No one had seen her since yesterday morning.

The captain looked dejected. He was on the point of removing his oilskin, with thoughts of a pipe and a glass of grog, after his rough sail from Southsea Bay, when the sound of excited voices at the outer door of the *Six Bells* arrested his attention. With renewed fears concerning the safety of Max Von Rönin—fears which would never have entered his head but for Cora Norland—he hurried out into the bar. The front door was wide open; the wind and rain were beating into the passage over the heads of an excited crowd; and beyond this crowd, a number of people were running past the inn towards the shore; and Captain Satchell quickly learnt that some craft—no one agreed in the

description—was tossing about in a dismantled state within a few yards of the beach.

Calling upon the sailors who had filled the bar-parlour a moment before to follow him and assist in the rescue, the captain made his way out into the night; and he was at once recognised as the leader by a number of brave seamen who instantly answered to his appeal.

The wind was blowing a gale; and the roar of the sea along the coast was a deafening sound: the shingly beach trembled with the crushing weight of breakers. Each moment, the lightning disclosed leaping crests of foam; and it now revealed a boat capsized, and a form, between it and the shore, clinging grimly to a spar or broken oar. Cries of dismay rose from the crowd—cries that were smothered by peals of thunder and the crash of huge waves. The brave old mariner, threescore years of age, shouted out that a rope be fastened round his waist. He had thrown off his oilskin and pea-jacket and stood ready to go to the aid of the drowning man. He was a famous swimmer; he was known to have saved many a life in his time. But a sailor stepped from the crowd and seized the rope. 'Stand by!' It was the big deep voice of the seaman who had spoken laughingly in the bar-parlour about Max Von Rönin. 'Fasten the rope round me.'

So frequent now and so vivid is the play of lightning over the sea, so pitch-dark the intervals of night—a sombre curtain that rises and descends—that the scene is like a series of instantaneous tableaux vivants. A flash, a quiver of dazzling brightness, and the brave sailor is seen bending with head to seaward, and over him a high-crested wave: the wave falls—is heard to fall—in darkness. Another flash; the drowning man is still clinging to the spar, and the sailor's arm is uplifted to clutch him. In each flash that follows the figures are confused; sometimes the spar is driven or hauled forward, sometimes falls away from the beach; but at last two bodies have been cast ashore: they lie there motionless: and then they are borne from the sea in the midst of a concourse of hurrying forms.

FRENCH PENNIES.

THE face of the French penny, which until recently was so familiar in many parts of this country, has disappeared from amongst us, never more, probably, to return. It would be a difficult matter to trace with any certainty the origin and growth of the ready circulation which the bronze coinage of other countries had found here, to the consequent displacement of our own bronze coinage; but it seems not at all unlikely that the ever increasing facilities for intercourse with our continental neighbours, and more especially with France, tended materially to aid in the operation. Some have considered that the influx of bronze coins from abroad was due to a lack of bronze at our own Mint; but this the authorities strongly deny; and there does not, indeed, appear to have been much ground for such an opinion. It was recently found necessary to enlarge the Mint premises on Tower Hill, and during the process, some of the bronze coinage had to be manufactured at Birmingham; but as soon as the enlargement was completed, the authorities at the

Mint were able to do the work themselves, for which they now possess every facility. In the year 1885 the Mint earned a profit of thirty-four thousand eight hundred pounds in respect of this kind of work alone, which shows the quantity of bronze-work they can perform in a single year. At the present time, we learn that no bronze coin is being made, as there is no demand for it in the ordinary channels; and for such demand as there is, the Mint, it seems, is well provided.

Our own view, that the abundant means of intercourse between this country and the Continent led to the introduction and general circulation of foreign bronze coins amongst us, is strengthened somewhat by the fact that such coins were to be found in large quantities at those seaport towns on the southern and south-eastern coast which are in direct communication with the Continent; and this, too, seems only natural, as travellers returning home from their continental tours would always be anxious to get rid as soon as possible of the surplussage of foreign coins with which their travels had left them burdened. In such places as Dover and Folkestone, it was common, indeed, for the silver as well as bronze coinage to pass almost as current as the coin of the realm. The vast quantity of bronze coin which latterly accumulated here can hardly, however, be accounted for in the manner indicated.

It has been computed that as much as a third part of all the bronze coins in circulation was at one time of foreign origin; while another estimate has given the value of such foreign money at one hundred thousand pounds. By the light of subsequent events, however, these estimates appear a little wide of the mark, and it may be that they were based upon the assumption that the large quantity of foreign bronze which circulated in London formed a fair index of what was the case throughout the whole country. The basis was a wrong one, however; for while it is quite certain that neither in Scotland nor in Ireland did the bronze coins from abroad find any favour, it is also the fact that they did not penetrate very far north into England. The quantity of foreign bronze which flooded the southern parts of England was, however, of itself enough, and so enormous as to suggest the existence of a systematic importation into this country for the sake of the small profit accruing on the transaction. Of this, indeed, there could be little doubt; and the circumstance soon attracted the attention of the Master of the Mint, who is also Chancellor of the Exchequer, with the result that for the purpose of making provision against practices of this kind, a special clause was inserted in the Customs Amendment Act of 1886, giving power to Her Majesty to issue a proclamation prohibiting the importation of any foreign coin. In the exercise of this power, a royal proclamation was issued on the 24th March last, prohibiting the importation into the United Kingdom of 'all coins coined in any foreign country other than gold or silver coins;' and by this step no further systematic importation of foreign coins resembling pence or halfpence is apprehended by the authorities.

The first result of the proclamation was one which the government had hardly foreseen, for, although the ukase was directed against the wholesale importation of foreign bronze, and, as

was subsequently explained, not against its circulation, the fact that such coins had been proclaimed, and would not be accepted at any of the government offices, was sufficient to create a scare in the minds of the public. In short, the circulation of foreign bronze coins became suddenly arrested, and for the moment the coins were practically valueless to their possessors. Tradesmen and others in business declined flatly to receive such coins in payment for goods; and the public soon became alive to the necessity of carefully scanning their change, to avoid having any of the proclaimed stuff foisted on them. All this, of course, told very hardly on the poorer classes, and all the signs of a panic were fast assuming form. Fortunately, the government readily recognised the importance of the situation, and, seeing that the proclamation had given rise to a general unwillingness on the part of the public to receive the foreign bronze coins in circulation, speedily made arrangements, in pursuance of an announcement made in the House of Commons on the 14th of April, for their receipt in exchange for cash or stamps, from the 18th of April to the 31st of May, at any post-office in the United Kingdom, at the rate of thirteen ten-centime pieces, or twenty-six five-centime pieces, to the shilling, no less quantity than sixpence-worth being received. This step had the desired effect of restoring public confidence; and, as was to be expected, the foreign coins poured into the post-office in huge numbers.

The period during which the public were permitted to tender their French pennies, &c. at the various post-offices was, as can be imagined, an exceedingly busy one at the chief offices in London; for the coins came rolling in day after day in ton loads; and as soon as they were received, they had to be counted, weighed, tied up in sacks, and conveyed to the royal Mint. This caused a great addition to the work of the cash branch of the Post-office, and although there were no actual all-night sittings, yet late hours were freely indulged in during the period referred to. Curious and interesting, too, were many of the coins that were sent up; and many persons, we believe, in ignorance embraced the opportunity of disposing of bronze coins for which at any time they might have received a higher value from a coin-dealer. Bronze coins of all countries and various dates flowed in; and the Post-office, interpreting its instructions in the most liberal spirit, accepted them all. Even defaced coins, and many such there were too, chiefly defaced with the advertisements of enterprising firms, were not rejected. The term of grace, as it may be styled, expired on the 31st May; and, as need hardly perhaps be said, the great rush of foreign bronze holders to the Post-offices took place at the beginning of the period. But in every circumstance of life there are people to be found who are always too late, and the present case was no exception, for applications continued to come in for some little time after the 31st of May for permission to exchange foreign bronze, which appear in each case to have been granted; and it was thus not until about the middle of June that the labours of the Post-office in regard to the foreign bronze coinage came to an end.

At the Mint, as well as at the Post-office, the measure adopted by the government for ridding

the country of the foreign bronze coins in circulation gave rise to a considerable increase of work, although, probably, not to so great an extent as at the latter-named department; for, so far as we can gather, it has not yet been finally decided in what manner the coins received shall be disposed of. They may either be returned in bulk to the countries whence they originally came, or they may be melted down at the Mint and manufactured into current coins of the realm. There would probably, it seems, be a slight loss to the country if the latter course were adopted; but notwithstanding this, we believe that the decision of the government is, for several reasons, likely to be in favour of it. As showing how much foreign bronze coin was in circulation here at the time that the government took steps in the matter, and also as affording some idea of the work performed both at the Post-office and the Royal Mint in connection with it, we may mention that the quantity of such coin now lying at the Mint is something like fifty tons in weight, and twenty-one thousand two hundred pounds in value.

In conclusion, it but remains to add that, as in illustration of the old adage, that it's an ill wind which profits nobody, if the proclamation against the wholesale importation of foreign bronze coin at first bore hardly on the poorer classes, it certainly proved a source of profit to the owners of those automatic machines which are rapidly becoming so popular in this country. After the proclamation referred to, and before the government decided upon allowing a term of grace, people possessing French pennies and other foreign bronze coins eagerly availed themselves of this ready manner of disposing of their foreign coins. The foreign bronze question was certainly not without its amusing aspect, when we remember how at that time the public suddenly displayed a predilection for chocolate, butter-scotch, cigarettes, and other such-like cheap luxuries, which otherwise they might no doubt have denied themselves. Just then, indeed, there seemed to be a mania for buying postcards, toffee, chocolate, matches, or trying one's weight—all which was to be had of these machines by dropping the inevitable penny into the slit. To the observant, of course the reason was obvious; and one firm alone, we are told, benefited by this suddenly developed mania by taking three hundred pounds-worth more in French pennies in a week than they would have done had these once familiar coins not been proclaimed in this country.

AN EXECUTIONER'S SWORD.

FOUR years ago I spent a winter in a city in the south of Germany, where I made the acquaintance of an antiquary who was very old and bedridden, and had no relations, no one to care for him but an old housekeeper. The man had belonged to the town-council, and had spent his life in collecting curiosities connected with the history of his town. Among his treasures, above his bed was the city executioner's sword, much notched. This sword was six feet long, with a huge handle, to be grasped with two hands, and with an iron ornamented knob as counterpoise at the end of the handle.

How life is made up of lost opportunities! How much of the criminal history of the city

might I not have learned, if I had paid longer visits to Herr Schreiber, and listened to his account of the notches in the blade, to each of which a ghastly history attached. But the antiquary's bedroom measured fifteen feet by seven, and the window was hermetically sealed; moreover, there was a stove in the room, and—Herr Schreiber himself always.

'Ach, mein Herr! do you see dis great piece broken out of de blade? Dat was caused by a voman's neck. De executioner could not cut it drough; her neck vas harder dan his sword. She vas a very vicked voman: she poisoned her fader.—Do you see dis littel nick? Dis vas made by a great trater to the Emperor and Vaterland. I vill tell you all about it.'

But I never heard all the stories: I should have been suffocated had I stayed to listen; but I found, whenever I called on my friend, that my eyes invariably turned to the sword—it was so huge, it was so notched, and had such a gruesome history. Poor old Schreiber, I knew, would have to bow his neck before long under the scythe of Time. How he hung on in that stuffy room under the great sword so long was a marvel to me, and would be pronounced impossible by sanitary authorities in England. Nevertheless, he did live on for a twelvemonth after I left the town. When about to depart, I said to the English chaplain: 'Old Schreiber can't last long; he must smother shortly. Keep an eye on the sword for me, there's a good fellow. He has left everything to the housekeeper.'

A twelvemonth after, as I was about to leave England for a run into Bohemia, I got a letter from the chaplain: 'Schreiber is dead. I have the sword.' I wired at once to him: 'Send it me to my inn at Aix-la-Chapelle. Will pick it up on my way home.'

So I went on my way rejoicing, ascended the Rhine to Mainz, trained to Nuremberg, and passed through the gap of the Bohemian mountain-chain to Pilsen, and on to Prague, where I spent a week, and where, by the way, I cut these two advertisements from a newspaper: 'A literary lady would like to meet a literary gentleman with a view to matrimony. Prose preferred, as the lady is a poetess, and contrasts generally harmonise best—matrimonially.' The other: 'Two young German officers, feeling lonely, desire to make the acquaintance of two young ladies of good education, pleasing manners, and good looks. Private fortunes a *sine quâ non*. Matrimonial views not excluded.'

Prague, in fact, forms two hostile camps—the Czechs and the German Austrians. They have separate theatres, separate cafés, separate newspapers, and deal at shops of their separate nationalities. If they could, they would decompose the atmosphere into its constituent gases, and the Germans inhale the oxygen, and the Czechs the nitrogen—which would perhaps be the best solution of the difficulty.

But to return to my sword. After six weeks in Bohemia and Silesia, I descended the Rhine to Aix-la-Chapelle, and arrived at my inn.

'Dere is vun vunderful chest come for you,' said the landlord. 'Ve vas not very comfortable to take him in. Ve keep him, dough.'

And no wonder. The chest was shaped somewhat like the coffin of a very tall man.

'Vat ish he? He have been here four week and doe days.—Dere is no schmell.'

'I cannot take that thing—I really cannot. It is preposterous. How could the chaplain have put my sword into the hands of an undertaker?—Get me a hammer; I will knock the case to pieces.'

Now, there was a reason why the chest should assume the shape of a coffin—that was, because of the crosspiece between the handle and the blade. My name and address were on the lid at the place where usually goes the so-called 'breast-plate.'

The host of my inn, the waiters, the porter, the boots, all stood in breathless curiosity to see the box opened, and when the sword was exposed—'Ach!' exclaimed the host gravely, 'I vas right—dere vas no schmell, because dere could be no schmell.'

I could not see the force of this reasoning, remembering Herr Schreiber's room, and how long the sword had been in it; and allowing that there is no porosity in tempered steel, still, the black velvet casing of the handle might have absorbed a considerable amount of Schreiberian bacteria, bacilli, or whatever it is that physiologists assert to be so nasty and so ubiquitous, and so set on finding out our weak places and hitting us there, as swordfish 'go' at whales.

I had got my sword out of its coffin, but had not considered what to do with it next, and I found myself in as great a difficulty as before. I got a porter to convey it for me to the station, and he placed it in the first-class waiting-room with the iron counterpoise on the floor, beside a divan, and leaned the tip of the blade against the wall. There it was allowed to remain; and I walked about, pretending that it did not belong to me. Presently, a well-dressed, very stately lady—she was a *Gräfin* (countess)—came in, stalked to the divan, and seated herself on it, very upright, without observing the sword. She opened a reticule and produced a lace-edged handkerchief, with which she proceeded to dust the velvet of her dress, and in so doing, with the end of her delicately shod foot, touched the counterpoise. At once the sword-blade began to grate against the wall. She looked up suddenly, saw the huge notched executioner's sword descending upon her bowed neck, uttered a little scream, sprang to her feet and ran, fleet as a rabbit, across the waiting-room; whilst down its full length after her with a clang fell the weapon—followed by a burst of laughter from every one in the room but the countess.

After this, I took the sword up and marched on the platform with it at my side. This I will say for it—that, considering its size and weight, it is easily carried; for not only is there the crosspiece as hand-guard, but above this is a crescent worked in the iron, the horns extending with the convexity towards the point of the blade. By putting a couple of fingers under these horns, the sword is carried at the side, pommel downwards, blade up, with perfect ease, the balance is so true. Some difficulty attended the getting into the carriage with the sword; I had to enter backwards and bring my sword in after me, passengers keeping judiciously out of its reach till it was safely brought within.

Not the Douvres-Calais that day! only that

horrible little narrow boat that always upsets me—and I—such an heroic being, bearing the mighty medieval sword, an object of wonder and questioning to sailors, *douaniers*, passengers alike. As it happened, I was the sole individual on board whose inner organs had not their sea-legs on this occasion. I lay on a bench upon deck, hugging my executioner's sword, and faintly calling: 'A basin, please.' Two ruffians—I can call them nothing else—paced the deck, smoking, and passed me every forty seconds. If there is a thing which tumbles a human being of a highly-strung nervous temperament over when he feels squeamish, it is the occasional whiff of a cigar. Then, added to the occasional whiff, were occasional catches of derogatory remarks, which came home to me as unpleasantly as did the tobacco: 'A chap with a sword like that should live up to it, and not grovel over a basin.'—And a quotation from the Burial of Sir John Moore: 'He lay like a warrior taking his rest.'

My spine, with the pitching and vibration of the vessel, felt not like a spinal column, but like a loose string of beads. If by swallowing the sword I could have acquired stamina, I should have tried it; but I did not think I could keep it down. At length, with a pasty face, bleary-eyes, liver-coloured lips, a battered hat, a dripping and torn waterproof, reeling, holding my ticket in my teeth, the sword in one hand and my portmanteau in the other, looking like a dynamitard every inch, and at once pounced on and overhauled by the police and customs-officers, I staggered ashore. Having that sword was as much as proclaiming that I had infernal machines about me somewhere, and even my pockets were not sacred. Having turned out all my insides at sea, I had to turn out my exterior pockets and portmanteaus now. It was monstrous. That was not all. I am sure a detective followed me to town. When I got into a hansom at Charing Cross, the sword would go nowhere except between my knees, with the blade shooting up between the reins of the driver high above the top of the conveyance. I caused great amusement as I drove through the streets of London thus.

The sword is at rest now, lodged on my staircase, and of one thing I am sure: no one is likely to run away with it. I have lost curiosities, too tempting for specialists to keep their fingers from; but no one will carry away my sword. I shall go, but the sword will remain.

SOME BURMESE SUPERSTITIONS.

WHAT on earth has happened in the village? I put this question to myself, for want of any one else to speak to, as I scramble hastily from under the mosquito curtain about two o'clock one morning, and go to the veranda to see what has prompted the peaceable inhabitants of Setgone to raise such an appalling din at this hour of all the twenty-four. The compound of my bungalow is skirted by the village, but it is far too dark to make out what has given rise to the uproar which has brought me out of bed; so I dress hurriedly, speculating on the probable cause. Either a universal free fight is in progress, or the villagers by common consent have selected

this unseemly hour to execute general repairs to their household cooking-pots. These are the only two possibilities that suggest themselves to my half-awakened faculties, and the sight that greets my eyes when I reach the one street the village consists of, does not help me in arriving at a solution. Every house is lighted up with tin and earthenware lamps, and every man, woman, and child is actively engaged in the apparently purposeless occupation of making the greatest possible noise with the most efficient available means. Gongs, pots, huge wooden clappers, drums, trumpets, and other unmusical instruments, are in full chorus. Every one is striving to drown his neighbour's contribution to the general din, and players whose instruments do not demand the aid of their lungs, exert those organs with much diligence in the utterance of fearful and blood-curdling howls.

A large number of the male residents have climbed to the roofs of their houses, presumably to make their share of the noise as widely audible as they can; and every one is so completely absorbed in the pursuit, that I walk half-way through the village without meeting any one capable of answering a question. At length a capering figure reels up against me as it dances backwards across the raised pathway in the middle of the street. It is armed with a large oblong drum, and is hammering thereon a spirited bass accompaniment to a tempest of shrill screams. The musician pauses suddenly as I stop, and, to my surprise, reveals the features of the meek little copying clerk who, in the office, sits all day on his stool as quietly as a mouse.

'What is all this row about, Shway Pho?' I ask without ceremony.

Shway Pho looks sheepish, and stares at his drum, as though he contemplated seeking refuge from my curiosity inside it. Then he grins faintly. 'The Burmese people think this noise is good to drive away the *kala nah* [cholera], sir.'

'Oh, has any one in Setgone got cholera?'

'All right now, sir—they are dead,' is the glib but startling reply.

He means of course that every one else is 'all right'; but Shway Pho's limited knowledge of English often makes his expressions a trifle ambiguous. Further queries elicit the information that a boatman named Moun Lan, his wife Mah Khin, and a little boy of Moun Wah's, have all succumbed to this disease, so inevitably fatal to the native it attacks.

'Where is Moun Than?' I ask, naming another clerk, whose steadiness and good conduct I frequently hold up to his juniors by way of example. 'What is Moun Than doing to-night?'

Shway Pho explodes in rapturous giggles, and points with careful exactness to a spot on a neighbouring roof, whereon the decorous, the sedate Moun Than is seated, devoting all his energies to the flagellation of a huge iron pot with a bamboo. Shway Pho's malicious delight at being able to exhibit his senior in this undignified position is intense. He has, like most of his race, a keen sense of the ridiculous, and is greatly tickled by my undisguised astonishment at finding the 'model clerk' where he is.

The English-speaking Burman does not like to be caught joining in the superstitious doings

of his fellows, so, as Moun Than is too much absorbed in his business to notice me, I tell Shway Pho to call him down, and continue my walk through the village. It is the same throughout. Every soul is engaged with all his might in the creation and maintenance of the most deafening and confusing din I have ever heard.

Presently, Moun Than joins me, breathless but respectful; and we walk on together to a patch of jungle beyond the village, where the uproar is tempered by distance, and it is possible to make one's voice heard without raising it to its highest pitch. You must always ask an educated Burman what 'they' are doing, when you refer to the employment in which he has been engaged with his more ignorant fellows. He is much more likely to be confidential if your mode of address implies that you consider him their superior. It appears from his report that the Setgone people are anxious about the cholera, for the Indian coolies whose lines are a few hundred yards from the village have lately had several fatal cases, and the three deaths amongst the Burmese had established something resembling a scare.

'But what good will all this noise do?' I ask in desperation.

Moun Than hoarsely explains. 'These people, sir, think that a bad spirit has caused this sickness; therefore, upon that account they must make much noise, that he may become frightened and run away.'

This was concise, and so far satisfactory; but the din was quite as brisk now as it was when it first disturbed me, and I rather anxiously asked how long it usually took to frighten such spirits.

'I cannot tell,' said my informant. 'But,' he considerably added, 'when the people are tired, they will stop.'

That was something to be thankful for, at all events; but they showed no signs of fatigue yet, and I made some remark of the kind to Moun Than.

'Soon they will be tired; but this noise must continue four or five nights, sir—until the *nat-soh* [evil spirit] is quite gone, sir.'

This was not reassuring to a man who worked hard all day and earned his rest at night; but there was still the consolation of knowing that if the 'nat-soh' resembled humanity so far as to possess ears, and owned as much sense of harmony as a pariah dog, it would not voluntarily stay long. It was inconceivable that any spirit could withstand such a terrible notice of eviction.

'Good-night, sir,' said Moun Than, beginning to move off in the direction of the village. 'I shall now go to my house to sleep, sir.'

I walked leisurely back after his retreating figure, and it crossed my mind that the clerk was in a violent hurry to get to bed. His haste was explained by his reappearance on his own roof *dekchee* and bamboo in hand, doing his best to compensate for lost time.

I returned to my bungalow, and presently the commotion began to die away; individual efforts became more and more apparent, shouting ceased, and at length silence once more reigned over Setgone.

Next morning discovered the villagers again busily engaged on their roofs, but this time to

repair the damage last night's orgies had caused. The frail thatches of *dhunny* and bamboo had suffered severely, being by no means equal to supporting the proprietors in their gambols thereon in a high state of excitement. Indeed, the general aspect of Setgone was so dilapidated as to suggest the recent passage of a cyclone.

I believe 'occupation of the mind and body' is warmly recommended as a means of fending off the ravages of an epidemic. How far the Burmese specific can be held to afford mental employment, I leave readers to decide for themselves, but even Burmese ingenuity could not devise a more cheerful and exhilarating means of bodily exercise, so perhaps their method of dealing with cholera is less foolish than it appears. Whether it was due to the energetic measures I have described, or to the immediate closing of a well whose water was found to be impure, I cannot say, but certain it is that for many months Setgone was free from disease. Closing the well was productive of much grumbling in the village, as being a troublesome display of British prejudice.

'If it was the water,' said the old headman in his impressive way, 'why did not we *all* get cholera?'

Being bad at riddles, I could not answer this simple question; and persisting in my refusal to reopen the well, incurred much odium from the villagers, who had now to walk fifty yards farther to obtain their daily supplies. I am afraid the Setgonians regard me still as a wicked impostor, who thus revenged himself upon them because he was kept awake for a few nights by their own wise precautions.

The poor Burman is sadly bothered by the number of *nats* who perpetually hover about him to bring misfortune and trouble upon his head; however, by dint of propitiatory offerings, and by studying the well-known idiosyncrasies of the more malignant spirits, so as to avoid wounding their susceptibilities, he gets along fairly well—much better than any Indian race. Besides, although strict Buddhists disapprove of his regard for the *nats'* feelings, it is generally acknowledged that the presence of a *phoongyee* (Buddhist priest) or other pious man is enough to render the bad spirits incapable of mischief. And as wearers of the yellow robe are to be found everywhere, the *nats* are less troublesome than might be expected. Indeed, if you go the right way to work, there are few ills and dangers of life that cannot be avoided in Burma. Some of the Wise Men have such marvellous powers, and are so willing to exercise them for a trifling consideration, that it is your own fault if you run unnecessary risks. I became *thaynat hpee* (gun-proof) myself for five rupees; and nothing but a foolish regard for appearances deterred me from having another potent charm tattooed in red spots round my neck by a celebrated *sayah* (teacher or professor), who kindly offered his services. I remained satisfied with my gun-charm, however, and by showing it accidentally in camp one night, heard some instructive particulars. Such a thing in a European's hands could not escape notice, and an old Burman near me at once begged permission to examine it. I gave it him with feigned hesitation, and with injunctions to be careful, allowed it to be handed round to all the men. The charm itself

was a tiny figure of Gaudama in a sitting attitude, carved in ivory, and not much exceeding a large pea in size. Under my directions, my Burmese servant had procured it from a *phoongyee*, as if for himself.

'Does your honour *always* wear it?' asked the man who had last examined the charm, and now returned it to me in both hands.

'I must always carry it in the jungle,' I gravely replied. 'Are you *thaynat hpee* yourself?'

'Yes, your honour.'

He readily assented when I asked to see his talisman, and produced from some remote corner of his clothing a very dirty bundle of rags as large as a racket ball, which swathed a little tin pill-box in half-a-dozen wrappings. The box contained a figure similar to mine, and was examined with reverence by the men round.

'Who gave you that?' I asked.

'The *phoongyee* near Thitboungyee. I paid six rupees for it.'

'And are you quite safe with that one?'

'It is the best. I can get other kinds for three rupees; but they are not good; I should want many of them.'

He was wandering from the point, so I brought him back to it. 'If I fire at you with my gun, would you be hurt?'

'Your honour's gun always goes off,' said the old man, rather resenting the prospect of facing a gun he had not seen miss fire once in a long day's duck-shooting.

'Well, then, what would happen if a dacoit fired at you? Would he miss you?'

'Oh, his gun would not go off,' was the reply in a tone of conviction.—'This is the *best* charm that can be got,' insisted the owner plaintively, again.

'His gun would burst,' put in a gray-haired Burman on the other side of the fire, in a sepulchral voice—'the dacoit's gun would certainly burst.'

I handed back the charm, and asked to see any others the men had with them. All had curious devices tattooed on various parts of the breast and shoulders, and the majority had more material charms inserted under the skin, where they formed smooth and unsightly lumps like huge warts. These the owners admitted had been acquired from *sayahs* of the occult arts, and consisted of magic spells inscribed upon scraps of ivory, silver, lead, and, in one case, gold. The more precious metal did not, however, confer greater immunity from danger than other substances, the value of such charms depending altogether upon the spells written on them.

'I should like to become *dah hpee*' (sword-proof), I said, after comparing notes on the value of the gun-charms.

'Oh, that is easy. Your honour must eat the medicine to become dah-proof,' said two or three at once; for all were now interested in the discussion, and were satisfied that my inquiries were bonâ fide.

'What is the medicine made of?' I asked.

'We cannot tell. The *phoongyee* can make and give it to your honour.'

'I must get some at once,' I continued; 'but I do not like to eat it.'

There was a slight laugh at this show of squeamishness on my part, and after a pause, a

young man suggested that I might place it in a little bag and wear it round my neck.

'It is not very good like that,' said the old man who had first seen my charm. 'His honour might be wounded if he did not eat the medicine.'

The speaker was evidently regarded as an authority on the subject, for the others murmured assent, and the young Burman did not press his proposition further.

The 'medicine,' carefully wrapped in leaves, was afterwards brought to me as a present by one of my jungle friends. It appeared to consist of dried leaves or bark finely powdered, and had the faint smell one might expect from such a substance. There was only sufficient to cover a rupee, but I was assured that the quantity was more than enough, if I would only eat it. To satisfy the thoughtful donor, I undertook to do so, but my Burmese servant considerably stole the precious compound that evening, and so spared me the ordeal.

The Burman's faith in these charms is very deep-rooted, and in spite of frequent and painful demonstrations of their fallibility, he does not seem to lose confidence in their magical properties. An excuse can readily be found for their failure to protect the holder, and even the injured man is the first to explain how it happened that his talisman did not fulfil his expectations.

The late Mr St Barbe, who was shot by dacoits, was credited with the possession of powerful charms against violent death, for which he was chiefly indebted to his great stature and personal strength. Long after his cruel death, I asked a native official, in the course of a conversation on such things, how he could account for the failure of Mr St Barbe's charms to preserve his life.

The man stooped towards me, and in an awe-struck whisper, asked: 'Did not his honour the Big Deputy-commissioner carry his man to the boat when he was wounded and could not walk?'

I assented. It was an act that would have gained a soldier the Victoria Cross.

'The blood from the shot-wound fell upon his honour; therefore, it was easy to kill him. His charm was no use after that.' The man drew back, and shaking his head, gravely repeated, 'After the blood from the wounded man touched his honour, it was no use—no use.'

'Then, if the blood from a bullet-wound touches a man who is *thaynat hpee*, his charm is spoiled?'

'Yes; it is spoiled. He must then get another one.'

'And is it the same with a charm against dah-wound?'

'Yes; it is the same.'

The man appeared quite satisfied that his statement was true, and was perfectly open in answering me. It would seem that the blood from a dah-wound would destroy a dah-charm, but not one against the gun, and vice versa. He was confident that his own talismans would withstand any reasonable test, but demurred strongly when I suggested a trial. It would be time to test their virtue when he met with dacoits, he said; and laughingly declined to continue discussing the subject with so earnest a seeker after magical truths as I appeared to be.

A book could readily be filled with an account of Burmese superstitions and magic theories; but I have contented myself with a reference to the two that come most frequently under the notice of Europeans in that country, and do not perhaps differ widely from the beliefs commonly held amongst other half-civilised races.

INDESTRUCTIBLE PAPER.

The rapid decay of paper from the attacks of insects and germs of decay, combined with the high price ruling for parchment, have resulted in an attempt to render common paper indestructible by special preparation in manufacture, care being taken that the antiseptic treatment shall not affect deleteriously the usefulness of the paper for writing or printing, or damage any particular shade or colour it may possess. To this end, a chemical compound, prepared by the distillation of coal-tar, and known under the name of Resorcin, is employed, in the proportion of one part by weight to two thousand parts by weight of rags, jute, straw, and the other materials usually utilised in paper manufacture. The resorcin is added either during the washing and cutting to which these ingredients are subjected prior to their reduction to pulp; or, if found more convenient, the admixture can be made directly with the pulp. The oil of the *Eucalyptus globulus*, better known as the blue gum-tree of Australia, is afterwards added, rendering the paper pleasanter both to touch and smell, and imparting to it a slight perfume. By such means, all fungi germs, of decay, &c., are destroyed on coming into contact with the paper, and the indestructibility of the material is insured.

SHE FORGOT HER WRONGS.

Yes, she forgot them!—Angry words
That cut the heart like sharpest swords;
Yes, she forgot them!—Unjust deeds,
The wrong that envy surely breeds
In meaner natures; but no stir
Of baser passions marred in her
The conquering power of purer thought,
Ever remembering Who had taught:
'Father, they know not what they do;
Forgive them!'—and she wished it so.
Wrongs, she forgot them, one by one,
Though never yet a kindness done.

A generous act, a kindly speech,
Would seem her very soul to reach,
And there remain a lasting thought
To be with happy memories fraught;
Unlike cold natures, proud and vain,
In gratitude she felt no pain,
But rather joy, which on her face
Its lines of light knew how to trace.
I wonder, did she long ago
Learn lessons of unfathomed woe,
That she forgets her wrongs alone,
But never once a kindness done!

No. 222.—VOL. V.

SATURDAY, MARCH 31, 1888.

PRICE 1½d.

CONCERNING ENCYCLOPÆDIAS.

WHAT a host of questions there are constantly cropping up in the course of one's ordinary reading, of one's every-day conversation. How does M. Pasteur treat his patients, and the Emperor of Russia his neighbours? What are socialism, crofters, blizzards, cantilevers, dynamitards, euchre, switch-back-railways, tobogganing, and theosophy? Who are Emin Bey, Daudet, Walt Whitman, Campion, Booth, Beckx, Begg, and Bubb Doddington? Where are Penjdeh, Baku, Battenberg, Saskatchewan, Angra Pequena? Who are the Basques, and whence did the gypsies come? When was boycotting invented, the phonograph, volapük, and the bowie knife? Who wrote the *Letters of Junius*, the *Imitatio*, or Shakespeare's plays?

From thirty learn thirty thousand. It is easy, indeed, asking questions. To answer them is not so easy, though the answer to nearly everything lies somewhere—in the columns of the *Times*, in this or that costly folio, in a consular blue-book, in the pages of a scientific journal. What, then; to solve every petty problem must one run up to London and ransack the book-shelves of the British Museum? Assuredly, some such a pilgrimage would often be our sole alternative to ignorance, were it not for the precious labours of a heathen Chineese and his fellow-encyclopædists.

In 1726, when Diderot and D'Alembert were boys at school, there was printed at Pekin the *K'in Ting Ku Kin tu' shu tsih Ch'eng*, or Complete Thesaurus of Writings Ancient and Modern, under the auspices of Kang Hi, the enlightened and scholarly Emperor of China. The fruit of forty years' labour, it filled no fewer than five thousand and twenty volumes, with maps, plans, and illustrative designs; but was restricted to a hundred copies, one of which found its way in 1878 to the British Museum Library.

One might plausibly pronounce this the first, as it is certainly the biggest, of encyclopædias. But during the seventeen centuries preceding its appearance, the 'foreign devils' of the West had

produced a score and more of kindred compilations. There was the *Historia Naturalis* of the Elder Pliny, who perished during the eruption of Vesuvius in 79 A.D. Its thirty-seven books treat of geography, zoology, medicine, magic, and half-a-dozen more branches of knowledge and ignorance. There was the *Speculum Majus* of Vincent de Beauvais, a Dominican friar who flourished about the middle of the thirteenth century, and who styled his work *Speculum* 'because it briefly contains almost everything he could collect from innumerable works that is worthy of speculation.' It is divided into more than ten thousand chapters, several of which, that, for instance, on Botany, are subdivided alphabetically—an approach to the modern encyclopædic arrangement. There was the *De Proprietatibus Rerum* (On the Properties of Things) of our own countryman, the Franciscan Bartholomew de Glanville. Written about 1360, this became exceedingly popular in its translation (1398) by the Cornishman John Trevisa, a translation of great linguistic interest, since in the early manuscripts and the various printed editions of it may be traced the gradual changes in the English tongue during the fifteenth and sixteenth centuries. Again, there was Johann Alsted's *Encyclopædia* (7 vols., Herborn, 1630), noteworthy as one of the first works bearing that title; but so broken up, like its predecessors, into books, according to subjects, that it is difficult, often impossible, to light on what one is wanting. Huge treatises are encyclopædic articles only in the sense that a ham and a quartern loaf are a potential packet of sandwiches. And finally there were the anonymous *Universal Historical, Geographical, Chronological, and Classical Dictionary* (2 vols., 1703), and Dr Harris's *Lexicon Technicum, or an Universal English Dictionary of Arts and Sciences* (1704). Themselves descendants of the foreign dictionaries and lexicons of Moreri, Hoffman, Bayle, and other seventeenth-century scholars, these two works may be deemed the first parents of all the subsequent race of English encyclopædias, cyclopædias of arts and sciences, and biographical dictionaries.

The earlier of them, the *Universal Dictionary*, has escaped the notice of all writers on the subject; indeed, Mr Lyons asserts positively that Harris's folio was 'the first alphabetical encyclopædia written in English.' Yet the Dictionary deserves not to be utterly forgotten, for it is full, concise, lively, and, all things considered, wonderfully accurate. This, though one smiles at its statement that 'the Arms of the Emperor of Japan are 3 *Trefoils Argent* in a *Field Sables*;' or at the vagueness of the following articles: 'Abraham, a Bishop who liv'd only upon Raw Herbs, yet entertain'd others Hospitably with good Victuals and Wine;' and 'Zareba, said to be a province of Arabia, of which, however, we could gain no exact information.' The use of 'em for them gives a quaint 'Harry Esmond' flavour to the style; and we cannot sufficiently admire the charity that concluded the article on James II. with this remark: 'Tho' he began to reign well enough, yet the remainder of his Government being blameworthy, I will draw a veil over the whole.'

At this point, our subject naturally branches into as many heads as a hydra's, and nearly as many as those of an old Scottish sermon. But we are not going to dwell on Ephraim Chambers's *Cyclopædia* (2 vols., 1728); on the epoch-making, revolution-causing *Encyclopédie* of D'Alembert and Diderot (35 vols., 1751-80); on the *Encyclopædia Britannica* (3 vols., 1768-71; 9th ed., vols. i.-xxiii., A—Ups, 1875-88); on Coleridge's *Encyclopædia Metropolitana* (28 vols., 1817-45); on Knight's *English Cyclopædia* (23 vols., 1854-62); on Chambers's *Encyclopædia* (10 vols., 1860-68; 2d ed., vol. i., 1888); or on Mr Leslie Stephen's *Dictionary of National Biography* (vols. i.-xiv., A—D, 1885-88). Instead, we propose to offer some desultory remarks on encyclopædias generally and on the methods of their manufacture.

Encyclopædias differ like stars in magnitude. They vary in price from three shillings to one hundred and fifty pounds; in weight from nine ounces to four hundredweights; in rate of development from a few months to more than a century; in value from minus to ∞ —hyper-excellence. Cost does not matter much, if only one is rich; nor ponderosity, if one is stout of arm; no, nor slowness of production, if one comes of a long-lived stock, or has children and grandchildren to inherit the early volumes. Under such conditions one might safely have invested in the *Encyclopédie Méthodique* (166 vols., 1782-1832), or even in the still vaster *Allgemeine Encyclopädie* of Ersch and Gruber, which, commenced in 1818, had reached in 1888 its 168th volume, and still is not nearly completed.

There is, however, one drawback to these monumental works: the ablest articles are apt in course of time to become obsolete, imperfect, absolutely wrong. This was true in the slow-coach days of our grandfathers; it is ten times more true in the present lightning age of change and progress. Glance back at the past ten years. Cyprus ten years ago was Turkish still; King Theebaw had not yet ascended the Burmese throne; the Prince Imperial and the Comte de Chambord were both possible candidates for the crown of France; Khartoum, ay and Gordon, were names little known to Englishmen; no bombardment had shattered the forts of Alexan-

dria; and Beaconsfield, Beecher, Borrow, Carlyle, Darwin, Doré, 'George Eliot,' Emerson, Fitzgerald, Gambetta, Garibaldi, Gortschakoff, President Grant, Victor Hugo, Lord Iddesleigh, Liszt, Longfellow, Pusey, Ranke, Charles Reade, Rossetti, Dean Stanley, Trollope, and Wagner were still alive.

Alive, but not therefore unknown?

Unknown at least to those encyclopædias and biographical dictionaries which take no account of the living, which require that a man must have died, if only a half-year before, to be worthy of a niche in their Valhalla. We do not ourselves believe that this rule was really dictated by a wish to exclude all matters of living interest. Rather its motive seems to be the fear that an article dealing with an unfinished career must itself of necessity be incomplete. Granted, it must; but so, too, must the bulk of the non-biographical articles. An article on any city or country, any branch of science or art, is seldom complete long after it has left its author's hands. Write an article to-day on Bulgaria; by the time it is printed and given to the world, the whole face of affairs may have altered; Bulgaria, indeed, may be wiped clean out of the map. Concerning the dead even one can never feel sure of having said the last word. Who could have written a faithful account of Bothwell before the appearance of his Life in Danish by Schiern? Or how can a really complete article be produced on Lord Beaconsfield so long as his diaries remain unpublished? To exclude Darwin, but admit the Darwinian theory; to describe Armstrong guns and the Bessemer process, but tell nothing about their inventors; to give sketches of German History and Tractarianism, but leave out Bismarck and Cardinal Newman—why, this is to work at a sum with half of the factors omitted.

There are hundreds, thousands, of other subjects demanding the same nice judgment on the editor's part, if he would shun the Scylla of omission, nor fall into the Charybdis of repetition. From four or five of the best and most recent works of general reference it were easy to frame a portentous list of omissions. Here are a few, culled at random: the Regents Murray and Morton, Sir Thomas Overbury, the dramatist Kyd, John Law and William Paterson, Philemon Holland, John Hales, North (Plutarch's translator), Prynne, Davoust, Gunpowder Plot (the Gowrie Conspiracy in the same work gets thirty-eight lines), the Peninsular and Crimean Wars (the Thirty and Seven Years' Wars have each an article), Ascidian, Juggernaut, Mica, Coquimbo, Dettingen, Maelstrom, Mont Cenis, Capes Cod and Horn, Magdalena. On the other hand, you sometimes find the same facts stated twice or thrice over in the very same work under such different headings as Boxing and Pugilism, Russia and Peter the Great, Catholic Emancipation and Roman Catholic Emancipation, British Navy and Navy (British), Borough and Municipality, Beating the Bounds and Perambulation of Parishes, Annates and First-fruits, and Banner, Colours, Crescent, Eagle, Ensign, Flag, Oriflamme, Pennant, Pennon, Signals, Standard, Tricolour, and Union Jack.

Certain it is that there must be some amount of repetition, though it can be greatly minimised by means of skilful cross-references; certain, too,

that no work can aim at telling everything, even though it does claim to be a 'dictionary of universal information.' All information is not valuable. That imparted by Mr F.'s aunt in *Little Dorrit* was decidedly worthless; so was that demanded of Water-baby Tom by the Turnip: 'Can you tell me the name of a place that nobody ever heard of, where nothing ever happened, in a country not yet discovered?' The *Perfect Encyclopædia* (Utopiæ, anno Millennium) will aim, of course, at absolute utility—will tell everything that may be reasonably wanted about everything likely to be ever looked for, tell it with the utmost conciseness consistent with clearness and good literary style.

Yes, utilitarianism—'the greatest happiness of the greatest number'—must ever be the editor's first principle. If nine hundred and ninety-nine readers will turn to the article Shakespeare, and one only—he doubtfully—to that on Sir Richard Blackmore, then Shakespeare, in racing parlance, is clearly first favourite, and Sir Richard a rank outsider. Still, the wise editor will, like his brother bookmaker, not overlook the outsiders; he will simply adjust his book to public opinion, and give Shakespeare, it may be, four pages, Sir Richard scarce fourteen lines.

Ah! but he'll have to reckon with his contributors. Bring together the Dodo specialist and the high-priest of Browning, and leave them to settle the relative length of their articles. Their end shall be that of the monkey and the parrot, whose mistress one evening left them alone in her bedroom. Returning five hours later, she heard a lamentable voice proclaiming, 'We have had a night of it;' and behold! Master Pug lay sightless on the bed, both eyeballs gouged out by the parrot, who himself drooped naked on the towel-rail, plucked cleaner than ever was medical.

Only readers may be gentle; the editor must be stern, inflexible. Let him be weak, and the articles on Unknown Tongues shall exceed those on French and Italian. But, indeed, there is a class of contributors with whom there is no doing anything till a score or so have been hanged for an example. There is your great authority on Suffolk—a Nimrod he, two-thirds of whose article is devoted to an *excursus* on fox-hunting, to an account of some memorable run in which thirty-three hounds were killed by a passing express. (This one knows to be a lie, for in East Anglia there are no expresses.) There is your nautical contributor. You ask him for four pages on the Navy; instead, he sends you nine on the Armada, which has long since received its allotted quota. There is the titled authoress, who begs leave so prettily to furnish a 'tiny notice' of the historic castle of her ancestors. Tippoo's sword is preserved there, and on that slender peg she hangs three whole columns of Indian history. There is the contributor who does good work so slowly, that you have to drag it from him piecemeal, if indeed you can get it at all. And there is the contributor who does bad work very rapidly, who composes by decomposing, and refurbishes stolen articles with different language—the more indifferent the less chance of his detection. (For him, see the third act of Mr Byron's *Our Boys*.) There are many others. Like the mouse's in *Alice*, the editor's tale is not seldom a long and a sad one.

We have had encyclopædias for the erudite, encyclopædias for the common-sensible; why not a *Lunatics' Encyclopædia*? It might prove a brilliant hit, as supplying a long-felt want, might even satisfy the never satisfied. It of course would put everything just where no sane being would dream of looking for it—Wood-engraving at Xylography, Roumania at Vlachia, Music at Schools of Musicians, Chad at Ceadda, Stonehenge and Avebury at Ancient Monuments, Earthquakes at Seismology, Cope and Chasuble at Overcoats, Bothwell at Hepburn, and so forth. (Only, the editor would have to be careful that he was not infringing a copyright.) It would lengthen everything that should be short, and shorten everything that might be long, giving an equal space to Keats, and Tannahill, and Robert Pollok; as much to Gilfillan as to Brantôme and Robert Burton together; twice as much to 'Monk' Lewis as to 'George Eliot;' and far less to Shakespeare than to Pope or Dryden. (Though here, too, it were hard to be original.) Then, to avoid monotony, it should give as many conflicting accounts of everything as possible; assign every event to at least two different dates; and adapt freely, daringly, from foreign authorities. (Varsovie and Warsaw, St Johnstone's and Perth, Regensburg and Ratisbon, figure well side by side in one article; and in describing an Italian town it looks so idiomatic to speak of the *Domplatz*, or of a Spanish townhall as an *hôtel-de-ville*.) Lastly, the *Lunatics' Encyclopædia* should revel in misprints and solecisms. So, by dint of the rarest ingenuity, it might furnish a collection of glorious *errata*, whose obscurity should outdim even such gems as these:

'The pretty little town of Biggar, with majestic *tints* looming in the distance.'—Perhaps Tinto Hill was intended.

'In the Middle Ages Göttingen was invested by the Moors.'—*Umgeben mit Mauern* might by some be rendered, 'surrounded with walls.'

'The spike used for spiking a gun is twenty-seven inches in diameter.'—This seems large.

'The animal kingdom of Austria embraces wild boars, foxes, jackals (!), otters,' &c.

'The countess was summoned in December 1683 to decipher them. She, *however*, replied that she had burnt the only key she had. Both she and Lorne, *however*, admitted that they were in Argyle's writing. The cipher was, *however*, at length read by Spence.'—This, *however*, is by no means the first or the last *however* in the article.

'The boy [Jean Jacques Rousseau] educated himself with the novels of Samuel Richardson.'—As the first of these appeared in 1740, and Jean Jacques was born in 1712, he must have been rather an old boy.

'A lacustrine expanse encinctured with silvan ornament.'—This is how a very good gazetteer has translated 'a lake surrounded with trees.'

'In 1696, William Prince of Orange built the new castle of Breda. It was afterwards the residence of Charles II. in his exile.'

'In 1529, John Caius was admitted a student of Gonville Hall at Cambridge, where, owing to the successive labours of Erasmus, Sir John Cheke, and Sir Thomas Smith, the new learning was being cultivated with great success.'—In 1529, Cheke was just fifteen years old.

'He died at Schlagfluss, 13th October 1823.'—*Schlagfluss* in German means 'apoplexy'—an odd name, even for a German place. We should read, 'He died of apoplexy.'

'When Kossuth, the Hungarian leader, landed in England, after having been rescued by Palmerston from the demands made for his surrender, he proposed to receive this personage at Broadlands.'—One would hardly guess that 'he' stands for Palmerston, and 'this personage' for Kossuth.

'The chief occupation of the natives of Mecca is the weaving of *chaplets of roses* for the pious pilgrims.'—Precisely, *Rosenkränze*. But it might mean 'rosaries.'

'The Banda Islands have an area of about 7150 square miles.'—'About' is a vague word; still, 'Behm and Wagner' gives the area as seventeen English square miles.

'Sydney Smith, born in 1771 . . . in 1780 was elected a scholar of New College, Oxford.'

'The present town charter of Hawick was confirmed in 1545 by Queen Mary during a residence in the town.'—She being then two years old.

'Idiotic mistakes,' says the reader. But, pray, dear reader, did you ever write for, or, worse still, edit, an encyclopædia?

THIS MORTAL COIL.

CHAPTER XV.—THE PLAN EXTENDS ITSELF.

FOR three or four days, Elsie lay at the Relfs' lodgings at Lowestoft, seriously ill, but slowly improving; and all the time, Mrs Relf and Edie watched over her tenderly with unceasing solicitude, as though she had been their own daughter and sister. Elsie's heart was torn every moment by a devouring desire to know what Hugh had done, what Hugh was doing, what they had all said and thought about her at Whitestrاند. She never said so directly to the Relfs, of course; she couldn't bring herself yet to speak of it to anybody; but Edie perceived it intuitively from her silence and her words; and after a time, she mentioned the matter in sisterly confidence to her brother Warren. They had both looked in the local papers for some account of the accident—if accident it were—and saw, to their surprise, that no note was taken anywhere of Elsie's sudden disappearance. This was curious, not to say ominous; for in most English country villages a young lady cannot vanish into space on a summer evening, especially by flinging herself bodily into the sea—as Warren Relf did not doubt for a second Elsie had done in the momentary desperation of a terrible awakening—without exciting some sort of local curiosity as to where she has gone or what has become of the body. We cannot emulate the calm social atmosphere of the Bagdad of the Califs, where a mysterious disappearance on an enchanted carpet aroused but the faintest and most languid passing interest in the breasts of the bystanders. With us, the enchanted carpet explanation has fallen out of date, and mysterious disappearances, however remarkable, form a subject rather of prosaic and prying inquiry on the part of those commonplace and unromantic myrmidons, the county constabulary. This strange absence of any allusion in the Whitestrاند news to what must needs have formed a nine days' wonder in the quiet little village, quickened all Warren Relf's profoundest suspicions as to Hugh's procedure. At Whitestrاند, all they could possibly know was that Miss Challoner was missing—perhaps even that Miss Challoner had drowned herself. Why should it all be so unaccountably burked, so strangely hushed up in the local newspapers? Why should no report be divulged anywhere? Why should nobody even hint in the *Lowestoft Times* or the *Ipswich Chronicle* that a young lady, of considerable personal attractions, was unaccountably missing from the family of a well-known Suffolk landowner?

Already on the very day after his return to Lowestoft, Warren Relf had hastily telegraphed to Hugh Massinger at Whitestrاند that he was detained in the Broads, and would be unable to carry out his long-standing engagement to take him round in the *Mud-Turtle* to London. But as time went on, and no news came from Massinger, Warren Relf's suspicions deepened daily. It was clear that Elsie, too, was lingering in her convalescence from suspense and uncertainty. She couldn't make up her mind to write either to Hugh or Winifred, and yet she couldn't bear the long state of doubt which silence entailed upon her. So at last, to set to rest their joint fears, and to make sure what was really being said and done and thought at Whitestrاند, Warren Relf determined to run over quietly for an afternoon's inquiry, and to hear with his own ears how people were talking about the topic of the hour in the little village.

He never got there, however. At Almundham Station, to his great surprise, he ran suddenly against Mr Wyville Meysey. The Squire recognised him at a glance as the young man who had taken them in his yawl to the sandhills, and began to talk to him freely at once about all that had since happened in the family. But Relf was even more astonished when he found that the subject which lay uppermost in Mr Meysey's mind just then was not Elsie Challoner's mysterious disappearance at all, but his daughter Winifred's recent engagement to Hugh Massinger. The painter was still some years too young to have mastered the profound anthropological truth that even with the best of us, man is always a self-centred being.

'Well, yes,' the Squire said, after a few commonplace of conversation had been interchanged between them. 'You haven't heard, then, from your friend Massinger lately, haven't you? I'm surprised at that. He had something out of the common to communicate. I should have thought he'd have been anxious to let you know at once that he and my girl Winifred had hit things off amicably together.—O yes, it's announced, definitely announced: Society is aware of it. Mrs Meysey made it known to the county, so to speak, at Sir Theodore Sheepshanks's on Wednesday evening. Your friend Massinger is not perhaps quite the precise man we might have selected ourselves for Winifred, if we'd taken the choice into our own hands; but what I say is, let the young people settle these things themselves—let the young people settle them between them. It's they who've got to live with one another, after all, not we; and they're a great deal more interested in it at bottom, when one comes to think of it, than the whole of the rest of us put together.'

'And Miss Challoner?' Warren asked, as soon as he could edge in a word conveniently, after the Squire had dealt from many points of view—all equally prosy—with Hugh Massinger's position, character, and prospects—'is she still with you? I'm greatly interested in her. She made an immense impression on me that day in the sandhills.'

The Squire's face fell somewhat. 'Miss Challoner?' he echoed. 'Ah, yes; our governess. Well, to tell you the truth—if you ask me point-blank—Miss Challoner's gone off a little sud-

denly.—We've been disappointed in that girl, if you *will* have it. We don't want it talked about in the neighbourhood more than we can help, on Hugh Massinger's account, more than anything else, because, after all, she was a sort of a cousin of his—a sort of a cousin, though a very remote one; as we learn now, an extremely remote one. We've asked the servants to hush it all up as much as they can, to prevent gossip; for my daughter's sake, we'd like to avoid gossip; but I don't mind telling you, in strict confidence, as you're a friend of Massinger's, that Miss Challoner left us, we all think, in a most unkind and ungrateful manner. It fell upon us like a thunderbolt from a clear sky. She left a letter for Winifred, saying she was leaving for parts unknown, without grounds stated. She slipped away, like a thief in the night, as the proverb says, taking just a small handbag with her, one dark evening; and the only other communication we've since received is a telegram from London—sent to Hugh Massinger—asking us, in the most mysterious, romantic school-girlish style, to forward her luggage and belongings to an address given.'

'A telegram from London!' Warren Relf cried in blank surprise. 'Do you think Miss Challoner's in London, then? That's very remarkable.—A telegram to Massinger! asking you to send her luggage on to London!—You're quite sure it came from London, are you?'

'Quite sure!—Why, I've got it in my pocket this very moment, my dear sir,' the Squire replied somewhat testily. (When an elder man says 'My dear sir' to a very much younger one, you may take it for granted he always means to mark his strong disapprobation of the particular turn the talk has taken.) 'Here it is—look: "To Hugh Massinger, *Fisherman's Rest*, Whitestrand, Suffolk.—Ask Winifred to send the rest of my luggage and property to 27 Holmbury Place, Duke Street, St James's. Explanations by post hereafter.—ELSIE CHALLONER."—And here's the letter she wrote to Winifred: a very disappointing, disheartening letter. I'd like you to read it, as you seem interested in the girl. It's an immense mistake ever to be interested in anybody anywhere! A very bad lot, after all, I'm afraid; though she's clever, of course, undeniably clever.—We had her with the best credentials, too, from Girton. We're only too thankful now to think she should have associated for so very short a time with my daughter Winifred.'

Warren Relf took the letter and telegram from the Squire's hand in speechless astonishment. This was evidently a plot—a dark and extraordinary plot of Massinger's. Just at first he could hardly unravel its curious intricacies. He knew the address in Holmbury Place well; it was where the club porter of the Cheyne Row lived. But he read the letter with utter bewilderment. Then the whole truth dawned piecemeal upon his astonished mind as he read it over and over slowly. It was all a lie—a hideous, hateful lie. Hugh Massinger believed that Elsie was drowned. He had forged the letter to Winifred to cover the truth, and, incredible as it seemed to a straightforward, honest nature like Warren Relf's, he had managed to get the telegram sent from London by some other person, in Elsie's name, and to have

Elsie's belongings forwarded direct to the club porter's, as if at her own request, by Miss Meysey. Warren Relf stood aghast with horror at this unexpected revelation of Massinger's utter baseness and extraordinary cunning. He had suspected the man of heartlessness and levity; he had never suspected him of anything like so profound a capacity for serious crime—for forgery and theft and concealment of evidence.

His fingers trembled as he held and examined the two documents. At all hazards, he must show them to Miss Challoner. It was right she should herself know for exactly what manner of man she had thrown herself away. He hesitated a moment, then he said boldly: 'These papers are very important to me, as casting light on the whole matter. I'm an acquaintance of Massinger's, and I'm deeply interested in the young lady. It's highly desirable she should be traced and looked after. I have some reason to suspect where she is at present. I want to ask a favour of you now. Will you lend me these documents, for three days only, and will you kindly mention to nobody at present the fact of your having seen me or spoken to me here this morning?' To gain time at least was always something.

The Squire was somewhat taken aback at first by this unexpected request; but Warren Relf looked so honest and true as he asked it, that, after a few words of hesitation and explanation, the Squire, convinced of his friendly intentions, acceded to both his propositions at once. It flashed across his mind as a possible solution that the painter had been pestering Elsie with too pressing attentions, and that Elsie, with hysterical girlish haste, had run away from him to escape them—or perhaps only to make him follow her. Anyhow, there would be no great harm in his tracking her down. 'If the girl's in trouble, and you think you can help her,' he said good-naturedly, 'I don't mind giving you what assistance I can in this matter. You can have the papers. Send them back next week or the week after. I'm going to Scotland for a fortnight's shooting now—at Farquharson's of Invertnar—and I shan't be back till the 10th or 11th. But I'm glad somebody has some idea where the girl is. As it seems to be confidential, I'll ask no questions at present about her; but I do hope she hasn't got into any serious mischief.'

'She has got into no mischief at all of any sort,' Warren Relf answered slowly and seriously. 'You are evidently labouring under a complete misapprehension, Mr Meysey, as to her reasons for leaving you. I have no doubt that misapprehension will be cleared up in time. Miss Challoner's motives, I can assure you, were perfectly right and proper; only the action of another person has led you to mistake her conduct in the matter.'

This was mysterious, and the Squire hated mystery; but after all, it favoured his theory—and besides, the matter was to him a relatively unimportant one. It didn't concern his own private interest. He merely suspected Warren Relf of having got himself mixed up in some foolish love-affair with Elsie Challoner, his daughter's governess, and he vaguely conceived that one or other of them had taken a very remarkable and romantic way of wriggling out of it. Moreover, at that precise moment his train

came in; and since time and train wait for no man, the Squire, with a hasty farewell to the young painter, installed himself forthwith on the comfortable cushions of a first-class carriage, and steamed unconcernedly out of Almundham Station.

It was useless for Warren Relf now to go on to Whitestrand. To show himself there would be merely to display his hand openly before Hugh Massinger. The caprice of circumstances had settled everything for him exactly as he would have wished it. It was lucky indeed that the Squire would be away for a whole fortnight; his absence would give them time to concert a connected plan of action, and to devise means for protecting Elsie. For to Warren Relf that was now the one great problem in the case—how to hush the whole matter up, without exposing Elsie's wounded heart to daws and jays—without making her the matter of unnecessary suspicion, or the subject of common gossip and censorious chatter. At all costs, it must never be said that Miss Challoner had tried to drown herself in spite and jealousy at Whitestrand poplar, because Hugh Massinger had ventured to propose to Winifred Meysey.

That was how the daws and jays would put it, after their odious kind, over five o'clock tea, in their demure drawing-rooms.

What Elsie herself would say to it all, or think of doing in these difficult circumstances, Warren Relf did not in the least know. As yet, he was only very imperfectly informed as to the real state of the case in all its minor details. But he knew this much—that he must screen Elsie at all hazards from the slanderous tongues of five o'clock tea-tables, and that the story must be kept as quiet as possible, safeguarded by himself, his mother, and his sister.

So he took the next train back to Lowestoft, to consult at leisure on these new proofs of Hugh Massinger's guilt with his domestic counsellors.

(To be continued.)

THE BLIZZARD OF THE NORTH-WEST.

THE word 'blizzard' was first used in January 1866 to designate the wintry storms peculiar to the north-western States and Territories, at which date one of the worst of these storms swept over the prairies of Minnesota and Dakota. The blizzard belongs to the prairies of North America, as distinctly as the simoom belongs to the deserts of Arabia; but the results are more disastrous to human life. Every country is visited by storms; but in no other country than these prairies of the north-west do we read of blizzards. They are as much worse than ordinary snow-storms as a hurricane on the ocean is worse than an ordinary wind. Imagine snow driven by a wind blowing at the rate of from forty to sixty miles an hour, with the thermometer registering from twenty to forty degrees below zero Fahrenheit. That is a blizzard! Fortunately, they do not visit us usually more than three or four times in the winter, and sometimes a winter is passed without one being recorded. The loss of life to man and beast resulting from these blizzards in the past has been appalling; but never has one

caused so many deaths as that which visited this section during the week ending January 14 of the present year. In this storm, it is estimated that over two hundred people were frozen to death in Minnesota, Dakota, Nebraska, and Kansas.

The first of these storms of which any record is found occurred on December 31, 1863, when the thermometers in St Paul, Minnesota, registered fifty-two degrees below zero. In January 1866 another of these blizzards passed over this section, and in that storm Captain Field, together with twenty of the members of the 2d Minnesota Volunteer Cavalry, perished while marching from Fort Wadsworth (now called Fort Sisseton, in Dakota Territory) to Fort Abercrombie. Again, in January 1873 a disastrous blizzard passed over Minnesota and Dakota, resulting in death by freezing to sixty-six persons. But the blizzard of this year proved the most disastrous to human life on record, chiefly because the storm came so suddenly and the temperature fell so rapidly that it is a miracle how any one exposed to the fury of the elements escaped. The morning had been bright and sunny—indeed, such a one as is seen seldom in the depth of winter in this climate. It presented itself to farmers and others as a good opportunity to visit the distant towns for supplies; it was hailed with delight by commercial travellers who desired to visit their customers in outlying villages; children who had been unable to attend school for days because of the severity of the weather, started out cheerfully to the school-houses, in many instances more than a mile distant across the prairies; and stockmen and cowboys hailed the beautiful morning with delight as they saddled their horses and rode out on the range to look up the cattle in their charge. As noon drew near, light clouds gathered and obscured the sun, while snow fell gently; but almost without any warning, the whole appearance of the heavens is changed. The light clouds grow blacker, the wind commences to blow a hurricane, the snow is whirled across the prairies at the rate of forty to fifty miles an hour, and the thermometer falls to twenty and thirty degrees below zero so quickly, that it seems as though no one exposed to the storm can escape. Such was the fury of the tempest that men were lost a few yards from their own houses, the snow being driven into their faces with so much violence as to blind them. The noise made by the wind was so great that where the members of a party became separated from each other they could not hear one another's voices even at the distance of a few yards.

The experience of a commercial traveller in Dakota is worth recording. In company with about twenty passengers, he was about half-way between two stations, when the violence of the storm made it impossible for the engine to push its way through the snow, which had drifted in a cut to the depth of three or four feet in an incredibly short space of time. The engineer attempted to back the train to the station he had left a short time before, but the snow had drifted on to the track so as to render this impossible; and another attempt to run ahead resulted in the engine sticking fast in the snow, with the cold so intense that the pipes froze and rendered it

useless. All that afternoon, night, and the next morning till afternoon, the passengers and trainmen lived in the coaches, comfortable so far as warmth was concerned, because, with a stove at each end of the coach and plenty of fuel, that was no difficult matter; but very uncomfortable otherwise, having little or no food, and being unable to see the telegraph poles only a few feet from the track, so violent was the storm. As near as they could judge it was about nine miles from the nearest station; but none of them had the desire to attempt the journey, at anyrate on foot, as long as the storm lasted. However, some time after noon of the second day some citizens from the nearest town courageously started out with sleighs to rescue those in the snow-bound train. The transfer to the sleighs having been made, the horses' heads were turned towards home. But to drive with the howling wind and drifting snow in their backs was one thing—to face it, another, and before the town was reached, every one in the party was more or less frost-bitten. The sleigh in which Mr Burdick, the commercial traveller, was riding was upset in a drift, and every one had to look out for himself and walk. Mr Burdick had been in several bad storms, but he says that when he gained his feet after the upset, the storm was so severe that he was blinded and unable to locate the hotel or decide which direction to take. He, however, struggled on manfully, wading through the snow-drift as well as he could, sometimes walking, at other times crawling, until he fell, unable to rise, and felt unconsciousness gradually creeping on, which he knew was a sign that he was freezing to death. Fortunately, one of the other sleighs passed where he was lying, and he was conveyed to the hotel, where he was resuscitated, but suffered from blindness for two days, as well as with a frozen face, ears, hands, and feet, from which he will not recover entirely for months to come.

Another incident is recorded where a lady school-teacher left the schoolhouse with two of her pupils to go to her home, about a quarter of a mile distant. As they did not reach the house by the time they ought, a search-party was organised; but no trace of them was discovered until after the storm had abated, when the children were found frozen to death in the embrace of the lady, who had also perished. She had evidently struggled against the storm until its severity had exhausted her; but even then she had attempted to save the little ones by shielding them from the elements with her own body.

Incidents of heroic actions were not rare. We read of several men in one town starting out on foot to rescue the passengers in a train which was snowed-up only a short distance from a station. These brave men, in order to find their way had to take ropes and form a line between the telegraph poles; and by following this rope-walk, the passengers were rescued, and just at a time when the fuel in the train was exhausted, and after they had been several hours without food. The rescuers suffered more or less from frozen hands and feet, but counted their sufferings as nothing when compared with the lives their courage had saved.

One lady school-teacher kept her thirteen pupils in the schoolhouse until the violence of the wind

blew the door down. Then tying them together, and attaching the rope to her own person, in order to prevent the possibility of the party becoming separated from each other, she took the youngest in her arms, and after an heroic struggle against the blinding snow and bitter cold, reached the nearest farmhouse in safety with all her pupils.

Fortunately, such severe storms as the one just referred to are very rare, in fact, as nearly as the writer can ascertain, this last is the fourth within the last twenty-five years that has been attended with fatal results; and although this section is visited by blizzards often three and four times every winter, the only way to account for the absence of fatalities is that in most of the cases the storms gave timely warning of their approach.

IN DANGER'S WAY: A TALE OF TWO HEROES.

CHAPTER V.—CONCLUSION.

WHEN morning dawned, the wind had dropped, and the storm-clouds were no longer blackening the sky; but the waves along the beach at Shingle Point, impelled by the rising tide, still made themselves heard. The daylight looked in through a cottage window; it lit up a small room—so small that the bed at one end, although only a little one, occupied nearly half its dimensions. Upon this bed lay Max Von Roûn; and in a chair at the bedside sat Captain Satchell. The captain presently rose and drew aside the curtain.

At this moment Von Roûn's mother came in and glanced anxiously towards the bed. 'Still asleep?' said she.

The captain nodded; then he asked: 'How is the brave lad who saved your son's life?'

'Badly bruised, but in no danger. He is being well cared for up at the *Six Bells*. I have just been there to inquire.'

This conversation, though carried on in a whisper, awakened Von Roûn.

The captain sat down on the edge of the bed. 'Well, Max,' said he, 'what cheer?' and he placed a gentle hand on the young sailor's shoulder.

Von Roûn looked about him with a vacant stare. His eyes presently fastened upon his mother's face. 'Mother, how did I come here?'

The woman tried to answer; but she sank down with a sob at the bedside, her son's hand in both her own.

'My lad,' said the captain in a husky voice, 'you've been saved from drowning—saved off Shingle beach.'

These words brought a still more dazed look into Von Roûn's eyes; but all of a sudden his face brightened. 'Ah, I remember, captain; I remember everything now.' He raised himself upon his elbow and listened. The sound of the waves broke upon his ear. 'Captain, I came back yesterday, in the face of that storm, because I couldn't rest. You can guess why.'

Captain Satchell gave him a shrewd look, but said nothing.

'It was midnight, and low tide,' the young sailor went on, 'when I first caught sight of the *Cora*. She was lying, with some feet of sea below her, wedged in between two rocks.

It was a bright moonlight night; but there was a wind rising, and heavy clouds were coming up, and I had no time to lose. I could see the waves breaking against her starboard side. The masts were gone: she looked like a hulk that might go to pieces at any time. I hurried forward over the slippery rocks; but suddenly I became aware that some one was following me. I looked round: it was Stephen Walsh.

'Ah!' cried the captain.

'Yes; Stephen Walsh was coming up quickly behind. I saw my chance. The clouds would cover the moon before he could overtake me. I darted forward, leapt on board, and hurried below. The cabin still held together, but was nearly half under water; the lid of the locker wasn't an inch above water-mark. I had brought some small tools with me, and I got the locker open in two minutes. As soon as I raised the lid, I could not suppress a shout of joy. The moonshine which entered through the broken skylight overhead showed me a small tin box; it was lying among some damp books and clothes. I opened it, and a large and brilliant diamond was glittering before my eyes. It was like a vision; for next moment those dark clouds obscured the moon: the cabin was in darkness. But I had got my prize.' Again his face brightened. Presently he resumed. 'I reached the deck just in time to see a lingering glimmer of moonlight above the horizon, towards which the clouds were now being driven by a stiffening wind. But this light dotted with stars went out, as the light had done out of the diamond, and the whole sky was darkened. I couldn't see an inch before me. I heard an angry shout; but I took no notice of that. Neither was Stephen Walsh nor was I in a mood to meet at such a moment. There is no saying, if we had met, what would have happened.' For a while Von Roïin was silent; then he concluded in a few words. 'The tide had turned; and the waves, as I had reason to know, were already leaping over the deck. At any moment, if I didn't get instantly back to the rocks, I might be struck down and washed into the sea. I groped to the side, crept over the broken planks as best I could, and got safely on shore. There was almost as much need to hurry over the rocks; for, as I crept inland, more like a crab than anything else, I heard great waves coming up behind me, and felt the splash of spray on my shoulders. In this manner I slowly reached my boat. I had taken the precaution to hoist a lamp to the masthead after sunset, and I could see it shining dimly right away in the creek. At day-break it was nearly high tide, and I at once put to sea. There was a rough breeze blowing, and the sky threatened a gale: but I hoped to get here before the storm; for the wind, as I reckoned, would carry me across in a few hours. I was within sight of Shingle Point when the storm burst upon me; and although I stuck to the helm until the boat capsized, I had given myself up for lost before it happened.'

A knock now being heard at the door, Von Roïin's mother went out to answer it; and she presently came back to report that Captain Satchell was wanted up at the *Six Bells*.

It was a sunny morning, and a fresh wind

was blowing over the cliff; and as the mariner walked towards the inn and looked around, he thought of all that had happened last night. A sense of gratitude rose in his heart—a sense of thanksgiving for his chief-mate's escape out of the perils of that storm.

There was a horse and trap standing at the door of the *Six Bells*, which the captain recognised as Mr Norland's. He was asked by the landlord to step up-stairs; and in a private room looking out upon the sea, he found the ship-owner 'pacing the deck.' Cora was seated at the window. She rose as the captain came in and held out her hand.

'How can I thank you?' said she. 'We have heard what happened last night. It was all through my folly that—'

'Tut, tut!' interrupted the ship-owner. 'What had you to do with it? I'll have no sentiment.—Sit down, captain. The rumours this morning at Southsea Bay were so contradictory and so alarming, that we determined to come over and learn what really *had* happened.—Will you go and see, my dear,' added Mr Norland, turning to his daughter, 'what they can give us for breakfast? I want to have a talk with the captain.'

Cora was only too glad of an excuse to leave them. Having given the necessary instructions about breakfast, she hurried out into the sunshine; and what was more natural than that she should turn her steps towards the sea? The nearest way to the sea from the *Six Bells* led past a certain cottage. At the door of this cottage, as Cora approached, she saw Von Roïin's mother. It would have been unkind to have walked by without inquiring after her son; so the girl stopped at the gate and said: 'Father and I have driven over; we could not rest. We heard such dreadful reports this morning. We feared that Captain Satchell and—and others—were drowned. I'm so glad it's not true.'

Von Roïin's mother, beaming with smiles, held the gate invitingly open. 'Won't you step in? Max was wishing, only a minute ago, that he could see you.'

The young sailor was seated in the armchair by the kitchen fire when Cora came in. He was looking a little pale and worn, she thought; but he appeared all the more interesting in her eyes on that account. Had he not run in danger's way to win her love?

The girl sat down without uttering a word. Before reaching the cottage, she had, in her impulsive manner, felt an irresistible wish to go and visit the young sailor. She did not know—she only surmised—that he had been in search of the diamond. All she knew was that he had narrowly escaped drowning; and not until that moment, although Cora had known Von Roïin since childhood, did she realise how deeply she loved. But now—now that she was seated beside him—she wished herself back at Southsea Bay. She felt confused—vexed with herself for her impetuosity.

'Cora,' said Von Roïin, in an earnest voice, 'when I left you the other evening—the evening upon which I brought you Abel Honeywood's letter—I made a stern resolution. Shall I tell you what it was?'

The girl looked about her as if she had thoughts

of making her escape. But the door was closed, and Von Roën's mother, as if on guard, was in the front garden. Cora could see her through the window walking among the fruit-trees. She clasped her hands, and gave a nod at the kitchen fire.

'I resolved to find the wrecked vessel.'

'I was sure of it!' cried the girl. 'I told Captain Satchell so. He followed you; he came to Shingle Point on purpose to prevent you from undertaking so—so foolish an expedition.'

The young sailor looked searchingly into the girl's face. 'Captain Satchell came too late. I started from Shingle Point on this foolish expedition, as you call it, at daybreak yesterday morning; and I resolved not only to find the wreck—I resolved to find the diamond or never to return to England again.'

'Then why,' said the girl in her old laughing way, 'why have you come back now?'

'To bring you this!' and Max Von Roën put his hand to his breast and drew forth a splendid diamond, that glittered in a blaze of sunshine which burst upon it through the cottage window as he held it up in triumph over his head.

The girl stretched out her hands impulsively towards it.

Von Roën still held it over his head and beyond her reach. 'Stay,' said he, significantly. 'Do you remember?'

The girl cast down her eyes.

'Are you fated—if you would be happy—to become the wife of the man who gives you this?'

In a low, thoughtful tone Cora replied: 'It is my destiny.'

Von Roën held the cross towards her. 'Will you accept it, dear Cora, from me?'

She raised her pretty loving eyes to his face. He thought them far brighter than this diamond as they met his gaze.

'Yes, brave Von Roën!' cried she, throwing her arms round his neck, as she had often done when they were children. 'I could wish for no better destiny than to be your wife.'

Meanwhile, Mr Norland and Captain Satchell were having a serious talk together up at the *Six Bells*. The shrewd old mariner, finding the ship-owner in a good mood, seized the opportunity to relate Von Roën's adventure in search of the wreck. It was the most telling yarn he ever spun. 'His conduct,' concluded the captain significantly, 'deserves recognition. But there is only one reward that will content him.'

'And that is?—Ah, I understand,' said the ship-owner, 'and I cannot deny that such men merit promotion.—We must build a new brig, Satchell, and offer Von Roën the post of captain. That's the first thing to be done.—As for Cora,' added Mr Norland, 'I shall not attempt to interfere with her in her choice. A brave honest fellow like Max Von Roën is, after all, the best sort of husband.—What's your opinion?'

Captain Satchell's opinion was that the girl would never marry any one unless it was Von Roën. 'Stephen Walsh has altered his course,' he added; 'and it will take him a long time, I should imagine, to pluck up the courage to cruise about in these waters again.'

The mariner's words proved true. Walsh wisely kept out of the way; for it got noised

abroad—and there was some foundation for the rumour—that he, in his jealous passion, would not have hesitated to make an attempt on his rival's life had evil chance favoured his design.

After the new brig, *Cora*, had made her trial trip, under Von Roën's direction, the ship-owner gave his formal consent to his daughter's marriage with the young captain. And so 'destiny'—

That hath to instrument this lower world
And what is in 't—

settled the affair as Max Von Roën had hardly dared to hope a few short months ago.

THE PROGRESS OF CYCLING.

CYCLING has now become an established institution in our midst, and the past summer has witnessed the usual developments amongst those who go 'out on the wheel.' Makers have vied with each other in turning out beautiful and perfect work, with the 'latest improvements' in steering or driving. The Cyclists' Touring Club now boasts of more than twenty-three thousand members; one firm of large makers at Coventry has, first and last, disposed of upwards of fifteen thousand tricycles of a certain pattern. The German makers, long distanced in the race, are now putting forth every effort to get a share of the trade in bicycles and tricycles; and if there is a fall in price this year in machines, it is not unlikely that it will have been owing to German competition. Over a thousand skilled workmen are busy in Germany, and it is calculated that they turn out seven thousand machines a year. The annual number sold of English and German machines together is said to be about twenty thousand. Many of the workmen in Germany are Englishmen. Every considerable town has now its place for hiring or selling bicycles or tricycles, and there are over a dozen newspapers or magazines devoted to this interest. In London and other large towns, cycles are largely used for business purposes, being made to carry goods. In America, tricycles are used by every class of Americans from physicians to telegraph boys; and it is reported that there are five hundred lady tricyclists in Washington. Medical men in our midst have been recommending this exercise to ladies, with certain reservations, so that this form of exercise has in all likelihood even a greater future before it.

The exercise is not limited to youth. At a cycling gathering at Coventry, last season, Major Knox-Holmes, eighty years of age, was engaged along with another gentleman on a tandem tricycle in the difficult task of reducing the thirty miles record. Singular to say, the pair succeeded. The recent cycling race with horsemen at the Agricultural Hall in London is another development of racing which called forth much public interest. A Roads Improvement Association has been started for the purpose of securing proper road maintenance, and attention to finger-posts and milestones—all matters of great importance to cyclists.

What is known as the 'Safety' or low two-wheeled bicycle, with the saddle placed between these wheels, made rapid strides in popularity last season. Its prospects appear to be quite as good this season, and many cyclists purpose taking it

up in place of the ordinary bicycle or tricycle. One of the novelties at the recent Stanley Show, London, was a tandem safety called the 'Lightning,' by Messrs Hall and Phillips, the American inventors of the machine. These gentlemen say that they have practically ridden this machine for eight hundred miles on the road. Two other makers have introduced a novelty of the same description. Another, an American cycling invention, which has been taken up by the Rudge Cycle Co., Coventry, is the 'Roadsculler,' which consists of two large wheels placed side by side, and a smaller wheel in front, as in an ordinary front-steering tricycle, but instead of being worked by treadles, is propelled by an action almost the same as that of sculling. A sliding seat, such as is fitted in racing-boats, is placed below the axles of the driving-wheels; and handles resembling those of sculls, and which are worked backwards and forwards in a similar manner, are placed on each side of the sculler. The steering is done either by the feet, or by pulling one hand harder than the other. It is said to be as fast as a cycle on an ordinary road, with the advantage that all the muscles of the body are brought into play, and the rider always faces the way he is moving.

We have just heard of two recent attempts to adapt steam to road-cycling, although the law against driving steam tricycles more rapidly than road-engines may prevent their development meantime. The Rev. J. Thomas Jones, LL.D., vicar of Curdworth, Warwickshire, has invented a method of applying steam to the propulsion of a tricycle. We are told that using one of Tangye's vertical boilers of the size commonly needed to work a one-horse power engine, he obtained from it, with a piston of four square inches surface, and steam at sixty pounds pressure, as much as six horse-power, indicated by the friction brake. We need not attempt to describe here the novel features of the machine, for which Dr Jones has applied for a patent, and which was fully described in the *Birmingham Daily Post* in January last. In *La Nature* for September 17, 1887, there is described another form of steam tricycle, the joint invention of Messrs Roger de Montais and L'Heritier. With one person, this novel carriage makes a speed of from nine to eleven miles an hour; with two, from eight to nine miles. The picture shows a front-steering sociable, having a body of the gig type; the riders have a footboard for their feet; the boiler, which looks like a small barrel on end, stands between them and the steering-wheel, the top being almost on a level with the rider's knees. The two large wheels are forty-seven and one-quarter inches diameter, the front wheel twenty-six and three-quarter inches. The boiler is heated by petroleum from a vessel which holds sufficient for ten hours' consumption. The water-tank contains water for two and a half hours, without replenishment. At first sight, it would appear that a really serious inconvenience would arise from the driver's vicinity to such a mass of heat as a steam-boiler; but we have not seen that anything has been said about this, and possibly some plan may have been fallen on to obviate the apparent inconvenience.

Of the beneficial effect of cycling to those engaged in sedentary occupations, we can speak from experience. Open air and cheerful healthful

exercise are the best tonics in existence. You do not need to be as ambitious as Mr Stevens, who journeyed round the world, to get the benefit of the exercise; a spin of ten or twenty miles on a good road will put you in excellent trim. For the timid, the middle-aged, and for ladies, the tricycle is most useful. Of course, the bicycle being a single-track machine, is best for rough roads, long journeys, and great speed. Our own experience is limited to the tricycle, which we have ridden on all kinds of roads—good, bad, and indifferent. In the selection of a machine it is well to hear the experience of several riders. Each rider may have his pet machine and praise it hugely, or he may painfully expose its faults. One must remember, also, that every new season brings fresh improvements in machines sold, and that a second-hand machine which is constantly needing repairs is not always a cheap machine. What with the spokes breaking and the tires needing fresh rubbers, a second-hand machine is often a doubtful bargain. Avoid what are known as 'taugent' wheels, that is, wheels which have the spokes twisted round and laced, instead of being 'headed' in. When one spoke gives way, the whole wheel is sent off its equilibrium. Admirable advice may be had as to improvements, lamps, and everything concerning the pastime, from a perusal of the Cyclists' Touring Club *Monthly Gazette* (139 Fleet Street, London), and other magazines and newspapers devoted to its interest. The guides and hand-books on the subject are too numerous to be mentioned here. The work on *Cycling* by Viscount Bury and G. Lacy Hillier is a perfect cyclopædia on the subject; while there is much curious information in Spencer's *Bicycles and Tricycles, Past and Present*.

In a sentence or two, we condense some good advice for beginners, which we have gained by experience or gleaned from others. Before beginning to exercise, it is well to have a doctor's assurance that there is no organic disease or weakness about the body which might render cycling unsafe. Choose the machine which is best fitted for your age, weight, strength, and size, for the condition of the roads you may have to ride, and which is in keeping with the amount you may have to spend. If some other member of your family, especially of the opposite sex, cares to go out with you, the purchase of a tandem may add greatly to the enjoyment of the exercise. Drive at first on level ground, at slow speed, and only for a short time and distance. It is foolish to try much hill-climbing until the muscles are braced with the exercise; this but proves discouraging. 'Never ride,' says one writer, 'for a record of speed or distance; ride not as an American, to be able to tell how much you have done; nor as an Englishman, merely for the muscular pleasure, but as a German would ride, for the benefit of both mind and body.'

Never ride directly after a full meal; if you do, you will have a sense of oppression, and your movements will be more languid than they ought to be. It is well to dress loosely, and best in all-wool. The tricycle is the best liniment ever invented for joints that have grown stiff through want of use. A ten-mile run will throw your 'nervous depression' to the winds. It leads to healthy action of the stomach and of the skin

and liver. We feel thankful for this form of recreation, by means of which one may drink in refreshment at every pore. While many make it a task and more toilsome than it need be, with most persons it strengthens brain and nerve, sweetens the temper, hardens the muscles, and makes those who practise it moderately, hardier and healthier.

IN A TURKISH CITY.

SECOND PAPER.

MOST of the streets in Scodra are far from being gay. The roadway is generally loose and pebbly, for it serves the double purpose of a road in dry weather and of a watercourse in the winter, when the Kiri overflows. At intervals, usually in front of some great gateway with massive wooden doors, are rows of boulders, which act as stepping-stones in the rainy season for those who wish to cross the street. The footpath is a raised causeway, sometimes a couple of feet above the road, in order to avoid the floods. There is no view at all; for on either hand rise high walls of cobble-stones, over which may perhaps be seen the red roofs of the houses they encircle, and the trees which beautify the courtyards and gardens kept so jealously guarded from the public eye.

My own little cottage will perhaps serve as a type of the houses in Scodra. Like the rest, it is hidden away behind its high stone walls, and its gateway is a huge and imposing affair like the entrance to a fortress. In front of the house is a bare little courtyard paved with cobble-stones, and containing the well with its curious hand windlass for drawing up the water. For some reason or other, this courtyard is covered in autumn with a luxuriant growth of chamomile, which renders the hot air heavy with a medicinal odour, and makes walking difficult except in the paths that get worn through the mass. It never enters into any one's head to uproot this growth: it is there, and we accept it with resignation. Beyond the courtyard, and separated from it by a slight fence, is the garden. It contains two or three olive trees, half-a-dozen vines, and a couple of mulberry trees, representing the three staple products of Scodra—oil, wine, and silk. To my own exertions are due the magnificent crop of tomatoes, the green peas, the other vegetables, and the glorious mass of flowers in one corner.

The house itself faces this little domain, and is a small one-storied cottage, built, like the wall, with cobble-stones from the bed of the Kiri, and plastered white all over. The roof is low; and the eaves project far over the walls, giving shelter from the burning sun in summer, and from the pitiless rain in winter. On the ground-floor is nothing but a servant's room, the rest being a wide open space, where wood, charcoal, and other stores are kept, and where the Albanians sometimes stable their horses and cattle. The house is really the half of a larger building, but was cut off from the other part many years ago. The

open balcony which runs along the front of all the houses of Scodra, has been shut in, to make a bedroom and an entrance-hall; while the ladder which formerly gave access to the first floor, has been roofed over and turned into a staircase. On this, the only floor, there are, besides the entrance-hall, two bedrooms, a sitting-room, and a kitchen. There is nothing remarkable about the other rooms; but my bedroom, which was in all probability the *harem* when an Albanian family occupied it, is a typical native room. It is lighted by three small square windows, guarded by an ornamental wooden lattice. These windows are about a foot from the ground, and only go half-way up the wall to where a broad shelf of carved wood runs all round the room, and is the general receptacle for every odd and end that can be stowed away nowhere else. Between two of the windows is the fireplace, a curious whitewashed erection resembling a small shrine. The hearth-stone is a broad octagonal slab, and was used on grand occasions for burning a whole log of wood at a time, as our ancestors burned the Yule-log. Opposite the fireplace is a deep alcove, panelled with carved wood; and above it a sort of balcony, to which access is given by a tiny staircase hidden in the wall. This recess once contained the carved oak-chest in which an Albanian bride's *trousseau* is stored; but now it serves as a wardrobe for my clothes, and as a convenient place for ranging my boots, over which huge rats tumble and disport themselves all night long.

Next door is the kitchen, where, with the most primitive of stoves and two or three tin pots, Simon the cook contrives to elaborate the most excellent dishes. I am proud of my cook, and with reason, for he is about the best cook in Scodra; indeed, on his own showing he is the only one. Occasionally he becomes inflated with pride, and gets restive, but is quickly brought to reason by the threat of sending to Trieste for a cook. Of course I have no such absurd intention; but Simon is given over to the idea so prevalent among the lower classes abroad, that the Bank of England cellars are full of new sovereigns, and that Englishmen have only got to go and take a few shovelfuls when they want money for any of their mad freaks. But then many educated foreigners will assert with all seriousness that England does everything with gold, and that even our soldiers never fight, but bribe the enemy to run away, as a French paper is persuaded they did at Tel-el-Kebir. Simon has a wife and family somewhere in the town, and does not sleep in the house, but disappears soon after dinner to reappear early the next morning.

Unlike the cook, who is an Albanian, Achmet, my personal servant, is a pure Turk. He is what corresponds to a university graduate in Turkey; but still, though he is a learned man, and writes his intricate language fluently, he does not disdain to put his entire energies into my service for the time being. And energies they are. He has none of the gravity of a Turk, and no one has ever yet

seen him walk. Correctly attired in a dark suit, and with his fez sticking straight up on his head, he goes about his marketing errands at a gait half shuffle, half trot, his beady little brown eyes glittering, and his umbrella tucked tightly under his arm after the manner of Mr Paul Pry. During the Russo-Turkish war, he managed to become the government's creditor for a considerable sum, just at the time when all government debts were being paid in *Caimées*, or paper money, when they could no longer be postponed. For a long time the worthy Achmet's importunities were met with fair words; but as he at last became wearisome, he was given an order for his money on the treasury of the vilayet of Scodra, to insure his leaving Constantinople. He arrived almost penniless in Scodra, where the governor, who had not been able to pay his troops for months, and who did not know where to turn for supplies of food for his men, treated the order on his empty treasury with scant ceremony. Poor Achmet was now at his wits' end; he fell ill from sheer privation, and was taken to the military hospital, where, when he grew stronger, he acted as general servant for his daily bread. This was his darkest hour. He had lost everything but a ragged suit of clothes, and the papers that proved the government's indebtedness to him; when one day he heard that the Austrian vice-consul had dismissed his servant and was looking for another. Achmet at once applied for the place; but was so miserable an object, and so ignorant of European ways, that it was with great hesitation the vice-consul allowed him to come for a week or two on trial, as there was no one else to be had. In a month, Achmet had become a very different being: his illness, brought on by hunger and despair, had completely left him; he had bought a neat dark suit of clothes with his first wages, and had become so excellent and trustworthy a servant, that his master would not have parted with him under any consideration. When the Austrian left Scodra, Achmet came to me; and a more faithful and hard-working servant no man was ever blessed with in the East or elsewhere.

A very little way off lives the consul who watches over the interests of the empire of China in Scodra. He is an amiable, shy, little man, whose pasty complexion gives him the appearance of having been parboiled. His official residence is a huge barrack not long erected, about which the poor little consul used to wander like a forlorn ghost. His chief friend and confidant is his dragoman, a worthy native of the town, whose eldest daughter has been educated in Europe. The lonely consul saw this girl, who had returned to her cottage home dressed in European costume, and speaking French with considerable fluency; but for a long while he kept his thoughts to himself. The poor child felt naturally rather like a fish out of water when she returned home, for she had become quite accustomed to European ways; while her mother and two sisters still clung to their loose Turkish trousers and oriental habits. But the fairy Prince was at hand. The little consul saw and loved; but the functionaries of the Chinese empire are not allowed to contract marriages at random, and without the leave of their imperial master; so the lover wisely kept his own counsel,

and sent in a formal application to his chiefs for permission to marry a girl with whom he had hardly exchanged two words in his life. In due time an imposing parchment arrived granting the required indulgence, and sealed with an imperial seal of portentous dimensions. The next day the consul placed the precious document and its envelope carefully into an inner pocket, and set off to pay a visit to his dragoman. The object of his affections was not in the room, so he timidly inquired after her. In the East, the head of a house assumes an extremely apologetic attitude towards a guest when speaking of his womankind, and considers a wife rather a thing to be ashamed of; but as his daughter had been educated *alla Franca*, the dragoman bowed so far to European customs as to summon her. The consul did not waste words—perhaps he could not trust himself to speak; but he pulled the enclosure from his pocket and thrust it into the girl's hands, saying simply: 'Read it.' Speechless with astonishment, she opened the document, and, stumbling through the preamble, saw, to her utter amazement, that the emperor granted permission to his trusty servant the consul to marry the lady mentioned in his application. It was perhaps the most original situation ever imagined.

The consul broke the silence. 'I have my august master's permission: what is your answer?'

Stammering something about consulting her parents, the girl rushed from the room; and her suitor, picking up his precious papers, took his leave.

The rest may be easily imagined. Consuls do not grow on wayside hedges. The family's acceptance was quickly notified to the lover; and he, prompt and decided in action, instantly secured the services of the priest. Every obstacle was overcome; the greatest secrecy was observed; and on the Sunday following this unique proposal, a little procession left the dragoman's house soon after sunset. First marched the *caravans*, gorgeous in his scarlet uniform, carrying a lantern in his hand, and too philosophical to betray any astonishment at the curious customs of the Franks. Then came the consul in his best black broadcloth frockcoat and billycock hat, with his bride leaning on his arm. Immediately behind the happy pair came the bride's two sisters, in Albanian dresses, shuffling along in their loose slippers, and with their full silken trousers rustling with aggressive newness, giggling behind their veils at the double impropriety of being out after dark and of seeing their sister leaning on a man's arm just like a Frank. The father and mother of the bride brought up the rear. The priest was waiting for the party; and the consul was married to his dragoman's daughter before more than half-a-dozen people in the city knew that there was ever an engagement between them.

The next day, the fact came out; and the gossip and amazement it excited were to be remembered; all the principal Christian merchants deeply regretting that their daughters had not been educated *alla Franca*, and resolving to rectify the mistake with the least possible delay. These good resolutions soon passed away when the nine days' wonder was over; but my neighbour remains with an amiable wife, and with

the satisfaction of having achieved the most unique proposal and wedding that ever entered the mind of man to conceive.

The other consuls are not men of such startling originality. One of them has a skittle alley in his garden; and once a week throughout the summer, consuls-general and pashas, consuls and beys, vice-consuls and Roman Catholic priests, vie with one another in bowling a heavy ball at the nine skittles at the other end of the alley. It is a capital amusement, as it combines gentle excitement and a certain amount of bodily exercise without the trouble of moving out of the shade of the spreading mulberry tree. At the other end, an Albanian gardener fags for us, and trundles back the ball with prodigious energy and never-ceasing grins. The representative of Andorra alone does not patronise these gaieties. He is an ill-tempered little man, with a hook nose and a heavy moustache, and often profits by the whole European colony being engaged at skittles, to pay one of his unfrequent visits. On returning home one day, I found his visiting card sticking out of a crack in my great outer gate. He knew I was out, but would not penetrate into the courtyard, for fear I should return and catch him before he could make his escape. I keep that card as a memorial of the high breeding shown by an official of the republic of Andorra.

For some reason or other, the kingdom of the Morea has a representative here. It is true that there is nothing for him to do; but that is just as well, for all the summer he is a prisoner in his rooms. It is far too hot to go out except just before sunset, and at that hour he dare not stir, for the cattle are then driven in from the pastures outside the city, and he has a mortal terror of cows. His predecessor nearly lost his life by rashly attempting to imitate the English, and take a cold bath directly after leaving his bed. He tried the experiment on one of the hottest days in summer; but the shock was so great that he retired shivering to his bed, and never repeated the attempt. He was quite right; it is a dangerous thing for a man of nearly forty to upset the habits of a lifetime, and use anything to wash in larger than a soap-dish.

THE MONTH: SCIENCE AND ARTS.

THE Secretary of the Edison and Swan United Electric Light Company has written an important letter to the *Times* bearing upon the subject of electric illumination. He urges that electric lighting is now possible and practicable, and that we only need legislation and the removal of the disabilities pressed upon manufacturers and others by a former Act of Parliament to obtain the great boon of a brilliant and pure light. He tells us that although there is not a single central station in the United Kingdom lighting the whole of any given area, such stations are common in America from New York to San Francisco, and are to be found at Berlin, Vienna, and many other cities of Europe. He further states that if an Electric Lighting Act rendering central stations possible be passed during the present session of Parliament, it will give immense im-

petus to the electrical trade; and that within a couple of years of the passing of such an Act, some one hundred thousand persons would find healthy and profitable employment. There is no doubt that these remarks are founded upon fact. It recently came to our knowledge that at two large paper-mills in Lancashire where the electric light has been adopted there is a saving of twenty-five per cent. on the cost of the gas previously used. We may also state that at Taunton, in Somersetshire, an Electric Lighting Company which has been in existence for more than a year has earned a dividend of five per cent. on its subscribed capital, and that additional capital is rapidly being subscribed for, so that the system may be much extended.

We hear of so many cases of burglary in which the offenders get off 'scot-free' with valuable booty, that we are pleased to notice the introduction of a Mechanical Burglar Alarm which seems to be both simple and effective. It consists of a rotating barrel containing a spring, which is coiled within it after the manner of a spring blind roller. To this barrel is attached a bell, which rings loudly directly the barrel begins to turn. The contrivance is held in check by a long cord which can be stretched in front of windows or doors, when a burglarious entry is likely to be made, and fastened to a catch-pin at any convenient point. Slight pressure upon this cord will release it from its pin, when the spring will cause the barrel to revolve and the bell to ring. The apparatus also acts as a fire-alarm, for it stands to reason that if the cord be severed by burning, the bell will immediately be caused to ring. This useful invention is being introduced by Mr Moser, of 31 Southampton Street, London.

According to some interesting researches by two French physiologists, it seems that the lungs of animals, even when in a state of perfect health, give off, besides carbonic acid, a decided poison, which is very prejudicial to animal life. It is believed that it is this poison that renders a confined atmosphere so unhealthy and dangerous. The carbonic acid expired does not wholly account for the particular effects which have been noted by these experimenters.

A singular explosion lately occurred at the town of Rochester in the state of New York. A Company there, which supplied the gas-works of the town with naphtha, pumped this inflammable liquid through a pipe two miles in length, which passed through the centre of the town. For some unexplained reason this pipe burst, and the naphtha got into the sewers to the amount of about fourteen thousand gallons. The vapour caught fire, and flames burst through the pavements in the streets and caused a number of explosions, which unfortunately led to fatal results.

Professor Milne, whose researches in earthquake phenomena are so well known, has in the *Transactions of the Seismological Society of Japan* called attention to a result of earthquakes which before has not met with the attention it deserves. He states that the gradual increasing terror has developed generation after generation in a nation subject to these terrible convulsions of nature, and that these terrors cannot but have a permanent effect upon the nation at large. He tells us that the survivors of the earthquake at

Manila in 1880 said that they had lived ten years in a minute. Again, at Chio, a year later, whole communities suddenly suffered terrors which in many cases amounted to madness; and for years after such a catastrophe, every tremor of the earth would produce a panic. Professor Milne believes that the effect of earth-disturbances upon the human race generally has been very great; and he further says, that if those forces which have been common in South America were turned loose in England or Germany, they would ultimately produce nations with no idea of permanency, and among whom everything intellectual would collapse—a result which would sink Germans and Englishmen to the lowest level in the ranks of civilised communities.

We have heard at different times so many panaceas for sea-sickness, all of which have disappointed expectation, that we are loath to give credence to a new one. It is stated, however, that the great remedy has at last been found in a substance which is called Anti-pyrene, one more product from that inexhaustible conjurer's bottle called coal-tar. This new remedy it is said has been administered with the best results, and is actually now being sold in little tablets of five grains each, which can easily be kept in the waist-coat pocket.

We have all learned to admire the great talent of Japanese artists, the chief charm of whose work is that they get their inspiration direct from nature; indeed, in some respects they may be said to be closer observers of nature than Europeans, notably in the case of the representation of flying birds, which, as we have pointed out before, they show with the wings sometimes in a downward position, which is strictly in accordance with nature, as has lately been proved by numerous instantaneous photographs. But with all our admiration for the Japanese, we can hardly endorse the opinion of one of their Commissioners, who some eighteen months ago was deputed by their government to visit the various art-centres of Europe and America. The deputation of which this official was a member has now returned to Japan, and has given in a Report, which, compressed into one paragraph, says 'that Japanese art is the only living art in the world to-day.' This Japanese critic further states that there is almost no such thing to-day as good European design, the capacity for designing having died out several centuries ago. This is indeed discouraging news for those who have believed in the forward progress of our various Art Schools throughout the country. Let us hope that it is not quite true.

Some very curious experiments have recently been made by Major King of the Engineer Corps, United States. He has converted a pair of large cannon, each weighing more than twenty tons, into an electro-magnet, by crossing their ends with a bundle of iron rails, and placing coils of wire around their muzzles in connection with a dynamo-machine. The effects obtained from this novel magnet are very wonderful, as is shown by certain photographs which are reproduced in the *Scientific American*. In one of these photographs we see a string of four fifteen-inch shells, each weighing three hundred and twenty pounds, suspended from the muzzle of one of the guns. These shells are hung one upon the other, just

as four tacks might be held up upon a toy-magnet. Some other very novel effects have been obtained from this enormous magnet.

According to the *Electrician*, an agreement has been entered into whereby London will be brought by telephone within speaking distance of the Midland counties, and ultimately also of the north of England. The details have not yet been elaborated; but it is said that Birmingham and London will be able to converse together very shortly.

We have heard so much from different sources about the abuse of tea as a beverage, that we are glad to note that Professor Sée, in a lecture lately delivered at the Hôtel-Dieu, Paris, upon the diet of patients, referred to tea as the best of beverages. He asserts that it is the best digestive known, provided that it is drunk shortly after being infused. He ridicules the idea of tea being injurious, and says that it is the best fluid upon which to maintain intellectual activity.

The task of moving a house bodily from one situation to another is one which has been undertaken more than once, especially in America. But it is not often that an enterprise of the kind has been attempted on such a scale as is now contemplated at Coney Island, New York. Here there is a building called the *Hotel Brighton*, which, like many other houses, has, in spite of a very old axiom regarding the futility of such a mode of building, been erected on the sand. At the particular point where it stands, the sea is rapidly encroaching, and the owners of the hotel have made up their minds—as they cannot keep the waves back—to remove their premises out of their reach. For this purpose, the hotel, which weighs five thousand tons and is three stories high and which has a frontage of four hundred and sixty feet, is to be cut up into three sections, and moved away on a railway constructed underneath it, by a dozen or more engines. A bathing pavilion of smaller size is to be carted away in a similar fashion. We are indebted to our contemporary *Iron* for these particulars.

The occurrence of mysterious fires in cargoes of cotton has often formed the subject of remark, and many reasons have been suggested to explain them, that of spontaneous combustion being the theory generally adopted. The Board of Trade has recently caused an inquiry to be made into a fire which occurred last December on the ship *Hawarden*, and the result of this inquiry points to incendiarism. Several matches have been found in the remains of the cotton bales which have been examined, and the presumption is that these matches were placed purposely among the cotton by the men who stowed the cargo in the ship. The inducements for the destruction of a vessel before it leaves port are not at first apparent; but it is explained by one witness that a large number of persons benefit by such a catastrophe, however the unfortunate owners of the goods or the underwriters of the ship may suffer. These favoured ones are stevedores, owners of storehouses, surveyors, lawyers, and many others. According to Dr Dupré, the well-known chemist, American cotton is so pure in substance that it is next to impossible for spontaneous ignition to occur. It is known that it is with cotton as with wool—if these fibres are highly saturated with oil, such combustion is produced under certain circum-

stances; but he distinctly gives it as his opinion that the cotton on board the ship in question was set on fire before, or while it was being put into the vessel.

A short time ago, the French government appointed a Commission to decide upon the recipient of the Volta prize of fifty thousand francs for the most important Application of Electricity; and this Commission has conferred the honour upon M. Gramme. Electricians will be glad that the prize has been awarded to one who has done so much towards the development of the modern dynamo-machine. It will be remembered that M. Gramme pointed out a new and important method of producing the electric current by means of his well-known ring-armature. It is true the principle of the ring was published some years before he applied it in the well-known Gramme Machine, but he was the first to put it upon a practicable footing.

The great Lick Telescope, about the progress of which so much has been heard during the past few years, is at length in working order, and several short trials of its performances have been made. Already a star has been discovered in the constellation Orion which no one has before seen. So far, Saturn and Neptune are the only planets which have been examined with the big telescope, for the other planets have not yet been in such a position that they could be viewed at a convenient hour. The further results of observations with this wonderful instrument will be anxiously looked for by astronomers.

The medical journals do good service in being prompt to call attention to unforeseen dangers which may threaten the community, and the *Lancet* has recently warned our theatrical artists, both amateur and professional, of a practice where danger is apt to lurk. It is known that the glare of the footlights is very uncomplimentary to the natural complexion of human beings, and therefore no actor thinks of stepping upon the stage without first going through a certain process which is known as 'making-up.' This consists generally of the application to the face of some white powder together with rouge. It is in the nature of these white powders that the *Lancet* smells danger. There is no harm in ordinary violet powders, which chiefly consist of starch; but we are told that bismuth is occasionally used, and that carbonate of lead in large quantities, mixed with chalk, is very common. When our stage friends learn that lead-colic and lead-paralysis have been sometimes traced to the use of such cosmetics, especially if used night after night, and that many milder forms of lead-poisoning have been traced to the same cause, they will do well to take heed of the caution which has been published for their benefit.

It is a matter of common report that savage nations find antidotes to snake-bite in various plants. But, judging from the number of deaths from snake-poison in our great Eastern dependency, it is very clear that there these antidotes can hardly be efficacious, or that they are unknown to the general populace. Mr Daniell Morris has lately attempted to bring together for the first time a mass of information about these plants, with a view to test the truth of their alleged virtues. It is not quite clear how he will be able to make these tests, unless he depends upon

experiments upon the lower animals; for opportunities of watching the action of snake-bite are rarely offered to an investigator who is competent to come to any conclusion respecting them. But this enumeration of the various plants referred to is the first step in a very useful direction.

According to the report of the Secretary of the Smithsonian Institution at Washington, the bison or American buffalo is all but extinct. A couple of years ago it was noted that the specimens in the Museum were of a very defective character, and it was at once resolved to replace them by fresh ones. Inquiry soon elicited the opinion that there were no bison left, except in the Yellowstone Park; but afterwards some were heard of in Montana and Texas. With very great difficulty, twenty-two buffaloes were taken in an expedition which was organised for the purpose, and their skins and skeletons, which will now figure in the Museum, are regarded as being of almost priceless value. It is not too much to say, indeed, that in a few years' time a buffalo skeleton will be almost as rare as an egg of the great auk. It is believed that besides the bison, in a few years the elk, the moose, the mountain sheep, and other animals of the United States will have disappeared.

The Chinese have the credit of having been acquainted with the art of printing many centuries before the name of Caxton was heard of; but it would seem, according to a correspondent of the *North China Daily News*, that in some places at least the art is followed in a very primitive fashion. He describes a printing establishment which is of a portable nature; for the custom in the part of the country to which he alludes is to hire the printers, who bring their type and various appliances with them, and set up a workshop on any spot required. The Chinese compositor stands in front of a block of hard wood, which is hollowed out into grooves about an inch in depth. The bottom of these grooves is filled with common stiff clay, and the various types, which are cut in square blocks of wood, are stuck into this clay until the block or frame is filled. The compositor then presses a flat board upon the top of the types, so as to give the characters a plane surface. He then brushes over their face with printing-ink, and presses paper upon them to get an impression. This he carefully scans; and if any of the types have been pressed out of position, he carefully adjusts them with a pair of pincers, which also serves as a tool for handling the types and placing them in position. It is said that this method of printing has been handed down from generation to generation for more than six hundred years.

'A Year's Insect Hunting at Gibraltar' is the title of a very interesting article contributed to the *Entomologist's Magazine* by Mr J. J. Walker, one of the officers of Her Majesty's gunboat *Grappler*. Mr Walker tells us that the insects which swarm about the Rock exhibit a great many different species. Butterflies may be found there all the year round. He has found nine hundred species of beetles, and is continually adding to their number. But besides the purely entomological interest attached to this account, we gain from Mr Walker's paper much concerning the botanical, geological, and other features of the Rock of Gibraltar. The Barbary ape is found

there in a wild state, and nowhere else in Europe. These apes, being protected, increase rapidly in numbers, and are very bold in their depredations among the gardens during the fruit season.

AN UNEXPECTED DISCOVERY.

SUPPOSED REMAINS OF THOMAS À BECKET.

ON the 29th of December 1170, Thomas à Becket, Archbishop of Canterbury, was assassinated by four English knights, in revenge for the insults which, in their opinion, he had heaped upon their sovereign lord, King Henry II. The archbishop's body was hastily entombed, and buried in the crypt of the cathedral, whence it was some years after removed to the gorgeous shrine which was erected for its reception. In the month of August 1539, that shrine was destroyed by the emissaries of King Henry VIII.; the archbishop's coffin was taken out of its resting-place, and the remains were ordered to be burnt. Some historians tell us that the order was carried out; others, no less deserving our credit, assert that the bones which were burnt were not those of Becket, whose remains had been carried away by night, and remained undiscovered. Which account are we to look upon as the true one?

After the lapse of three and a half centuries, some light has been thrown upon the answer to this question by the interesting and unexpected discovery which was made in the crypt of the cathedral a few weeks since. Under the direction of three gentlemen well known in the neighbourhood for their interest in antiquarian matters, Canon Scott Robertson, Canon Routledge, and Mr Austin, excavations were being made in the crypt with a view to the discovery of any existing remains of the foundations of the building which preceded the erection of the cathedral in its present condition. While doing so, the thought suggested itself that it might be possible to find out the exact spot where the coffin of the martyred archbishop was placed before its transference to the famous shrine. The searchers were more than rewarded for their trouble by finding a stone case, not made in the form of an ordinary coffin, but apparently made to do duty for a coffin in some sudden emergency. In the lower part of this case no bones were found; but in the upper part there were the entire remains of a human skeleton—that of a tall powerful man; the bones all carefully placed together in such fashion as to show that the body had not been primarily buried in its present receptacle, but that the bones had been hurriedly and yet reverently collected together from elsewhere and placed in their extemporised resting-place. Were these the bones of Thomas à Becket? was the question which naturally occurred to the discoverers; and although it seems impossible to decide the point absolutely, yet the burden of evidence is in favour of those who believe that they are.

In company with a friend, the writer made a pilgrimage to Canterbury to inspect the relics, and look with his own eyes upon the remains of the man who took so prominent a part in his country's history seven centuries ago. Arming himself with a permission from the Dean, he presented himself at the house of Mr Austin, the architect to the Dean and Chapter, whose

premises form part of what was once the archbishop's palace—the very place from which Becket went on his last journey to the cathedral. The skeleton was laid out carefully and reverently in the drawing-room, the body covered with a silken cloth, and the skull fixed upon moistened clay and enveloped in a damp cloth. These coverings being removed, the skeleton, which is practically entire, proved that the body must have been that of a man of just about six feet in height, with powerful limbs and strong frame. The skull showed that the owner had possessed a large mouth, of most determined character; a forehead somewhat low, but remarkably broad, and with prominent temples; the marks of the indentation of some sharp weapon upon the skull being plainly visible just above the left eye—thus suggesting immediately that the deceased had been attacked in the very manner in which we all know that Becket met his death. Strange, if the remains be actually those of the murdered archbishop, that they should rest once again, before their reinterment for ever, in a room in the very building in which he slept on the night before he met his death seven hundred and seventeen years ago!

The remains have been by this time carefully restored to their resting-place in the cathedral; but two or three photographs were taken of them while they 'lay in state,' and they were examined by anatomical experts.

As the writer and his friend left the precincts, the thought forcibly occurred: were we actually face to face with the dead archbishop of long ago? Who shall say? The discovery at least was an unexpected one, and as interesting as it was unexpected.

AT MIDNIGHT.

THE pallid moonlight through the casement drifts

A sea of silver-breaking spray, that falls

Shimmering down the darkly-shadowed walls

And oaken floor. Outside, the nightwind lifts

A rustling branch against the pane: it shifts

The shadow to and fro, and faintly calls

In soft sea-tones, learned where the slow foam crawls

In serpent-wreathed coils through craggy rifts.

O crooning west wind, dost thou bear to me

No greeting from one loved and far away?

Is there no message in thy whispering

To me awake, waiting to hear from thee

One tender prayer that her dear lips might say

Ere slumber shadowed her with drowsy wing?

GEO. L. MOORE.

The Conductor of CHAMBERS'S JOURNAL begs to direct the attention of CONTRIBUTORS to the following notice:

1st. All communications should be addressed to the 'Editor, 339 High Street, Edinburgh.'

2d. For its return in case of ineligibility, postage-stamps should accompany every manuscript.

3d. To secure their safe return if ineligible, ALL MANUSCRIPTS, whether accompanied by a letter of advice or otherwise, should have the writer's Name and Address written upon them in FULL.

4th. Offerings of Verse should invariably be accompanied by a stamped and directed envelope.

If the above rules are complied with, the Editor will do his best to insure the safe return of ineligible papers.

Printed and Published by W. & R. CHAMBERS, 47 Paternoster Row, LONDON, and 339 High Street, EDINBURGH.

'THE HERMIT LAND.'

UNTIL within quite recent times, Corea has been 'a sealed book' to Europeans. Travellers in China have occasionally made mention of the stern-looking, dignified, and unsmiling Coreans who may be seen twice a year in Pekin—members of the missions who go there periodically to pay tribute to the Emperor of the Sun and to receive the almanac for the current year; but no one ever seems to get speech with them. Remarkable alike in appearance and dress, these representatives of the Hermit Nation seem to regard all foreigners with jealousy and suspicion, and to confirm the general impression of the irreconcilable unfriendliness of the Coreans to all outside nations. These visitors to Pekin, also, never responded to any overtures for trade, and never seemed to have any desire for traffic on their own part; yet this disinclination is probably due to another cause than dislike of foreigners. In other words, it may be because they have nothing to offer, and no money with which to buy foreign products. From what is now being made known with regard to Corea, this at least seems a reasonable inference.

The area of Corea is computed to cover about ninety thousand square miles. The population has been variously estimated; but Mr W. R. Carles, who was recently vice-consul in Corea,* states it to be about ten millions, which is considerably more than has been usually supposed. In physical characteristics, the two coasts of Corea present wide differences. That of the east has a well-defined line, has almost no islands and very few harbours, and has an inappreciable tidal flow. But what ports there are on this coast remain open all the year, even in the higher latitudes; and this is the reason why Russia was so desirous of possessing Port Lazaret as a naval station for her Pacific fleet. The west coast-line,

on the other hand, is much broken up by innumerable islands, closely adjoining the mainland, the intervening spaces being large bare tracts of mud at low water, for on this side the tide recedes a great way. The action of the tide is so violent and the channels through the mud so narrow, that most of the inlets are available only for native boats. There are only some three or four accessible harbours on this coast, and the rivers which find an outlet there are frozen in the winter. The chief rivers flow into the sea on the south and west—namely, the Nak-tong, the Yöng-san, the Keum, and the Han. The Amnok, called also the Yalu, is a fine river which divides Corea from Manchuria.

The interior of Corea is described as, in the northern part, one mass of mountains down to the narrow neck between Gensan on the east and the Yellow Sea, the greatest heights being in the centre. Below this neck, the mountains follow the east coast-line, with branches running inland, thus dividing the country into a series of valleys opening towards the sea. The formation is generally igneous, and in the south the hills fall away into an almost barren plain. The population is most dense in the lowlands, and is frequently reduced by famines and pestilence. In 1886 an epidemic of cholera is said to have carried off one hundred thousand persons in the district surrounding the capital.

The climate is not a bad one, and the weather is usually bright and invigorating. But on the west coast, fogs are sudden and frequent, owing to the great evaporation from the exposed mud-tracts. The rainfall is considerable, and the winters are very cold. The people have a curious method of protecting themselves from the rain: they use a sort of overall waterproof coat made of oiled paper of a bright yellow colour. These paper coats cost only a trifle, and are very serviceable so long as they escape a rent; but when once torn, they are not to be mended by stitches. Mr Carles says he has seen an inferior kind of waterproof garment made out of paper oiled after it had been used in the schools, and the wearers

* *Life in Corea* (London: Macmillan), a work upon which we draw for most of the information in this article.

of which present to the admiring gaze a choice assortment of copy-book texts written in a large hand as models of handwriting. There is something rather attractive in the idea of this twofold utilisation.

It should be mentioned that paper is one of the chief exports of Corea to China, the only two others of any importance being timber and ginseng. The paper is said to be not only strong and impervious to rain, but also excellent for (Chinese) writing purposes, and transparent enough to be used in houses in lieu of glass windows.

Down to about 1873, the Coreans were as Ishmaelites among the nations, with their hands against every one, and with all hands against them. If they have been savage in their persecution of the Christians who endeavoured to obtain a footing among them, and cruel in the murders they have committed, they have also suffered much at the hands of Chinese and Japanese invaders. In fact, so great has been the havoc of the frequent wars, that almost all relics of the earlier history of the country have disappeared, and it is said that hardly a dozen monuments of any antiquity are to be found throughout the length and breadth of the land. And yet it is a country which claims to have historical records covering three thousand years, and from which the art of manufacturing porcelain was imported into Japan many centuries ago. During all her history, however, Corea consistently denied the right of free intercourse between foreigners and her own subjects on her own soil. The first departure from this rule was in 1876, shortly after the present king came to the throne, when a treaty was concluded with Japan which permitted the residence of Japanese at three of the ports, allowed the establishment of a Legation at the capital, and sanctioned the right of trade between the subjects of the two countries under certain restrictions. The ice thus broken, further progress soon followed; and in 1882 treaties were negotiated and partly concluded with Great Britain, the United States, and Germany. A revolution which broke out in this year in Corea caused a good deal of alarm among the foreigners who had begun to gather in the country; but it was quickly suppressed by the aid of the Chinese. Then in 1883 Sir Harry Parkes went on a special mission to arrange a new treaty of friendship and trade, and it was as a member of this mission that Mr Carles gained most of his experience of Corea.

Landing at the port of Chemulpo, night overtook the travellers on the road to Soul, the capital, and they had to find shelter in the house of a Chinese agent residing in a native village. A single description will serve to show the character of Corean domestic architecture generally: 'The house consisted of several detached dwellings, of an architecture half Chinese, half Japanese, each in its own courtyard, and generally facing south. The best of them was raised a couple of feet above the ground, and had an open balcony running along its front, somewhat after the fashion of a stage at a Chinese country theatre. The wood-work was unconcealed by paint or varnish; and the only part which bore any ornament was the lower panels of the windows and doors, the centres of which were in slight relief. Windows

and doors differed but little, each consisting of battens of wood, of which the lower half was filled in with panels, and the upper with a trellis-work covered with Corean paper. The windows slid in grooves to either side; and the doors, when thrown open or closed, were held in place by iron rings passed over knobs of the same material. The eaves of the house projected considerably, especially at the corners; and the roof was of tiles. . . . Furniture there was none; but the walls were neatly covered with white paper; and there was a general air of comfortable cleanliness about the place. Each man was furnished with a pipe with a brass bowl and mouthpiece, and a reed stem nearly three feet long; one or two small brass spittoons on the floor, and a kerosene lamp, betokening the influence of the Chinese tenant. The men were all wearing long white robes of cotton cloth; but one had taken off his conical hat, which was hanging on a peg on the wall, and had on only a tight band to keep his hair in place. The hair, dragged away from the forehead and sides of the head, was gathered together in a knot on the crown in the manner said to have been general in China previous to the establishment of the present dynasty.'

A word as to the curious headgear peculiar to the male Coreans. It is cone-shaped, not unlike the hat of a Welshwoman cut down, and is fitted with a flat circular plate three or four inches wide, which forms the brim. Both hat and brim are made of a substance perforated like the sides of a meat-safe. The hat is black, and is tied under the chin by broad black strings. The women do not wear this hat, but envelop their heads in a green mantle when out of doors—rather to conceal their want of beauty, to judge by Mr Carles' opinion of them. They wear loose baggy trousers; and the feet, which are small and well shaped, are clad in white socks and straw sandals. The men, on the other hand, swathe their feet in many folds of cotton cloth, and so require enormous shoes of the Chinese shape. The people are extremely modest both in garb and demeanour. They will not divest themselves of clothing in the hot weather, as the Japanese do; but they have invented loose wicker-frames, which fit closely to the body so as to keep the clothes from contact with the skin. This is to prevent saturation by perspiration, and thus to serve as a preventive against chills. They are great talkers, and seem to be much more fond of gossip and smoking than hard work.

Soul, the capital, is a walled city of some one hundred and fifty thousand to two hundred thousand inhabitants. The houses are closely packed together, and the main street runs for about three miles from east to west. This street is about forty yards wide, and serves as the market-place; while the side-streets are narrow and very dirty. The shops and stalls are much more interesting in themselves than for the wares they expose for sale; these, indeed, are commonplace, and Corea generally seems poor in 'curios.' The silks, for which Corea once had a sort of mythical reputation, turn out a great disappointment, being knotty, poor of lustre, and narrow in breadth. More artistic are the saddlery wares—leather ornamented with silver in an attractive manner. Pony-back, indeed, seems the only mode of loco-

motion for those who would travel distances. Sedan-chairs exist, but the Koreans have not learned to carry them, or indeed any burdens, with the deftness and labour-saving skill which seem to come natural to the Chinese. The life and movement of the streets, however, are full of endless interest, of quaint objects, and variety of colour. The officials are remarkable for the gorgeousness of their apparel, and the long robes of ordinary persons give a furnished appearance to the general picture.

The king has two palaces in Soul, and Europeans have now free access to the grounds, which in the case of one of them are nearly a mile square, and spread up the slope of a hill prettily wooded with firs. The country round Soul is broken up into rice-fields wherever water is available; and where not, cotton, maize, millet, and beans are cultivated for local consumption. There is not the most rudimentary idea of sanitation either in the provincial towns or in the capital; and the marks of smallpox are almost everywhere to be seen.

Corea is divided into eight provinces, and Mr Carles made a tour through about half of them—those, namely, of the northern portion of the kingdom, and right up to the Manchurian frontier. His object was to see the condition of the country and its capabilities for trade. Instead of hostility, he everywhere experienced the greatest friendliness and hospitality, for which no doubt the credentials he bore from the court were largely to be thanked; but he found the people poor and unenterprising, and, in more places than one, approaching the verge of starvation.

At times, on the country roads, curious figures were seen. Planted on both sides of the way would be wooden posts, on one face of which is carved a rude representation of a human face with very prominent teeth. The teeth and cheeks are coloured, and the whole effect sufficiently fiendish. These figures are called *syon-sal-mak-i*, and are intended to frighten away evil spirits from the roads and the villages. The mileposts are also often similarly decorated.

This practice seems to show a belief in spirits somewhat analogous to that of the Chinese; and in fact Buddhism prevailed in Corea in ancient days, although it has been under repression since the present dynasty came into power. Buddhist remains are frequently to be seen; and Mr Carles describes two colossal stone figures, cut out of the boulders *in situ*, which he saw on his journey. The figures are half-length, and one wears a round cap, and the other a square cap, of stone. They are supposed to represent the male and female aspects of nature, and are, with other figures of the same kind, called by the Koreans *miriok*, which seems to be the equivalent of the Chinese *mi-le*, or Buddha. But the Koreans apply the same word to all statues, and even to natural rock formations resembling human figures. There is a very large *miriok* at Un-jin which is said to be sixty-four feet high, and concerning which the following legend is current. Long ago, a country-woman was gathering firewood on the hillside, when a high pinnacle of rock suddenly sprang up through the ground. She reported the occurrence to the governor of the province, who in turn reported it to the capital. There it was decided that the rock was designed to furnish a statue of

Buddha, and the government ordered one to be cut, which was done accordingly.

It has been remarked that there are evidences of fetich-worship about most Korean villages; and the care with which snakes are avoided rather than attacked seems to suggest a survival of serpent-worship. But, indeed, there is a good deal of light yet wanted on the subject of Korean religion and folk-lore.

The pugnaciousness of the Koreans has long been traditional, and probably not without reason. At anyrate, in the important northern town of Ph्योंg-yang, stone-throwing seems to be cultivated as a fine art; and at certain seasons of the year, leave is given for a general fight among the inhabitants, when town-folk and country-folk engage in a war of stones for three days. Sometimes a man is killed, but the event is then regarded as a holiday accident, and no notice is taken of it by the authorities.

In the villages there is a species of self-government which is interesting. The village elders are divided into three classes: the *tsou-eu* and the *tjoa-shang*—who are chosen by the villagers—and the *sa-im*, who are appointed by the magistrate of the district. To the *tsou-eu* belong the settlement of all minor disputes among the villagers, and the keeping of account of the land-tax, due from every house. To the *tjoa-shang* belong the duties of looking after the roads and bridges, and of reporting the births and deaths to the *sa-im*. The *sa-im* keep the register of the population, and deposit a copy of it with the magistrate. There is a school, as we gather, in every village of importance; and about ten per cent. of the people can write Chinese, which is regarded as the only language worth learning.

Corea has some reputation for minerals, and Europeans have been diligently prospecting for gold and silver and lead, but not apparently with much success as yet. Copper-mining has been carried on to some extent by the Koreans. The trade of the country is small and of a retail character. We have already named the chief exports, and there does not seem much else to be obtained at present. At the same time, Corea is capable of producing many things if the inhabitants had only some of the energy and perseverance of their neighbours to the north, in Manchuria. Mr Carles does not have much opinion of the commercial prospects. At first, when foreigners began to come, beans were suddenly discovered to be a marketable commodity, and they were brought forward with zeal, measured, and put into bags. By-and-by the people tired of that, and found that foreigners would also buy bones. Bones then became the object of spasmodic attention, and a good trade was done in them, until zeal again slackened. And so on with other commodities.

Ginseng, which is exported to China, is a government, or rather a royal, monopoly. The king grants licenses to certain farmers to cultivate the root, and derives about one hundred thousand pounds sterling a year from the industry, such as it is. Ginseng is believed by the Chinese to have the recuperative virtues which used to be ascribed in Europe to the mandrake, and the roots are worth their weight in silver in China. The plant, which grows slowly, is raised from seeds that are sown in March. In the first or second year, the ginseng plant is only two or three inches

high, and has only two leaves. It is transplanted frequently during this period. In the fourth year the stem is about six inches high; and in the fifth year a strong healthy plant has reached maturity, though it is more usual not to take it up until it has reached the sixth season.

In conclusion, it would seem that now, when 'the Hermit Land' is at length opened up to Europeans, its reputed wealth has disappeared. Even the Japanese find it impossible to thrive on Korean trade as it exists at present; but there may be better days ahead. One cannot expect much vigour in a nation which has wilfully shut itself up from the rest of the world for three thousand years.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER XVI.—FROM INFORMATION RECEIVED.

AT Whitestrاند itself, that same afternoon, Hugh Massinger sat in his own little parlour at the village inn, feverish and eager, as he had always been since that terrible night when 'Elsie was drowned,' as he firmly believed without doubt or question; and in the bar across the passage, a couple of new-comers, rough waterside characters, were talking loudly in the seafaring tongue about some matter of their own over a pint of beer and a pipe of tobacco. Hugh tried in vain for many minutes to interest himself in the concluding verses of his *Death of Alaric*—anything for an escape from this gnawing remorse—but his Hippocrene was dry, his Pegasus refused to budge a feather: he could find no rhymes and grind out no sentiments; till, angry with himself at last for his own unproductiveness, he leant back in his chair with profound annoyance and listened listlessly to the strange disjointed echoes of gossip that came to him in fragments through the half-open door from the adjoining taproom. To his immense surprise, the talk was not now of top-sails or of spinnakers: conversation seemed to have taken a literary turn; he caught more than once through a haze of words the unexpected name of Charles Dickens.

The oddity of its occurrence in such company made him prick up his ears. He strained his hearing to catch the context.

'Yes,' the voice drawled out in a low London accent tinged with the peculiar Wapping dialect; 'I read that there book, *Our Mutual Friend*, I think 'e calls it. A pal o' mine, 'e said to me right out at the time, "Bill," says 'e, "that there Dickens 'ave took a leaf out o' your book," says 'e; "'e've been a-takin' of you off: 'e've showed you up in print, 'e 'ave, under the halias of Rogue Rider'ood," says 'e; "an' you'd oughter read it, if it was for nothin' on earth but for the sake o' the likeness."—"Is that so?" says I, never thinkin' 'e meant it, as the sayin' is. "It is," says 'e; "an' you've got to look into it."—Well, I got a 'old o' the book, an' I read it right through on 'is recommendation: leastways, my missus she read it out loud to me; she've 'ad a eddication, my missus 'ave: an' it's a pack o' rot, that's wot I calls it. There ain't no kind o' sense in it, to my thinkin'.'

'The cap don't fit you, then, says you,' the other voice retorted with a gurgle of tobacco. 'E ain't drawn you so as a man could recognise you.'

'Recognise me! Well, recognisin' ain't in it, d'ye see. Wot 'e says is just a lot o' rubbish. This 'ere Rogue Rider'ood, accordin' to the story, 'e'd used to row about Lime'ouse Reach, a-searchin' for bodies.'

'A-searchin' for bodies!' the second man repeated with an incredulous whiff. 'Wy, wot the dooce did 'e want to go an' do that for?'

'Well, that's just where it is, don't you see? 'E done it for a liveli'ood. A liveli'ood, says I, wen my missus reads that part out to me; wot liveli'ood could a beggar make out o' bodies, says I? 'Tain't as though a body was worth anything nowadays, viewed as a body, says I, argumentative-like. A man as knowed anything about the riverside wouldn't never 'a gone writin' such rubbish as that, an' in a printed book, too, as 'ad ought to be wrote careful an' ackerate. It's my opinion, says I, as this 'ere Dickens is a over-rated man. A body nowadays, wether it's a drowned body or a nat'ral body, ain't worth nothing, not the clothes it stands up in, viewed as a body. Times was wen a body was always acshally a body, an' worth savin' for itself, afore the 'Natomy Ack. But wot's it worth now? Wy, 'arf a crown for landin' it, paid by the parish, if it's landed in Essex, or five bob if you tow it over Surrey side o' the river. Not but wot I grant you there's bodies an' bodies. If a nob drowns hisself, wy, then, o' course there's sometimes as much as fifty pound, or might be a 'undred, set upon the body. 'Is friends is glad to get the corpse back, an' 'ave it buried reglar in the family churchyard. A reward's offered free enough for a nob, I don't deny it. But 'ow many nob's goes an' drowns thei'selves in a season, d' you suppose: an' 'oo as knowed anything about the river would go a-lookin' for nob's in Lime'ouse Reach or way down Bermondsey way?'

'Stands to reason they wouldn't, Bill,' the other voice answered with a quiet chuckle.

'O' course it stands to reason,' Bill replied with an emphatic expletive. 'Wen a nob drowns hisself, 'e don't go an' throw hisself off London Bridge; no, nor off Blackfriars neither, you warrant you. 'E don't go an' put hisself out aforehand for nothin' like that, takin' a 'bus into the City, as you may say, out o' pure foolishness. 'E just claps 'is 'at on 'is 'ead an' strolls down to Wes'minster Bridge, as it maybe 'ere, or to Charin' Cross or Waterloo—a lot of 'em goes over Waterloo, perlice or no perlice; an' 'e jumps in close an' 'andy by 'is own door, in the manner o' speakin', an' is done with it immejately.—But wot's the use o' lookin' for 'im after that, below bridge, away down at Lime'ouse? Anybody as knows the river knows well as a body startin' from Waterloo, or maybe from Wes'minster, don't go down to Lime'ouse, ebb or flow, nor nothin' like it. It gets into the whirlpool off Saunders's Wharf, an' ketches the back-current, an' turns round an' round till it's throwed up by the tide, as you may say, upward, on the mud at Millbank, or by Lambeth Stangate. So there ain't no liveli'ood to be made any'ow by picking up bodies down about Lime'ouse; an' it's always been my opinion ever since then that that there Dickens is a very much overrated person.'

'There ain't no doubt about it,' the other answered. 'If 'e said that, there can't be no doubt at all about it.'

To Hugh Massinger, sitting apart in his own room, these strange scraps of an alien conversation had just then a ghastly and horrible fascination. These men were accustomed, then, to drowned corpses! They were connoisseurs in drowning. They knew the ways of bodies like regular experts. He listened, spellbound, to catch their next sentences. There was a short pause, during which—as he judged by the way they breathed—each took a long pull at the pewter mug, and then the last speaker began again. ‘You’d oughter know,’ he murmured musingly, ‘for I s’pose there ain’t any man on the river anywheres as ‘as ‘ad to do with as many bodies as you ‘ave.’

‘That’s so!’ the first person assented emphatically. ‘Thirty year I’ve served the Trinity ‘ouse, rain or shine, an’ you don’t provision light-ships that long without learnin’ a thing or two on the way about bodies. The current carries ‘em all one way round. A body as starts on its journey at Wesminster, as it may be ‘ere, goes ashore at Millbank. A body as begins at London Bridge, comes out, as reg’lar as clockwork, on the furrer end o’ the Isle o’ Dogs.—It’s just the same along this ‘ere east coast ‘ere. I picked up that gal I’ve come about to-day on the north side o’ the Orfordness Light, by the back o’ the Trinity groyne or thereabouts. A body as comes up on the north side of Orfordness ‘as always drifted down from the nor-west’ard. So it stands to reason this ‘ere gal I’ve got lying up there must ‘a come with the ebb from Walberswick or Aldeburgh, or maybe Whitstrand: there ain’t no other way out of it any’ow. Well, they told me at Walberswick there was a young lady a-missin’ over ‘ere at Whitstrand—a young lady from the ‘All—a lady o’ property, seeming—and as there might be money on it, or again there mightn’t, wy I come up ‘ere o’ course to make all proper inquiries.’

Hugh Massinger’s heart gave a terrible bound. O heavens! that things should have come to this pass. That wretch had found Elsie’s body!

In what a tangled maze of impossibilities had he enmeshed himself for ever by that one false step of the forged letter. This wretch had found Elsie’s body—the body that he loved with all his soul—and he could neither claim it himself nor look upon it, bury it nor show the faintest interest in it, without involving his case still further in endless complications, and rousing suspicions of fatal import against his own character.

He waited breathless for the next sentence. The second speaker went on once more. ‘And it don’t fit?’ he suggested, inquiringly.

‘No; it don’t fit, drat it,’ the man called Bill answered in an impatient tone. ‘She ain’t drowned at all, the young lady as is missing at the ‘All. They’ve ‘ad letters an’ telegrams from ‘er, dated later nor the day I found ‘er. I’ve ‘anded over the body to the county perlice; it’s in the mortuary at the Low Light; an’ I shan’t ‘ave no more nor ‘arf a crown from the parish after all for all my trouble. Suffolk and Essex is half-a-crown counties; Surrey’s more liberal: it goes to five bob on ‘em. Wy, I’m more’n eight shillin’s out o’ pocket by that there gal already, wot with loss of time an’ travellin’ expenses an’ that. Next time I catches a body unbeknown knockin’ about permiscuous on a lee-shore, with the tide runnin’, an’ the breakers

poundin’ it on its face on the shingle, they may whistle for it theirselves, that’s wot they may do; I ain’t agoin’ to trouble my ‘ead about it. Make a liveli’ood out of it, indeed! Wy, it’s all rubbish, that’s wot it is. It’s my opinion that that there Dickens was a very much overrated person.’

Hugh Massinger rose slowly, like one stunned, walked across the room, as in a dream, to the door, closed it noiselessly, for he could contain himself no longer, and then, burying his face silently in his arms, cried to himself a long and bitter cry, the tears following one another hot and fast down his burning cheeks, while his throat was choked by a rising ball that seemed to check his breath and impede the utterance of his stifled sobs. Elsie was dead, dead for him as if he had actually seen her drowned body cast up, unknown, as the man so hideously and graphically described it in his callous brutality, upon the long spit of the Orfordness lighthouse. He didn’t for one moment doubt that it was she indeed whom the fellow had found and placed in the mortuary. His own lie reacted fatally against himself. He had put others on a false track, and now the false track misled his own spirit. From that day forth, Elsie was indeed dead, dead, dead for him. Alive in reality, and for all else save him, she was dead for him as though he had seen her buried. And yet, most terrible irony of all, he must still pretend before all the world strenuously and ceaselessly to believe her living. He must never in a single forgetful moment display his grief and remorse for the past; his sorrow for the loss of the one woman he had really loved—and basely betrayed; his profound affection for her now she was gone and lost to him for ever. He dare not even inquire—for the present at least—where she would be laid, or what would be done with her poor dishonoured and neglected corpse. It must be buried, unheeded, in a pauper’s nameless grave, by creatures as base and cruel as the one who had discovered it tossing on the shore, and regarded it only as a lucky find to make half-a-crown out of. Hugh’s inmost soul was revolted at the thought. And yet— And yet, even so, he was not man enough to go boldly down to Orfordness and claim and rescue that sacred corpse, as he truly and firmly believed it to be, of Elsie Challoner’s. He meant still in his craven soul to stand well with the world, and to crown his perfidy by marrying Winifred.

GALLOWES TREE ON HAMPSTEAD HEATH.

AN ancient elm stands on the verge of Hampstead Heath, over against the gardens of Wildwood, at the side of Heath Hill Road. When stripped of its leaves, the gnarled trunk and rugged limbs stand out in bold relief against the sky, the outline being filled in with a delicate tracery of twigs. Here and there a broken branch tells of the ravages wrought by wind and weather. One stunted bough which stretches out over the pathway, and must once have hung over the road, has been blasted by lightning. The lower branches, too, have been roughly hacked with axe and saw, for they still show the scars which time has but rudely healed. Yet the elm is vigorous

in its old age; and in summer-time its spreading foliage throws a welcome shade over the low wooden seat which has been put up beneath it. And every autumn its glories glow undimmed when the sun lights up the blended hues of its golden leaves, casting ever-shifting shadows, which in turn create a thousand tints. This is the Gallows Tree.

It is not perhaps so old as the Chequer Elm, which according to local tradition was planted in the days of Stephen; nor, probably, as the famous Chipstead Elm, under which it is said the Kentish rustics held their annual fairs during the Wars of the Roses; nor yet as the Crawley Elm, within whose hollowed trunk Druids may have found a retreat. But although it cannot claim so great an antiquity as these silvan monarchs, the Hampstead Elm is old enough for the legends which cluster round it to be themselves forgotten. Few, certainly, of the hundreds of couples who rest beneath it on summer evenings, or of the thousands who pass under it on their way to North End or the West Heath, even think of its associations. But it is only for the few that old-time memories have a living voice.

It is, for instance, already almost forgotten that Addison and his friends used at times to spend their summer evenings in the gardens of the *Bull and Bush*. There is now nothing to show that Dr Mark Akenside lived and practised, after a fashion, at North End. It is scarcely remembered, even by art critics, that Linnell struggled against poverty and neglect in a little farmhouse which stood on the northern edge of the heath. There is little to recall the fact that Lord Chatham spent that terrible twelvemonth in which he abandoned himself to his infirmities, at Wildwood; and the remembrance of the all-powerful minister gloomily sitting at the little oriel window and gazing away over North End across the green fields of Heath Farm and the trees of Bishop's Wood, while the destinies of the nation were trembling in the balance, is largely lost upon the crowds of holiday-makers who pass the Holly Bush and stroll through Wildwood Grove towards the Spaniards' Road, or saunter up Heath Hill Road to Jack Straw's Castle. And you may interview all the oldest inhabitants in vain as to the origin of the weird name which still belongs to this ancient elm.

Some garrulous old woman, perchance, may recount, upon persuasion, a mysterious story about Lord Chatham and Wildwood, which makes out that the tree is in some way or other connected with the death of that eminent minister. Indeed it would not be surprising if the intelligent foreigner had appropriated the notion, and now that English history is being rewritten at Paris, we may yet have some such version of the fate of the great Pitt. Nor is it surprising that mystery should surround Lord Chatham's sojourn at Hampstead, that some echoes of the suspense through which the country then passed should have come down to our own times. The house has been considerably enlarged since then—it has been raised another story—but the room in which Lord Chatham chiefly lived is still preserved; and the double-doored aperture through which the unfortunate statesman communicated with his servants is, or was very recently, still to be seen. The story has often been told; but

it is unsatisfactory in some of its details. Here Lord Chatham, it is said, lived in utter seclusion. Even his meals, we are told, were placed in the little cupboard, and the outer door being shut, a signal was given when they were ready. Now we know that while at Hampstead, Lord Chatham drove frequently about the heath; and since he went there for the sake of that dry and bracing air, which still, in spite of the inundation of bricks and mortar, makes the northern heights of London famous not only as a suburb but as a health resort, it seems to follow as a matter of course that he would walk at times on the less-frequented paths, many of which were then as secluded as the most ardent recluse could desire.

It is easy to conjure up the lovely isolation of the little straggling village. Hampstead was in 1768 'far from the madding crowd.' The fame of the Wells, which had been at its zenith during the first half of the century, was now on the decline, so that it was no longer one of the most dissipated watering-places in the kingdom; and the coffee-rooms, dancing-rooms, raffling-shops, bowling-greens, which had sprung up with the Wells, were now almost deserted. The fashionable throng, indeed, at this time seldom went farther than Belsize House, still in the height of its reputation as a place of amusement, in spite of the rivalry of Ranelagh and Vauxhall, of which it was the prototype. It was a few years later than this that four hundred coaches of the nobility and gentry came to Belsize on one occasion to see a wild-deer hunted and killed in the Park. But for the fairs, which were held on the Lower Flask Tavern Walk, and the races, which were run on the East Heath, and for the holiday-makers, who could never have been very numerous, since the population of London was then less than eight hundred thousand, much of the common must have been delightfully rural and deserted. It is, too, certain that Lord Chatham would walk in the gardens of Wildwood, where he would be free from the observation of the curious; but, beyond the possibility that he may have sat under its branches, there is no foundation for the fabled connection between Lord Chatham and the Gallows Tree.

Another legend, more shadowy still, is the only authority for the rumour that a murder was committed in the garden of Wildwood, and that the murderer expiated his crime on this convenient gibbet. This is still a favourite after-dinner anecdote at Hampstead, and its recital commonly gains an adventitious interest by whispered suggestions that the garden is still haunted by the shrieking spectre of the victim. There is, it is true, a story extant that in a summer-house here a butler once upon a time killed a confiding cook. This is, however, probably apocryphal. The names of the murderer and the victim have not been preserved. It is not even known why or how the deed was done, so that its authenticity may well be doubted.

A genuine murder was, however, committed at Fortune Green, near West End, where gypsies still do congregate in tents and caravans, and lend a general aspect of rural vagabondism to the surroundings of Hampstead Cemetery. Here one Thomas Cowley was foully done to death. The crime was believed to have been committed by Martha Bradley, a gypsy, and 'other persons

unknown.' Martha Bradley was put upon her trial; but the prosecution broke down for want of evidence, and instead of being hanged upon the Gallows Tree, the prisoner left the court 'without a stain upon her character.' This seems to be a natural inference from the fact that she spent her old age in the almshouses, which were still so characteristic a feature of the Vale of Health when Shelley, Keats, Hazlitt, and Haydon used to meet there in the house of Leigh Hunt. It is said that the old woman was in the habit of muttering to herself the details of the dark deed; while in the silent watches of the night she was overheard by her neighbours moaning and crying for mercy and pardon. The story, if true, shows that, in spite of the fitness of things, there is no link between Martha Bradley and the Hampstead Elm.

But it is not surprising that the true and veracious history of the ill-omened *genius loci* should have been forgotten; for we must go back for it for more than two hundred years. There is a rare and curious quarto tract, dated 1674, and called on the title-page, 'Jackson's Recantation, or the Life and Death of the Notorious Highwayman now hanging in chains at Hampstead, delivered to a friend a little before execution; wherein is truly discovered the whole mystery of that Wicked and Fatal Profession of Padding in the Road.' It is not a vulgar confession, for Jackson says little or nothing as to the crime for which he was condemned; but an autobiographical sketch, and therefore an early example of our now fashionable criminal literature. It has the true prison ring common to these productions in every age; and although it is owing to the enterprise of Mr Samuel Swinfincks that it saw the light, there is a *vraisemblance* about it which seems to distinguish it from the concocted catchpennies commonly sold at Tyburn, in much the same way as their modern counterparts are now hawked in the Strand. An affectation of candour, a simulation of sincerity, a veneer of penitence, are as marked traits of Jackson's 'Recantation' as of the revelations of many modern felons. In the guise of advice to the public, he contrives to give his brethren of the road many excellent hints as to the best and safest method of carrying on their profession. Any one who is robbed on the highway, for instance, is advised, instead of scouring the country, to go to Holborn Bars, St James's Street Westminster, Bankside Southwark, Lambeth, or Foxhall, in search both of thieves and property; and the advice is so far sound that it is equally useful for footpads and passengers. To lie *perdu* in London town until the hue and cry is over has always been the favourite dodge of persons 'wanted.' The tract is, moreover, really useful, as throwing a vivid side-light upon the seamy side of life in London in the middle of the seventeenth century. Even Ned Ward is not more graphic.

Early in his career, Jackson, who was born of 'poor but honest parents,' is reduced to the lowest ebb, when the lucky find, in the gutter, of a purse containing fifty guineas sets him on his legs again. He sets up as a man about town, and for a time makes a satisfactory livelihood as a sharper and blackleg. In his own expressive language, he

'nicks the nicker' very much to his satisfaction. But London becoming too hot to hold him, Jackson was easily persuaded by one of his pals to take to the road, then the recognised resource of any one who was 'down on his luck.' His career was near coming to a sudden end, for he was caught after robbing a coach near Barnet. Fortunately for him, however, the prosecutor proved amenable to bribery, agreeing not to bring any evidence against him if he restored the property!

In company with three others, he next 'infested' the Marlborough Downs, where he drove a brisk trade. Putting up at the various inns, where, according to his account, highwaymen were always welcome, they picked up plenty of information as to the movements of travellers, whom they robbed so systematically, that the band soon made themselves a terror to the whole neighbourhood.

It is curious to find in this old tract a version of the oft-told tale of how the attorney was overreached by the highwayman, and it is quite possible that this is the original, which has been stolen by later highwaymen, story-tellers, and other dishonest persons. Thomas Jackson's account is at anyrate very circumstantial. Chancing to meet at one of the inns an attorney going to London, he got into conversation with him, and, according to his custom, turned the talk upon the robberies which had recently been committed in the neighbourhood. The lawyer fell into the trap, and, with an assurance not uncommon in his profession, boasted of the immunity from robbery which he enjoyed owing to certain precautions of his own devising. No footpads, he asseverated, would rob him. Jackson expressing incredulity, the attorney, in order to justify his boast, showed him his saddle, in which he had concealed one hundred and fifty pounds in gold. Jackson at once gave his friends the hint; and the confiding lawyer was 'stopped' when he had gone a few miles on his way to London. He cheerfully gave up the loose cash which he had upon his person; but when the highwaymen cut open his saddle, he loudly proclaimed his conviction that they were in league with the Evil One.

There is another story which is probably true, because, so far as it goes, it does not redound to Jackson's professional credit. A seaman who had just landed after a long voyage and was on his way home alone with his pay (sixty-five pounds) upon him, although he had been warned that the highwaymen were out, was speedily punished for his temerity by Jackson, who relieved him of his money. Hereupon, the sailor declared that he was destitute and desperate, and offered to throw in his lot with the gang. In some way or other he succeeded in convincing them of the sincerity of his resolution, for, after a while, he was told off to accompany Jackson, who had charge of the money. But no sooner had the two got well away from the rest, than the sailor pulled out a pistol, and, in true highwayman fashion, demanded Jackson's money or his life. With a very bad grace Jackson gave up the money; and his chagrin was not unnaturally increased when the seaman made him exchange horses, the one a picked animal, the other a wretched screw.

As to the details of the crime for which he was convicted, he says nothing. All that is now known is, that when on the road near North End

he murdered and robbed Henry Miller. The offence was brought home to him, and he was condemned to death. There were then two elm-trees on Hampstead Heath, near North End, of which only one still lives, and it was betwixt the two that the gibbet was erected on which Jackson was hanged, and, after the unpleasant if morally wholesome fashion of the time, hung in chains. The post of the gibbet was afterwards used as a mantel-tree over the fireplace in the kitchen of Jack Straw's Castle. It is the surviving tree which is still known by the name of the Gallows Tree, although the episode from which it is derived has long since been forgotten.

Hampstead Heath has always figured largely in the chronicles of highway robbers and robberies. Thomas Jackson's reputation was obscured by the notoriety of his well-known contemporary, Claude Duval, who was hanged in 1669, and afterwards canonised by the mob. There are few more curious illustrations of the times than the spectacle of the body of the notorious French highwayman lying in state at a tavern in St Giles's, and being afterwards buried in state in the middle aisle of St Paul's, Covent Garden. And many of Duval's 'deeds of daring,' as they are uniformly described in the books, were committed on the highway near Hampstead and Highgate, for Hornsey Lane was that ruffian's favourite haunt. There is, too, a tradition that Dick Turpin, in the next century, lived at Hampstead; but this is without authority. Turpin's chosen rendezvous was in Hackney Marshes. In 1737, it is true, after he had shot one of his pursuers, near Epping Forest, he came to Islington, and for a time drove a thriving business in the back lanes of Holloway and Hampstead. The numbers of rich and fashionable people who frequented Belsize House when it was at the height of its popularity, as a matter of course attracted crowds of footpads to the roads by which it was reached. 'Twelve stout fellows completely armed,' it was announced in the advertisements of entertainments, regularly patrolled the London Road; and the number was soon afterwards increased to thirty. In fact, Hampstead was a rival of Hounslow Heath for highway robberies up to the beginning of the present century.

It is almost impossible for us to realise the terrorism under which our ancestors lived so long; and it seems incredible, in view of the robberies committed in London and the suburbs almost daily for nearly two centuries, that some system of constabulary was not much sooner adopted. But nevertheless, it is only within the last sixty years that the 'wicked and fatal profession of padding in the road' has been put down. The road between Kensington and London, for instance, was never decently safe until 1799, when a horse-patrol was first appointed. In the early years of the present century, robberies were constantly committed in Belgrave and Eaton Squares, then the Five Fields. A sort of volunteer military organisation was got up to protect the inhabitants of Islington, Kentish Town, and Marylebone; and the example was followed in other parts of London. But for the most part the public had to protect themselves; and such was the fear, which the ruffians of the road took good care to keep alive, that they did this after a helpless and half-hearted fashion.

As for the halo of romance which surrounded highwaymen as a class, this is scarcely to be wondered at, if we remember how completely they defied society. There were, it is said, many fair mourners for M'Lean, so that it must in those days have been looked upon as a feat to fire a pistol at a man like Horace Walpole, as he did in Hyde Park in November 1749. It is easier to appreciate the daring hardihood of Dick Turpin, who kissed Mrs Fountayn, the fashionable beauty of the season, in Marylebone Gardens. We can understand how such an act of gallantry would add to his reputation, and serve, if need were, to palliate such vulgar offences as robbery and murder.

It is customary to cry out against the penal code of the eighteenth century as repulsive in its severity, and there is an absurd amount of sympathy still wasted over the memories of highwaymen who richly deserved their fate. The number of broken-down gentlemen and bankrupt tradesmen who 'took to the road,' and so raised the 'profession' in the social scale, bore no proportion to the vulgar and depraved sections of the fraternity of thieves who pursued the trade systematically, now in the towns, now on the highways, now on the bridle-paths. The annals of highway robbery indeed show plainly that the 'gentlemen of the road' of the sixteenth, seventeenth, and eighteenth centuries were really analogous to the burglars and pickpockets of our own times. Thomas Jackson's 'Recantation,' for all its grandiloquence, shows him to have been little more than a petty and pitiful rogue.

THE LOST BOND.

IN TWO CHAPTERS.—CHAP. I.

I WAS articled to that eminent firm of solicitors, Messrs Gurney and Grafton, of Lincoln's Inn Fields, who, for the modest premium of three hundred guineas, allowed me to sit in their office and assist them with the work, with liberty to pick up law in the best way I could. Having duly served my time and passed all my examinations, I was declared by the examiners to be a duly qualified solicitor, entitled to charge a fee of six-and-eightpence for my advice.

I had not a large capital when I began my legal studies, and by the time I had finished my articles, it had become so much diminished, that I deemed it advisable to lose no time in setting to work to earn my own living. No doubt, the most prudent course for me would have been to obtain a situation with a firm of solicitors, in order to gain a little more experience; but I was young and inexperienced, and in a hurry to be my own master. I at once began to look about for a suitable locality in which to start business on my own account. This was a more difficult matter than I expected. I had no connections anywhere, and therefore had nothing either to guide or fetter me in my choice. London I left out of the question altogether, as being, in my opinion, the most difficult place for any one without influence to work up a practice in. Every place I visited seemed to be well supplied with gentlemen learned in the law, and to be in no need of further additions. However, after a good deal of inquiry and travelling about, I fixed upon

the quiet little market town of Barton in which to begin operations; and having taken an office in Church Street and engaged an office-boy, I notified to the inhabitants that I was ready to render them any legal assistance they might require, by affixing a brass plate on the door with my name and description inscribed thereon.

But the good people of Barton seemed to be either very peaceably inclined, or to be shy of strangers, for week by week and month by month went by, till six months had elapsed, and the business I had transacted had been practically nil, the little I had done being of a very unremunerative character. Meantime, the balance I had placed at the bank on settling at Barton was rapidly decreasing, the entries in my bank book being, unfortunately, all on the wrong side. In fact, I began to think I had made a mistake in setting up for myself so soon, and that the best thing I could do would be to try to obtain a situation.

I was sitting in my office one afternoon meditating on these things. I had been trying to read *Chitty on Contracts*, but I seemed unable to fix my mind on anything that day, and the book lay unheeded on the table before me. By degrees I fell into a brown-study, and was getting into quite a gloomy state of mind, when I was interrupted by the office-boy bringing in the letters. These consisted of a few bills and circulars, a requisition from the income-tax collector to fill up the amount of my income during the previous year, one or two private letters, and last, but not least, the *Law Times*. I soon disposed of the former communications, and having opened the 'Journal of the Law and the Lawyers,' prepared to refresh my mind with an account of the doings of the legal world during the week. But fate seemed against me to-day, for almost the first thing that caught my eye was an article on 'The Overcrowded State of the Legal Profession;' and when I had read, with a mournful kind of interest, an account of the alarming rate at which the profession had increased during the last few years, while the amount of fees, owing to the influence of recent legislation, was steadily diminishing, I quite agreed with the writer of the article that the profession was going to the dogs.

I threw the paper down in disgust, and walked to the window and looked out. It was a hot, drowsy afternoon, which seemed to have imparted its influence to the inhabitants, for business appeared to be almost at a stand-still, the only persons visible being a few tradesmen standing at their doors gossiping with their neighbours, or staring lazily at the opposite side of the street. Looking beyond the church, I could just catch a vision of green fields and shady trees, with here and there a glimpse of the river shining in the sun, looking delightfully cool and fresh, and making the room in which I was standing seem close and stuffy by comparison. I had just made up my mind to leave the office for the afternoon, and have a little fishing before tea, when the door opened and my office-boy entered again. 'Please, sir, Mr Thomas Jackson wishes to see you,' he said.

'Mr Thomas Jackson!' I exclaimed in surprise. 'Do you mean Mr Jackson of Oakfields Farm?'

'Yes, sir—*Farmer Jackson*,' answered the boy.

'Oh, well, ask him in,' I said, unlocking my drawer and pulling out my papers and pens, which I had just put away for the day. I knew Mr Jackson well by repute. He was a well-to-do farmer, who lived a few miles from Barton, and I was aware that he entertained a strong prejudice against lawyers, he having had a disagreeable transaction with a rather sharp firm of attorneys some years ago; and it was believed he would as soon have thought of flying as of having anything more to do with a lawyer. I therefore felt considerable curiosity as to what brought me the honour of a visit from him.

Mr Jackson entered the room rather hesitatingly, I thought. He was a stout, tall man, of about forty years of age, with a pleasant, good-humoured expression of countenance; but to-day I fancied there was rather an anxious expression on his face. After exchanging greetings, I motioned him to a chair on the opposite side of the table, and waited for him to inform me as to the nature of his business. After fumbling about in his breast-coat pocket, he drew out a narrow strip of paper and handed it to me. On examining this, I found it to be a writ issued by Mr Sharper Flint, a money-lender at Barton, against Mr Jackson, to recover the sum of one thousand pounds with interest on a bond given by Mr William Jackson (father of Thomas Jackson) to the said Sharper Flint for money lent by him, and was issued against Thomas Jackson, as executor of his father, who had died some two years before.

'Well, Mr Jackson,' I said, looking up, 'this is rather a disagreeable document. What is the meaning of it?'

'Well, that's just what I want to know,' said Mr Jackson. 'I never heard a word of any such claim before. I suppose it is some dodge of that rascally Flint to try and get money out of me.'

'You never heard of any such claim before,' I asked, 'although the writ states that the bond was given six years ago?'

'Not a word, sir,' answered Mr Jackson. 'I never dreamed of there being any such claim until yesterday, when the writ was served on me.'

'I suppose you were acquainted with your father's affairs?' I asked.

'Yes, sir. We discussed business affairs together constantly, and it was very seldom he did anything without consulting me. Indeed, now I remember he did speak to me, some years ago, about borrowing a thousand pounds, which he wanted for a temporary purpose, from Sharper Flint; but I advised him not to do so, as I had no faith in him; and he told me afterwards that he had decided to take my advice.'

'It certainly does seem strange,' I said. 'I should think it very unlikely that your father would have borrowed so large a sum without letting you know, and without leaving any trace of it among his papers. I suppose you have been through his books and papers?'

'Yes, sir; I went through them all at the time probate of the will was granted, and there is not a trace among them of any such sum having been borrowed.'

'Well,' I said, 'we are completely in the dark about it at present; and I have no materials to

go upon in advising you what course to pursue. I think the best thing will be for me to call on Messrs Crawley and Fox, Mr Flint's solicitors, and see what they have to say about the matter, and, if possible, get them to show me the bond on which they claim.'

'Yes, I think that would be the best way,' replied Mr Jackson; and accordingly it was arranged that I should see Messrs Crawley and Fox the next morning, and that Mr Jackson should call on me in the afternoon, when we could further discuss matters.

I called on Messrs Crawley and Fox the next morning as arranged, and on mentioning my business, was shown into the office of Mr Crawley, the senior partner, who, I was informed, had the conduct of the business.

Mr Crawley, a withered little gentleman, with the orthodox parchment-coloured face, was sitting at a table littered with deeds, briefs, drafts, and the miscellaneous papers which usually cumber a solicitor's table. As I entered, he looked up.

'Good-morning, Mr Crawley,' I said. 'I have called to see you about that matter of Flint v. Jackson.'

'O yes,' said Mr Crawley, leaning back in his chair and pushing his spectacles on to his forehead. 'You are acting for the defendant, aren't you?'

'Yes,' I said; 'and we are naturally very much astonished at the proceedings which you have commenced. My client informs me that he never heard of there being such a claim until he was served with the writ.'

'You don't say so!' exclaimed Mr Crawley, opening his eyes with real or well-feigned astonishment. 'Now, that's very extraordinary.'

'It is extraordinary,' I said; 'but it is quite true. Until yesterday, my client was not aware of the existence of any such claim. He has been through his father's books and papers, and can find no trace whatever of any such sum having been borrowed.'

'Dear me—dear me! that's a very extraordinary circumstance, now,' said Mr Crawley again.

'Yes,' I said; 'and before taking any steps in the matter, and either admitting or rejecting the claim, my client wishes to make a thorough investigation into the affair; and I have called to know if you will let me see the bond.'

'Oh, certainly, certainly,' said Mr Crawley—'no objection whatever;' and going to the safe, he took the document out and handed it to me.

It was a formal bond, drawn up in the usual words, by which 'the said William Jackson bound himself, his heirs, executors, and administrators, to pay the said Sharper Flint, his executors or administrators, on demand the sum of £1000, with interest at £5 per cent.:' and was signed and sealed by Mr William Jackson, and witnessed by Mr Winter, his solicitor. I examined the stamp, and looked at the date of the water-mark on the paper, but could find no flaw in the document at all; in fact, it seemed to be a perfectly valid and binding document, and to leave no loophole of escape.

'You will admit,' I said, 'that it is a very suspicious circumstance that Mr Flint should

never have mentioned the fact of his having any such bond, and should not even have applied for the interest.'

'Well,' said Mr Crawley, 'it is unfortunate that it has been left so long; but my client informs me that it was only intended to be a temporary loan, and he therefore did not include it among the amounts he had out on mortgage, and on which interest was payable regularly. In fact, it was overlooked till the other day, when he had a thorough stock-taking.'

I could not succeed in getting any further information, and therefore took my leave, not altogether satisfied with the result of my interview. I did not believe that Mr Sharper Flint was the man to forget that he had an amount of a thousand pounds due to him.

Mr Jackson called upon me, according to appointment, in the afternoon, and I reported to him what I had done.

'I must say,' I said, 'that so far, I do not see that we have any defence to the action. The bond purports to be witnessed by Mr Winter, your father's solicitor; and on the face of it appears to be a perfectly genuine document.'

'Never mind that!' said Mr Jackson, bringing his fist down upon the table. 'I feel certain that my father never had that money, and I mean to fight him, and make him prove his claim in court.'

'Well,' I said, 'I think it is too large an amount to pay without a strict investigation, especially considering the suspicious circumstances of the case; and I think it will be wiser to defend the action and let it go to trial; and in the meantime we must make a strict investigation, and get all the information we can.'

'You are right, sir,' said Mr Jackson; 'and you need not be too particular about the expense; I shan't mind paying the money so much, if they win it after a fair fight.'

I accordingly entered an appearance to the writ; and while the action was proceeding, I made vigorous inquiries in every quarter from which I thought information might be obtained. Mr Winter, the lawyer who witnessed the bond, had died about four years before, and his estate had been sold by the executors. All his papers had been destroyed, except a few which it was thought might be important, and which had been intrusted to the keeping of a Mr Corry, a solicitor at Barton. I called on the latter, and informed him of the proceedings taken against Mr Jackson; and he overhauled Mr Winter's papers, but found nothing which threw any light on the matter. I also found that all Mr Winter's clerks had left the town except one, named Rogers, who had filled the position of engrossing clerk, but who recollected very little about the matter. After thinking upon the subject, he said he thought he did recollect engrossing a bond from Farmer Jackson to Mr Flint; but he had engrossed so many documents in Mr Winter's office relating to different matters, that he could not remember any particular document; neither did he know the addresses of any of the other clerks. In fact, it seemed to be impossible to get any information about it in the town; and the only course appeared to be to find out the addresses of as many of Mr Winter's clerks as possible and ascertain if they knew anything

about the matter. But we did not wish the other side to get wind of what we were doing, lest they should place obstacles in our way; and therefore the investigation proceeded secretly and, as a consequence, slowly.

INDIAN TANKS.

BY A HINDU.

NOTHING is so dearly prized by the Indian villager as the *talao*, or tank, for its water is not only used for irrigation during the greater portion of the year, but is also the principal source of his domestic supply. There are some tanks which are formed by throwing a mound or embankment across a valley or hollow ground, so that the rain-water collects in the upper part of the valley, and, when required for the purposes of cultivation, is let out upon the low lands by sluices. Others, in hilly districts, are constructed by damming a stream where it passes through a gorge, and look almost like lakes. But the ordinary village tank in the plains is a small lake dug out of the surface of the soil, filled up mainly by the periodical rains. A few of these *talaos* are lined on all the four sides with cut stone, forming elegant works; but in an ordinary tank there are only two *gháts*, or masonry-built flights of steps, enclosed by low walls, going down a few feet under the water. At the head of the steps is a sort of terrace with backed seats, all of masonry. Besides being the usual staircases for drawing water, these *gháts* are used for bathing purposes, and as lounging-places in the evenings. The *talaos* are found principally in the Deccan, in Gujerat, and in Bengal. They are made at a considerable expense, being invariably the works of the Hindus, the wealthy and benevolent amongst whom lavish large sums of money on them. And princes vie with their opulent subjects in erecting in dry lands magnificent reservoirs, capable of furnishing water for the irrigation of large tracts of country—a work which renders their name venerable to the latest posterity.

In the hot season, the water shrinks rapidly, through continual drawing and by reason of evaporation, till in May there is hardly any left in the tank. At that time children, with their clothes tucked over the knee, delight to cross and recross the slippery bed, picking up with great glee the fish that still struggle for their existence in the muddy water of the hollows. Often the tank gets so dry that you can walk over it as easily as on a paved road. In many parts, the exposed surface is cultivated, and good wheat, peas, &c., grow in the drying mud.

Great is the joy of the people when, at the break of the rainy season, the tank begins to fill up again. In some parts, gay festivals, accompanied by curious ceremonies, take place at that time. Religious processions are formed to march to the temples in the surrounding groves, where offerings of flowers, fruits, and vegetables are made. Young damsels dance merrily on the banks; and boys rush into the rapidly filling tank, shouting and swimming about; while the aged and sedate stand by, looking on with a complacent smile. The dances which take place on these occasions, being spontaneous outbursts of heartfelt joy, are more lively and natural than

those of the professional dancing-girls; the accompanying songs, like the rhapsodies of the improvising bards, are wildly melodious and touching; and the air and figure of the dancers, wholly unstudied, have something weirdly picturesque and graceful in them. A big lady leads the dance, followed by a troop of blooming girls, who imitate her varied steps, which are always exact in time, and when she sings, make up the chorus in tunes wonderfully soft, but gay and lively.

A curious festival marks the time of the setting in of the rains in some parts of Bengal. It takes place not only on the large ponds, but also on the Ganges and on all its tributary streams. At five o'clock in the afternoon the bank becomes crowded with people, attired in gay costumes, looking on eagerly towards the water where the boats begin to move. These are all of a singular construction, and profusely decorated. Some of them are called 'peacock-boats,' from the resemblance of their make to the peacock; others, 'snakes,' being very long and narrow, and moving quickest of all; while many are decorated with the head of a horse and different devices. Idols and religious ornaments are placed in some of these boats, in the most commodious part of which are laid carpets, cushions, and pillows, covered with silk, satin, and *kinkhábs*, and fringed and embroidered with gold and silver; whereon are seated the men of rank and wealth, who are entertained by a man who dances, sings, and beats time to the oars, from which hang little tinkling bells.

But it is after the rains that the most enchanting scene is observed at a large tank, which is then full to the brim, and quite fifteen feet deep in the middle. It is an early hour in the morning. The serene cloudless sky lends a tender azure to the broad expanse of water, as it ripples under the breeze blowing on it, reflecting many a sun, as you look deep into it, flitting across from one side to the other. Close to the banks, the water assumes a deep green, the reflection of the overhanging branches of large trees, which stand on the edge, sheltering noisy little birds. In mid-water gaily swim a few couples of waterfowl, which dive among the bright lilies presided over by the lovely lotus. On the brink chirrup little birds, which timidly fly away directly they see a gorgeous peacock, radiant with joy at the sight of water, strut towards the edge, or a pair of snow-white cranes stalk forward, leading their young one between them. You see overhead the restless green flycatcher, the proud crowned hoopoe, the sly black crow, the scornful brown kite, and the poised gray kingfisher. Beyond the lake on the other side are the golden-brown stubble-fields; farther on are wide green sheets of wheat, gram, and other cereals, broken here and there by a deep-brown fallow, interspersed with stately trees—the peepul, the mango, the banian, and the palm—and clumps of bamboo or babul, through which peep the brown thatches and white roofs of the distant village.

While you have been contemplating the beauty of nature, the more interesting beauties of the village have dropped in on the *ghát* near you, most of them carrying a water-jar, which shows to advantage the graceful figures, draped in flowing robes of all colours. Among them you see an old woman with flaxen-white hair waddling near to the steps, propped on a stick, too feeble to carry

anything. Then there are matrons of forty or fifty accompanying their children; and young girls of twelve or sixteen wearing a quantity of ornaments. Taking a little rest, they go down the steps. While some perform their ablutions, and, standing chin-deep in the water, mutter prayers, others wash the household vestments, or, having finished their bathing, fill the jars, which they then balance skilfully on their heads or their waists. They leave the tank in little groups, the old women talking scandal, and the young ones whispering their love-affairs among themselves.

In the evening the village elders gather on the terrace, and, reclining comfortably on the seat, begin their daily gossiping in the intervals of smoking, while ill-clad little children gambol around on the ground. One group dilates passionately on the merits and faults of the two rival factions into which the villagers are divided; another discusses soberly the prospects of the crops and the course of prices: one party swears loudly at the vulture money-lender; another listens serenely to the religious discourse delivered by the village pandit. The shades begin to grow deeper; the cheerful and industrious ryots soon disperse home, followed a little later on by the idlers of the village.

THE TEXAN COWBOY:

HIS LIFE IN TOWN, ON THE TRAIL, AND ON THE RANCHE.

'GUESTS will please remove their pistols before entering the dining-room,' was the sign which met your eye as you stepped into the office of any of the hotels in Abilene, Kansas, in the early days when that town was the headquarters of the Texas cattle-trade for the United States.—'I'm a wolf, and it's my night to howl! I'm a bucking cayuse from Bitter Creek, wild and woolly and hard to curry! Whoop-pee! Every one take a drink!' were the words you could have heard uttered by some tipsy cowboy in any of the numerous drinking saloons in the same town almost any day or night during the season; and very often these words would be followed by shots from his revolvers, pointed in the air—just for the sake of hearing a noise, you know.

'Dance and move your feet quickly, you son of a gun, or I'll fill you so full of holes your mother will take you for a flour-sifter!' This exclamation was one often heard from one or other of the many whisky-wild frontiersmen who had picked on some greenhorn or 'tenderfoot' whom he desired to see dance, for the benefit of the crowd always to be found in the bar-rooms, and whose movements he accelerated by shooting into the floor in close proximity to his victim's feet.

'Down in time and make your game!' calls out the dealer sitting behind the faro table, at which from six to a dozen cowboys could always be found gambling, or, as they called it, 'bucking the tiger.'

'All hands around promenade to the bar! Take your partners for the next set!' shouts out the master of ceremonies, or 'herder,' as he is called, in the well patronised dance-house where cowboys, gamblers, frontiersmen, scouts, and

others whiled away the hours of night in wild carousal with the representatives of that class of women who would be found in such rough company.

Such is a picture of the frolics of the cowboy in town, who, just in from Texas by the old Chisholm Trail, has 'filled up' with fighting-whisky, which was considered the proper thing to do after his three or four months' drive across the vast prairies and swollen rivers *en route*. Here he is seen at his worst, with all the discipline maintained in camp by the foreman or 'boss-herder' removed; here he turns himself loose, to use his own expression, and acts as one of the wild cattle or horses which he is daily in company with would, if turned loose in a china-shop. From this standpoint, too, he is too often judged by people who have no idea of his life and the dangers he is surrounded with on the trail and range. In reality, the old-time cowboy is generally a wild, reckless, generous, big-hearted spirit, a rough diamond, thorough in everything he undertakes; rough, but honest; and in his camp his hospitality is proverbial. The cow-camp is a haven to the traveller, who is made welcome as he rides up, usually being greeted with the salutation: 'Light, stranger; chuck is just about ready, and I guess you can stow away right smart chance of it;' which being interpreted means: Alight; a meal is ready; and the host thinks his visitor can enjoy a good one.

The cattle he works with are the long-horned breed, raised on the vast plains of South-western Texas and New Mexico, which originally are supposed to have been introduced by the Spaniards. On these plains they are allowed to roam at will; each creature bears the brand of the owner on its side or hip; the only control exercised over them being at the yearly round-up, when the calves are branded, and such full-grown cattle gathered into a herd as are needed to send to the northern markets. These herds were until recently driven north by the cowboys crossing Red River, through the Indian nation and Southern Kansas, to the Atchison Topeka and Santa Fé Railroad, or the Kansas Pacific or Union Pacific. The road travelled is called a trail, which from time to time, as civilisation pushed westward, was changed. The government have now, however, prohibited the opening up of any new trails from Texas northward, because the emigration has been so heavy into the West in late years as to render it impossible to drive large herds of cattle through Northern Texas and Kansas without retarding settlements. 'Life on the trail' really means the life the boys used to lead in years gone by on this great thoroughfare from Texas; while 'life on the range' is usually the term used in speaking of the life at present on the cattle-ranges in Wyoming, Dakota, Colorado, and Montana, where the original long-horns from the South have been bred with fine-grade cattle of the North, resulting in larger creatures, better fitted for beef; and although they roam at will over the prairies, yet are not so wild as their fellows raised through the South.

It was no unusual thing for the old-time cattle-kings of the South to brand several thousand calves each year; and their ranges, obtained through the old Spanish land-grants, extended

over several hundred square miles. On these ranges, the ponies—descendants of the Spanish barb imported from Spain, and turned loose generations since—used for the work run at large, and of course are as wild as the cattle. When the time arrives for the start to be made with a herd, the necessary number of these wild ponies are gathered, and the cowboys have eight or ten assigned to each one to ride during the drive; this necessitates good riding, courage, and recklessness. Each morning during the drive these ponies have to be lassoed and really rebroken; for a day or two of rest will be sufficient for them to forget the control obtained over them when being ridden before.

The cattle to be sent to market are driven into an enclosure called a corral, and a second brand, called a 'road-brand,' is burnt on their sides or hips. This is done in order that the cowboy may be able to distinguish those belonging to the herd he is attached to from those in other herds from the same range; for in years gone by, these southern cattle-owners often started two or three herds up the trail the same season, besides selling to dealers who operated between the ranges and the markets. The consequence of this branding is that many a creature will be seen with its sides and hips covered with different letters, figures, and characters—the brands of the different owners through which it has passed, until the hair is only visible in patches, the flesh being burned into ridges resembling a chess or backgammon board. After the road-branding is done, the herd—usually numbering from five to fifteen hundred head—is started on the trail, with an average of twelve cowboys to each thousand head, and a foreman; and followed by a huge wagon, loaded with flour, baking-powder, bacon, coffee, sirup, sugar, and salt—the provisions for the drive, which will occupy from two to four months. The teamster with the wagon also acts as cook for the camp; and although he would not pass muster in a first-class hotel or restaurant, yet a stranger would be astonished at the excellence of the meals he cooks in the open air despite the weather.

The distance usually travelled each day is from twelve to eighteen miles, according to the distance between water; for, when possible, the camp is made every night on the banks of a stream. The start each morning is made at sunrise, with a mid-day stop from about ten o'clock till two; then drive again till about five o'clock in the evening, the cattle being allowed to graze and drink at these stops. At dusk the cattle are gathered together, usually on sloping ground, and bedded down, as it is called, the cowboys riding around the group singing loudly, to quiet the cattle, which after a short time lie down to rest. Then all but two of the boys go to camp, spread their blankets on the ground, with the heavens for their only roof, and turn in to sleep, until each is wakened in his turn to keep guard over the sleeping cattle. This is called night-herding. If the weather is stormy, then the boys may look out for hard work; for the vivid lightning and loud thunder which visit these vast prairies are almost sure to frighten the wild cattle and madden them, until they start on a stampede, running at a furious rate, regardless of all obstacles, in a vain endeavour to get away from

the drenching rain and out of sight and hearing of the lightning and thunder.

At the first sign of a regular stampede, all hands are ordered out except the cook; the horses, which are kept saddled in readiness for an emergency, are mounted; and away to the front of the wildly running herd ride the cowboys, singing and shouting as they go; for, to a certain extent, the cattle will follow the human voice; and the object of the men is to lead the foremost cattle in a circle until they mix up with those in the rear of the herd; and as they crowd together—or mill, as it is called—they are checked in their mad race and gradually quieted. All the courage and nerve of the cowboy are required in handling a stampede; for if by any accident he is thrown from his horse, he will be crushed beyond all recognition by the sharp hoofs of the maddened brutes.

But once quieted, it does not follow that the herd will again go to rest; very often the first run is followed by others, each one more furious than the last, as the cattle become more frightened, until daylight. Then a count is taken; and if any are missing, as there usually are, not only cattle but men, the surrounding country is scoured for trails or fresh tracks leading away from the camp, which, when found, are followed by the man who discovers them, who, regardless of food, water, or sleep, is supposed to follow this clue until he overtakes the cattle the tracks are made by, the main herd being halted in the locality until all the strays have been brought in; or if only a few head are missing, the men who are sent to search for them are instructed to follow the main trail until they catch-up. Of course these searches mean long rides over a strange country; for often, after separating from the herd, a bunch of cattle will travel at the rate of twenty-five or thirty miles a day, usually in the direction of the range from which they were originally driven; and all the powers of endurance of the men are brought into requisition in a search of this kind, for no excuse will be taken by the foreman for the hunter's return without the cattle, except starvation really stares him in the face.

On the trail each day is a repetition of the previous one. In pleasant weather, the cowboy's life is not so hard; but in wet stormy weather he is continually in the saddle, wet through most of the time; and yet he is happy, with no other company for months than his own immediate companions. He never gets lonesome or homesick, but is always possessed of the same careless reckless spirit, which asserts itself so strongly when at the end of his drive he reaches the settlements and goes for a frolic to the town.

Life on the ranches in the north-western States and Territories differs from that on the trail in many respects, the most noticeable being, that instead of the ground for his bedstead, the heavens for a roof, and his saddle for a pillow, he has a comfortable house to live in—either a log-cabin or 'dugout,' according to the supply of timber in the neighbourhood—provided with large fireplaces, in which on a cold night the logs and pitchy pine-knots are heaped on, and where the boys can amuse themselves with cards or 'swapping lies,' as they call it, smoke, and have a good time generally, although their nearest

neighbour may be, and often is, twenty miles distant. Another difference—in stormy weather the cowboy on the ranche can usually stay in the house. Especially in the winter is his life an easy one, for at that season the cattle are pretty well left to shift for themselves, it being considered better not to drive cattle around at that season more than is necessary, as they need all their strength to keep alive through the storms, and to keep up their courage to hustle around and gather enough grass to keep them from starving, because there is no hay served to them except when running in very small herds, less than one hundred head.

The 'round-ups' in these ranges are made similarly to those on the southern, except that two are made yearly instead of one—the first, to brand the calves early in the spring and ascertain the losses sustained during the winter, which is called the general round-up, and is attended by all the cattle-owners, with their cowboys, who own herds in a certain section, probably being a hundred miles square. This is necessary, because in the north-west it is impossible to obtain large grants of land, as in Texas and Mexico; therefore, the cattle range on the public domain, and the owners build their ranches in the valley of some river, turn the cattle loose, and in the spring hunt them up at the general round-up. Then in the autumn the beef round-up takes place, when all the bullocks or steers over three years old are separated from the main herd and sent to market.

During the spring and summer months, especially at the round-up, the cowboys have to work hard; but not being engaged on one drive so long as they used to on the trail, they go to town more frequently, and consequently are not so wild when there as the old-timers on the Texas trails used to be. As this great north-west is settling up very rapidly and railroads being extended, the cowboy of the past is fast disappearing, and giving place to a perfectly civilised successor.

FAMOUS THEATRICAL RIOTS.

No candid critic can deny that of late years there has been a decided improvement in the *morale* of the histrionic art. This in the main has been brought about by men and women whose names are familiar to all lovers of the stage. The actors themselves, more than the frequenters of the theatre, have come in for a large share of public abuse; and yet it almost goes for the saying, when theatrical audiences are influenced by pure and noble motives, then it follows that those playing behind the footlights rise to the occasion. To understand the truth of our assertions, we need only take a hurried survey of one characteristic feature of the stage of sixty years ago—namely, its riots.

In the year 1679 two Cavaliers entered Lincoln's Inn Theatre, London, and attempted to set it on fire, because their greatest enemy, the Duchess of Portland, was in it at the time. The result of this attempt was a very serious affray, in which many people were injured. Again, in 1721, at the same theatre, while the play of *Macbeth* was in progress, a gentleman walked across the stage, the back of which at that period was seated for the public, to speak with a friend.

Of course the manager resented this sort of conduct, and for his pains was rewarded with a blow in the face. A brawl ensued; part of the audience supported the offender, and the other part the manager. Soon the two divisions of the house were engaged in a free fight; but the manager's division proved victorious, and expelled the other party. Matters, however, did not end here, for the marauders, reinforced from the outside, returned, smashed mirrors and mouldings, hurled lighted torches amongst the scenery, and refused to desist until compelled by the turning out of the military. In consequence of the riot, the theatre had to be closed for a week, and a guard stationed to prevent like occurrences in the future.

In 1754, Garrick, by his neglect of public sentiment, was the means of causing a serious riot. Britain and France at that time were at war; yet Garrick, without thought, engaged at great expense a number of ballet-dancers from the latter country. The consequence of the imprudent engagement was, that when the dancers appeared, a great uproar was begun by the occupants of the pit. The people who were sitting in the boxes sympathised with the dancers, and the gentlemen, urged by their ladies, descended with drawn swords into the arena. In spite of this, however, the pittites proved victorious, and clearing the theatre, destroyed everything. Thereafter, the rioters marched to Garrick's house in Southampton Street, Strand, where they attempted to do further damage, but were prevented by the military. When Garrick again appeared before the public, an apology was demanded of him; but he refused, declaring that he would rather leave the stage for ever. This threat had the desired effect.

However popular Garrick might be, he still was frequently the victim of tumults. Macklin the actor was the originator of the one we are about to narrate. Fleetwood, the manager of Drury Lane, had fallen into arrears, and a general 'strike' was declared by the actors, who pledged themselves to stand by each other. Fleetwood came to terms; but Macklin was made the scape-goat, for he and his wife were dismissed from the company. Garrick obtained a situation for the luckless pair, which was indignantly refused. Macklin published his imaginary grievances, which he affirmed originated in the conduct of Garrick. All impostors get a following of some kind; so did Macklin. Accordingly, the next time Garrick acted he was met with groans and hisses, and pelted with eggs and apples. So great was the tumult, that the curtain was dropped and the audience was dismissed. The following night, Fleetwood hired a company of roughs and prize-fighters; these he placed in the pit. As soon as the curtain rose, the disturbance began. Thereupon, Broughton, the leader of Fleetwood's improvised army, rose and said: 'Gentlemen—I'm told some people have come to interrupt the play; now, I've paid my money to hear it, and I advise them to go away quietly and not hinder my diversion.' These words were met with shouts of defiance; and fighting was the only alternative left to the mercenaries. Hats and wigs lay scattered about in all directions, and broken heads and noses were more common than otherwise. The hired men proved the victors; and after the

house was cleared of the disturbers, the remainder of the audience enjoyed the play in peace and quietness.

Not long afterwards, Macklin suffered similar treatment, but his superior did not value his talents at so high a rate as to warrant the services of a hired band; on the contrary, Macklin fell by his own devices, and was dismissed from the company.

In considering certain events in history, it is impossible not to be struck with the gullibility of humanity on certain occasions. What the generality do at times, the individual, without consideration, imagines correct. Often the curious habit displayed by the sheep is also observable in human opinion. Take the following. The Haymarket Theatre was the scene of a great riot in 1749. Throughout the city, posters announced that on a certain night a man in the Haymarket company would put himself into a quart bottle. The theatre was packed; but the conjurer did not appear. The audience, at first enraged, were easily appeased by the promise that on the following evening the performer would really appear, and use a pint instead of a quart bottle. The second night the audience was again disappointed. They had at length discovered their own stupidity, and were furious. The Duke of Cumberland, one of the occupants of the boxes, stood up with drawn sword, and advised the infuriated people to destroy everything within their reach. This was soon accomplished; and tearing down the trappings, they carried them into the street, where a large bonfire was kindled. It afterwards turned out that the hoax arose in the fruitful yet withal simple brain of the Duke of Montague.

The Duke of Cumberland was a great favourite with theatre-goers; and at his death, because certain persons appeared in the theatre without mournings, a riot took place, and was renewed, until the offenders against the public taste either absented themselves from the play or assumed the due mark of respect for the dead Duke.

The nineteenth-century theatre differs in many respects from that of the eighteenth. In the latter, the servants of gentlemen had some privileges. They had a right to remain in the seats of their masters till the latter arrived. The manners of the upper classes at that time were not altogether exemplary, and their lackeys followed suit, only they were more offensive. While sitting in the boxes, the footmen were allowed to spit or throw orange-peel into the pit; and when the appearance of their masters relegated them to the gallery, which privilege they had gratis, their conduct in no way improved. At length this gallery privilege was denied them, and flunkeydom was wroth. To give vent to their rage, the footmen congregated in vast numbers within the theatre. The uproar they caused put in the background all such past occurrences; and although the Prince of Wales was one of the audience, no heed was paid to him. The military were called out; fifteen of the disturbers were arrested, and next day suffered at the hands of the sheriff of London.

Mrs Siddons was once the victim of a cruel riot. On one occasion, while fulfilling an engagement in Dublin, a rumour got abroad that the great actress had refused to co-operate with her com-

pany in giving a benefit to an old Irish actor, West Digges. The rumour had its effect on the minds of outsiders, for when Mrs Siddons appeared, as Mrs Beverley in the *Gamester*, her reception was anything but flattering. This conduct upset her, and she fell fainting into the arms of John Kemble. The incident did not quieten the audience; but Mrs Siddons, recovering, acted on the advice of Sheridan, and made a very neat speech, which was received in silence. Never again was she the victim of an attack.

Edmund Kean once got involved in a love affair, and for his imprudence was severely criticised by the press, which went the length of advising his expulsion from the stage. Night after night the theatre was crammed; but the audience refused him permission to play, and everything went on in blind show. Kean was forced to retire to America; but bad luck also followed him there. His first engagement was at Boston, and the house was packed. Next night, only twenty persons attended, and Kean refused to allow the play to proceed. Some months afterwards, Kean again returned to Boston; but the Bostonians resolved to have their revenge. They refused to hear him; for whenever he appeared on the stage, he was met with showers of stones, bottles, bits of brass, and sticks. Poor Kean had to flee for his life. The rioters followed him to the back part of the theatre; and when they found he had eluded them, they betook themselves to his hotel, from which Kean escaped with great difficulty.

Macready visited the United States in 1849; but, unhappily, the partisans of Mr Forrest, an American actor, spread the report that the Englishman had hissed the American favourite while playing in London. In vain did Macready declare that the charge was false. Conscious of his innocence, he appeared as Macbeth in one of the New York theatres. When the curtain rose, Macready was greeted with thundering applause, as he thought. It was thunder in a sense, for it seemed to be noise without rational guides to its continuance or abeyance. He appealed to the American love of fair play; but all was without effect. Every kind of insult was heaped upon him; copper cents, eggs, apples, potatoes, lemons, and asafetida were thrown at his luckless person. It is said that chairs were hurled with great force on to the stage. The play of course was stopped.

Next night, the rioters returned; but a number of policemen were stationed amongst the audience, and these immediately expelled the turbulent spirits. The change of scene did not quell the disturbers, for in a short time they were howling round the walls of the building. The noise was deafening; but yet Macready never acted again as he did on that night. Matters came to such a pass that the military were marched to the scene. While sitting in the anteroom, Macready suddenly exclaimed: 'Hark! what's that? The soldiers have fired.' One volley followed another, and then the tumult subsided. News was then brought that several men had been shot. At once, Macready changed his clothes and walked away with the retiring audience. But although he went to a friend's house, his safety could not be insured; and he was forced to leave the city. An opportunity of doing this presented itself;

a doctor was about to drive to a dying patient in New Rochelle; but the actor took the surgeon's place, and thus escaped.

In 1809 a droll disturbance occurred at the Haymarket Theatre. Foote the actor had produced the burlesque, *The Tailors, or the Tragedy for Warm Weather*, and had thereby roused the wrath of the knights of the thimble and bodkin. So keenly did the tailors of the Metropolis feel the lampooning of the play that they sent a petition to the manager of the Company against its further production, promising at the same time that if the piece was changed, they would undertake to get a full house. The petition was spurned, as were also the threatening letters the manager received. When the play began, the first intimation the actors received of the determination of the tailors was a pair of scissors thrown at their heads. A reward of twenty pounds was at once offered to any one betraying the offender; but the only answer given to such an appeal was the hurling of other missiles. The magistrates and police were called in; they were powerless; but the Guards then stationed in London marched to the theatre and arrested nearly a score of the ringleaders.

The riots known by the name 'Old Prices' are the most notorious. Covent Garden Theatre was rebuilt in 1808; but somehow or other, the architects had managed to bring about some new changes of construction, which greatly displeased playgoers. The theatre was opened on the 18th September 1809 with a representation of the play of *Macbeth*, ending with a farce, in which the chief attraction was the well-known Madame Catalani. It was noticed when the curtain rose that throughout the audience there were scattered a goodly number of rough-looking fellows, bearing in their hands sticks and bludgeons. The overture was listened to without a murmur; but whenever Kemble stepped forward to recite the opening address, he was met with shouts to the following effect: 'Off, off! Old prices'—for the charge of admission had been raised—and 'Native talent.' Not a word of the play was heard; and Mrs Siddons fared no better than Kemble. As for the farce, it was even worse, and yet Catalani and Munden were taking part in its performance. Two magistrates appeared upon the scene, read the Riot Act, and ordered the people to depart; but the audience refused to move. Next morning, the *Times* supported the popular demand; and playgoers, encouraged from without, repaired night after night to the theatre, but refused to hear a single word. The actors were assured that the disturbance was not because of their actions, but simply from the fact that John Kemble, one individual, chose to fight John Bull.

On the third night, Kemble asked what was wanted. The reply was drastic enough. The stage was stormed, and the company had to take refuge where they could. But some of the actors unfastened the trap-doors of the stage, and in this way secured many of the disturbers, who were at once conveyed to Bow Street prison.

On the sixth night, Kemble proposed that the theatre accounts should be examined, so that the public might understand the reason for the heightened prices. The proposal was taken for victory, and a scroll of paper was unfurled by

some of the audience—the paper bore these words: 'Here lies the body of New Prices, who died September 23, 1809, aged 6 days.' The auditors appointed to examine the accounts were the Solicitor-general, the Recorder of the city of London, and the governor of the Bank of England. The result of their investigation showed that the net gain to shareholders amounted only to a little more than six per cent. For six years the receipts had been £365,983, and the expenditure £307,912, and added to this were twelve shares in the patent. Kemble, in view of these facts, felt justified in raising the prices, but terminated the engagement with Madame Catalani. The theatre was re-opened on the 10th of October; but rioting again was in the ascendant. Every one wore in his and her hat a piece of paper with the letters O. P. (old prices) printed on it. The pit became a pandemonium; playgoers, constables, soldiers, and actors fighting with each other. Kemble had to be escorted home by the military; but the crowds followed him and sang all night beneath his window.

During the scuffle, a Mr Clifford was seriously injured by the box-keeper, named Brandon. Against Brandon an action was raised, and Clifford won the case. The rioters were jubilant. They called a meeting, and with Clifford in the chair, pledged themselves to support every one injured as Clifford had been. While the meeting was proceeding, Kemble appeared on the scene, and stated that he would lower the prices, remove the obnoxious tier of boxes, and dismiss Brandon. John Bull had gained the victory, and was satisfied. So ended the notorious theatrical riots of Old Prices, they having lasted for sixty-one nights.

Well may we say that the times are changed. On the one hand we have the strange spectacle of a whole city taking a vital, nay, a personal interest in the drama; and on the other we see the passions of men roused to their keenest pitch with little regard to decency or order. The modern stage lacks the national interest, but it undoubtedly has made a great advance towards being a place for healthy and entertaining instruction both in the moral and social life of mankind.

'TILL DEATH DO US PART.'

In every Love-treaty, Death goes to the reckoning;
And now he is closing on yours and mine;
We have battled him bravely from line to line,
Till at last he is with us, his lean hand beckoning.

Nearer and nearer his shadow is blackening,
Slowly effacing our life's design;
In every Love-treaty, Death goes to the reckoning,
And now he is closing on yours and mine.

O Love! though my hand on the helm be slackening,
And a heart from a heart is hard to untwine,
Our dark night of sorrow brings brighter awakening;
The conqueror carries a message divine,
Of a treaty where Death has no part in the reckoning,
And Love evermore shall be yours and mine.

THE SWEATING SYSTEM.

It is many years since the publication of *Alton Locke* made widely known the horrors of the sweating system. This cruel industrial slavery had then been in existence a quarter of a century. Fifty years ago it was in full operation, and frequent notices of it may be gathered from books and newspapers of the period. Nor has the lapse of time brought with it the decrepitude of old age; on the contrary, as foreseen by Kingsley, the system has struck its roots deeper and extended its baleful influence more widely. We are indebted to the recently published Report on the Sweating System in the East of London, by Mr John Burnett, the labour correspondent of the Board of Trade, for many of the facts embodied in this article.

The sweating system is defined as 'one under which sub-contractors undertake to do work in their own houses or small workshops, and employ others to do it, making a profit for themselves by the difference between the contract prices and the wages they pay their assistants.' They undertake to do work at a certain price per garment, and hope to make a profit by the labour of, or by 'sweating,' those who work for them. The object of the sweater being his own gain, the inevitable tendency of the system is to grind the workers down to the lowest possible level. The scale of business of these sub-contractors varies greatly, many who are called sweaters employing only one or two assistants; while workshops in which ten, twenty, and even thirty and forty hands are employed, are common. The great mass of the workers, however, are employed in shops or houses where much fewer than twenty work, or it may be in the single room of the small sweater.

The system obtains widely in the tailoring trade, although it is not confined to it. But the clothing trade is one which is peculiarly adapted to 'sweating,' and it may therefore be taken as illustrative. The work can be done at home, and is also capable of an indefinite subdivision, which

it is the sweater's interest to foster. Under the old economy, the tailor was a skilled workman, regularly apprenticed, and trained to produce all kinds of garments from beginning to end. But the introduction of machinery, the increase of population, cheaper dress materials, and the development of the ready-made clothing trade, have altered all that. The complete tailor is being crushed out. The demand for cheap clothes has continually tended to bring down the rate of wages among the least skilful of the workers. Instead of the master tailor, his journeymen and apprentices, we have now men who only make coats or vests or trousers. Nor does the subdivision end here. 'We have cutters, basters, machinists, pressers, fellers, button-hole workers, and general workers, all brought to bear upon the construction of a coat.' The acquisition of one of these branches is so much easier than the whole trade, that multitudes of both sexes have flocked into the cheap tailoring trade as the readiest means of procuring employment. The market is flooded with labour, which has inevitably produced a reduction of prices, and thus the evils of the system are intensified. The competition produced by a labour market already congested by our home population, has been vastly increased during the last few years by the great influx of foreign immigrants. These aliens, chiefly German and Russian Jews, crowd into the East of London, and being totally ignorant of the English language, and mostly in a state of pauperism, eagerly clutch at the first opportunity of procuring a wretched subsistence. While learning some branch of the trade, they are chiefly supported by charity, and their former mode of life being such that they can subsist on much less than the English worker, the condition of the latter has become intolerable. So there has grown up in our midst a system which at its best is a grinding industrial slavery, and which now constitutes a grave social peril, and calls loudly for legislative interference.

The manufacturing clothier lets out his work to contractors. These middlemen, or contractors, sublet to other contractors, and so the work let

out in this way may pass through several hands in its course from the head contractor to the actual maker of the clothes. These middlemen are not called sweaters; it is only those who employ men, women, or children to work for them who are so denominated.

The practical working of the system may be best seen by taking the establishment of a small sweater newly commencing business. Mr Burnett thus describes it: 'First, he must have a work-room; this he finds by using the room, or one of the rooms, in which his family reside. He then obtains a sewing-machine, for which he pays two shillings and sixpence per week under the hire-purchase system. The sweater is now in a position to commence in earnest and organise his establishment. The work is already cut out for him by the head clothier or contractor. If he is able to "baste" the parts of the garment together, he probably does so himself. If not, he must employ a "baster." As a rule, the basters are men, but are sometimes skilled females. Next, he requires a machinist. Again, in the vast majority of cases men are employed, as the work is heavy, but women are also largely engaged in this capacity. A "presser" is also required. This is the heaviest kind of work in the trade, and men are invariably employed to do it. The sweater will also require the services of two or three female workers—one to work button-holes; one to do "felling;" and one as a learner, to make herself generally useful and to carry work between the warehouse and the workshop.'

Although the establishment of the small sweater is contrived to secure the greatest advantages from a subdivision of labour, it falls far behind that of the large sweater in this respect. Not only is the garment subdivided, but these sections are again subdivided so as to ensure, as far as human ingenuity can possibly do so, the maximum amount of work for the minimum of wages. With the exception of button-hole working, piecework is unknown in these shops. This would appear to be favourable to the workers, but in fact it operates in the opposite direction. So accurately can a worker's ability be gauged by a sweater, that a certain rate per day almost invariably means a certain amount of work. Where two or more hands are engaged on the same kind of work, they are seldom or never paid the same wages; each is paid accordingly as he produces. In this way subdivision is carried to its utmost limits. And this explains the absence of piecework, since by these means the worker is under a rule stimulating to production much more rigid than that of piecework.

The character of the workshops varies considerably. As already stated, the smaller sweaters use part of their own dwelling, where, in the vast majority of cases, the work is carried on under the most filthy and unsanitary conditions. In a small room not more than nine or ten feet square, heated by a coke-fire for the presser's irons, and lighted at night and often through part of the day by flaring gas jets, as many as six, eight, ten, and even twelve workers may be crowded. The regulations of the Factory Acts and Public Health Acts are flagrantly violated, nor can the law be enforced with the present mode of inspection. Somewhat better than these small house-shops are the workshops built over the

back-yards of houses, which are more spacious and better ventilated, though these also are generally far from clean, and but miserable places, in which men and women are huddled together without regard to decency or health. What life must be to the wretched beings who toil in these malodorous dens from morning to night, breathing the poisonous air, and spurred to the greatest stretch of physical effort by their taskmasters, can scarcely be imagined. They may exist; enjoy life they cannot; it can only be a prolonged misery. The condition of slaves is often far more tolerable.

As regards hours of labour, females and 'young persons' are supposed to be protected by the Factory Acts, which limit the hours of labour to twelve, less an hour for dinner and half an hour for tea. The hour for dinner is usually taken, but the half-hour for tea is commonly disallowed. If a woman were to insist upon it, she would be sent about her business. A beverage the sweater calls tea, or coffee, is sometimes provided for the workers if they require it; or they may prepare it themselves with such appliances as the work-room affords, but they must bite and sup between the stitches as best they can. The hours of labour are usually from eight to eight; but some of the sweaters are reputed to make their female workers begin at six in the morning, who have then a day of fourteen hours before them. Workrooms and bedrooms are so arranged that, if the inspector pays a visit suddenly after hours, women who are kept at work beyond the regular time are shut up in a bedroom, where the inspector has no right to go. The inspector is regarded as a common enemy among the sweaters, and as soon as he is seen in a locality where they abound, the fact is flashed throughout the neighbourhood with almost lightning speed; every one is on the alert, so that one or two unexpected visits are all he can make in one locality. Men often work sixteen hours a day, less the dinner and imaginary tea-hour. In some places the hours are shorter, but in others they work eighteen hours. The average is not less than fourteen hours, and this in shops where good work is done. Overtime is not recognised at all—however many hours the worker toils, it is all counted as one day. These are the hours of the busy season, which, however, only lasts three months in the year; the other nine the workers do not average half-time. And yet it is in the slack season that the men are often most cruelly victimised as to the hours they may be called to work. The sweater so arranges matters that all the work to be done must be got out the last three days of the week. He will send for his hands and tell them that so much work must be done by Friday night or Saturday morning. Work will then begin at seven on Thursday morning, and go on uninterrupted till Friday afternoon or evening. For this spell of thirty-three or thirty-six hours' work, the men receive two days' pay. If called upon to work fractions of a day, eight hours are half a day, and four hours a quarter.

The prices that are paid for work are so various that averages cannot be obtained, or if given, would be but misleading. The best idea, therefore, can be gained by citing actual cases. It must, moreover, be borne in mind that on the average there are only one hundred and ninety-two

working-days in the year in the trade. From the following case, some idea of the gains of a small sweater may be obtained. He was engaged in making postmen's tunics at two shillings each, which he considered a good price. He could turn out twelve coats per day, for which he received twenty-four shillings. He paid presser, four shillings and sixpence; machinist, five shillings; button-holer, two shillings and sixpence, from which she must find gimp and thread; feller, one shilling and threepence; total, thirteen shillings and threepence—leaving the sweater ten shillings and ninepence for his own labour, and for finding thread, soap, coke, and machine. This sweater employed his men from seven in the morning till ten at night. His gains do not appear exorbitant; but applying the same rates to a larger sweater, one employing three, four, or five machines, the profits soon become large.

Prices for making coats range from fifteen shillings down to ninepence. At the lowest price, it is inconceivable that much profit can be made; indeed, it can only be by paying the lowest wages and the most resolute slave-driving that the sweater can make his money. But a fair estimate may be made of a sweater's gains by taking the class of coat made for one shilling and twopence. On one of these coats, after paying for labour, a margin is left to the sweater of threepence-halfpenny. A sweater employing three machines would turn out forty coats per day, his profit being estimated at fifteen shillings and twopence. On post-office coats at two shillings each, such a sweater would clear from twenty to twenty-five shillings. These may be taken as fair samples of a middle-class sweater's profit. The large sweaters have the best work, with higher prices, and consequently make proportionately larger profits. They do not themselves work at the trade, but simply direct and manage the labour of others. The lower-class sweaters do the commonest work at the lowest prices; they exact the maximum amount of labour from their hands for the minimum of wages, and themselves are very little better off than their workpeople.

Mr Lewis Lyons, however, as the result of many years spent among the sweaters and a careful study of the system, places the gains of the sweater at a higher figure. He estimates the average number of hands employed in a sweater's den at twenty. These twenty hands would be expected to produce forty garments per day at three shillings each, their gross earnings thus being six pounds. The cost of labour, &c., to the sweater is put down at a little over fifty-one shillings—thus leaving three pounds eight shillings per day as his profit.

Some three or four years ago, an investigation was made, at the instance of the managers of Toynbee Hall, and a private Report was presented to them. When this inquiry was made, the question of foreign immigration had not arrived at an acute stage. Since then, that immigration has largely increased, producing some decline in prices for work, as a consequence of increased competition. The following cases cited from this Report will illustrate the condition of workers under the sweating system:

'Case 5 is a female coat-maker who works from eight A.M. to nine P.M., with an hour and a half

for meals. She can in good times make three shillings and fourpence a day.—Case 13 is a female waistcoat-maker who until recently got only fivepence to sixpence per waistcoat, but was then receiving ninepence to tenpence from a shop recommended by the Charity Organisation Society. Found twist, thread, gimp, and machine-cotton, which would cost about a halfpenny per waistcoat. She could not earn at the above lowest prices five shillings a week, even by working from seven A.M. to twelve or one A.M., and sometimes she sat up till four in the morning to finish work.—Case 17 was an English coat-baster and finisher, who could earn two shillings and eightpence per day of twelve hours, with an hour and a half for meals. Used to work from seven till ten until the Factory Act was rigidly enforced. She was employed by a Jewish sweater, and work was irregular. The shop was closed on Saturdays, and as she could not work on Sundays, she had only five days a week.—Case 39 was a female trouser-machinist, who took work from another woman, who had it from City and other houses. She was paid threepence a pair, and could do ten pair a day if she got up at six and worked till eleven or twelve.

'Case 45 is a female trouser-finisher, who is paid fourpence per pair for large thick trousers, which she gets from a woman in the same house, who herself gets it from a sub-contractor. She could make six or seven shillings per week at this work.—Case 46 is a female waistcoat-worker, who makes waistcoats at home for eight to nine shillings per dozen; but when work was slack, they went down to seven shillings. Had to find thread, which would cost eightpence per dozen. Earned from seven to thirteen shillings per week: the highest figure would mean twelve hours' work per day.—Case 47 is a trouser-maker, who can only earn one shilling and sixpence to two shillings per day, out of which she has to find thread.—Case 53 makes children's knickerbockers at three-halfpence a pair, and can earn five shillings and sixpence per week. She works for a woman in the neighbourhood where she lives.—Case 54 makes children's suits—coat and "knickers"—for fourpence-halfpenny, and twopence for finishing, but has cotton to find. Working ten or eleven hours per day, can make four shillings and threepence a week.—Case 54A is that of a woman of fifty-five and one of twenty-four, who made children's suits of two garments. The prices for making the whole, except a little braiding, done after the work is sent back, range from threepence to elevenpence, with cotton to find. One week they started at six in the morning and worked until midnight each day, and made much above the average on suits at three shillings per dozen. Their total was eight shillings and sixpence for the week, or four shillings and threepence each. Their average weekly earnings they estimate at three or three shillings and sixpence—enough to pay the rent of their one little room, and find them in tea and bread. Both women had been bound to this trade for three months, and one had given three months' work to learn it.'

It is exceedingly difficult to arrive at any estimate of the numbers employed by sweaters which would be approximately correct. There are in the East End, at a most moderate computation, two thousand sweaters. If each employ but ten hands on the average, this gives a total of twenty

thousand persons of both sexes enduring a most cruel and grinding slavery. An informal census taken by officers of the Amalgamated Society of Tailors about five years ago gave a total of London tailors as twenty thousand, fifteen thousand of whom were employed under the sweating system. Since then, the number has considerably increased, and may be fairly estimated at from eighteen to twenty thousand.

Such a condition of things as is disclosed by Mr Burnett's Report cannot but be a fruitful source of physical, moral, and social evils. By the attractions which the sweating system offers to cheap foreign labour, the labour market is overcrowded, and the native workers are being forced out of the trade by foreigners. These, generally arriving in a destitute condition, must ultimately become a tax on the ratepayers or on charitable institutions, besides rendering entirely null all efforts to relieve the congestion of the home-labour market by the emigration of English workpeople. The overcrowding in miserable workshops, the foul air and stench, the long hours of labour, and the wretched subsistence gained, are destructive alike of health and morals. It is said that fifty per cent. of the workers suffer from heart and lung disease, and that the strongest pressers and machinists are quite worn out in from eight to ten years.

The remedies suggested are—such amendments of the Factory and Workshop Regulation Acts as will make them applicable to men equally with women; an increase in the number of inspectors, to make the acts operative, instead of the dead-letter they too frequently are now; restraining the immigration of foreign labourers in a state of destitution, by the imposition of a poll-tax or some other mode; the establishment of large factories, where all the advantages of division and organisation of labour might be gained without the intervention of the sub-contractor. It is earnestly to be hoped that something may be done by legislation or otherwise for the unhappy beings who are held in such wretched slavery. But while the demand for cheap articles of clothing continues and grows, and the overcrowded labour market makes the struggle for existence yearly more intense, these social conditions are sure to be taken advantage of by the cupidity of avaricious men, and will, we fear, greatly neutralise the best meant efforts of legislators and philanthropists.

THIS MORTAL COIL.

CHAPTER XVII.—BREAKING A HEART.

WHEN Warren Relf returned to Lowestoft, burning with news and eager at his luck, his first act was to call his sister Edie hurriedly out of Elsie's room, and proceed to a consultation with her upon the strange evidence he had picked up so unexpectedly at Almundham Station. Should they show it to Elsie, or should they keep it from her? That was the question. Fortune had indeed favoured the brave; but how now to utilise her curious information? Should they let that wronged and suffering girl see the utter abysses of human baseness yawning in the man she once loved and trusted, or should they sedulously and carefully hide it all from her, lest they break

the bruised reed with their ungentle handling? Warren Relf himself, after thinking it over in his own soul—all the way back to Lowestoft in his third-class carriage—was almost in favour now of the specious and futile policy of concealment. Why needlessly harrow the poor child's feelings? Why rake up the embers of her great grief? Surely she had been wounded and lacerated enough already. Let her rest content with what she knew so far of Massinger's cruel and treacherous selfishness.

But Edie met this plausible reasoning, after a true woman's fashion, with an emphatic negative. She stood out for the truth, the whole truth, and nothing but the truth, come what might of it.

'Why?' Warren asked with a relenting eye.

'Because,' Edie answered, looking up at him resolutely, 'it would be better she should get it all over at once. It's like pulling a tooth—one wrench, and be done with it! What a pity she should spend her whole life long in mourning and wailing over this wicked man, who isn't and never was in any way worthy of her!—Warren, she's a dear, sweet, gentle girl. She takes my heart. I love her dearly already.—She'll mourn and wail for him enough anyhow. I want to disenchant her as much as I can before it's too late. The sooner she learns to hate and despise him as he deserves, the better for everybody.'

'Why?' Warren asked once more, with a curious side-glance.

'Because,' Edie went on, very earnestly, 'she may some day meet some other better man, who could make her ten thousand times happier as his wife, than this wretched, sordid, money-hunting creature could ever make any one. If we disenchant her at once, without remorse, it'll help that better man's case forward whenever he presents himself. If not'—She paused significantly. Their eyes met; Warren's fell. They understood one another.

'But isn't it selfish?' Warren asked wistfully.

Edie looked up at him with a profoundly meaningless expression on her soft round face. 'Selfish!' she cried, making her mouth small. 'I don't understand you. What on earth has selfishness to do with it any way? Nobody spoke about any particular truer and better man. You jump too quick. I merely laid on a young man in the abstract. From the point of view of a young man in the abstract, I'm sure I'm right, absolutely right. I always am. It's a way I have, and I can't help it.'

'Besides which,' Warren Relf interposed suddenly, 'if Massinger really did write that forged letter, she'll have to arrange something about it, you see, sooner or later. She'll want to set herself right with the Meyseys, of course, and she'll probably make some sort of representation or proposition to Massinger.'

'She'll do nothing of the kind, my dear,' Edie answered promptly with brisk confidence.—'You're a goose, Warren, and you don't one tiny little bit understand the inferior creatures. You men always think you know instinctively all about us women, and can read us through and through at a single glance, as if we were large print on a street-poster; while, as a matter of fact, you never really see an inch deep below the surface.—I'll tell you what she'll do, you great blind creature: she'll accept the forgery as if it

were in actual fact her own letter; she'll never write a word, for good or for evil, to contradict it or confirm it, to any of these horrid White-strand people; she'll allow this hateful wretch Massinger to go on believing she's really dead; and she'll cease to exist, as far as he's concerned, in a passive sort of way, henceforth and for ever.'

'Will she?' Warren Relf asked dubiously. 'How on earth do you know what she'll do, Edie?'

'Why, what else on earth *could* she do, silly?' his sister answered, with the same perfect conviction in her own inbred sagacity and perspicacity as ever. 'Could she go and say to him, with tears in her eyes and a becoming smile on her pretty little lips: "My own heart's darling, I love you devotedly—and I know you signed my name to that forged letter?" Could she fling herself on these Moxies, or Mumpsies, or Mixies, or Meyseys, or whatever else you call them, and say sweetly: "I didn't run away from you; I wasn't in earnest? I only tried ineffectually to drown myself, for love of this dear, sweet, charming, poetical cousin of mine, who disgracefully jilted me in order to propose to your own daughter; and then, believing me to have killed myself for shame and sorrow, has trumped up letters and telegrams in my name, of malice prepense, on purpose to deceive you. He's a mean scoundrel, and I hate his very name; and I want him for myself; so I won't allow him to marry your Winifred, or whatever else her precious new-fangled high-faluting name may be." Could any woman on earth so utterly efface herself and her own womanliness as to go and say all that, do you suppose, to anybody anywhere?—You may think so in your heart, I daresay, my dear boy; but you won't get a solitary woman in the world to agree with you on the point for one single minute.'

The painter drew his hand slowly across his cold brow. 'I suppose you're right, Edie,' he answered, bewildered. 'But what'll she do with herself, then, I wonder?'

'Do?' Edie echoed. 'As if *do* were the word for it? Why, do nothing, of course—be; suffer; exist; mourn over it. She'd like, if she could, poor, tender, bruised, broken-hearted thing, to creep into a hole, with her head hanging down, and die quietly, like a wounded creature, with no one on earth to worry or bother her. She mustn't die; but she won't *do* anything. All we've got to do ourselves is just to comfort her: to be silent and comfort her. She'll cease to live now; she'll annihilate herself; she'll retire from life; and that horrid man'll think she's dead; and that'll be all. She'll accept the situation. She won't expose him; she loves him too much a great deal for that. She won't expose herself; she's a great deal too timid and shrinking and modest for that. She'll leave things alone; that's all she can do.—And on the whole, my dear, if you only knew, it's really and truly the best thing possible.'

So Edie took the letter and telegram pitifully in her hand, and went with what boldness she could muster up into Elsie's bedroom. Elsie was lying on the sofa, propped up on pillows, in the white dress she had worn all along, and with her face and hands as white as the dress

stuff; and as Edie held the incriminating documents, part hidden in her gown, to keep them from Elsie, she felt like the dentist who hides behind his back the cruel wrenching instrument with which he means next moment in one fierce tug to drag and tear your very nerves out. She stooped down and kissed Elsie tenderly. 'Well, darling,' she said—for illness makes women wonderfully intimate—'Warren's come back.—Where do you think he's been?—He's been over to-day as far as Almundham.'

'Almundham!' Elsie repeated, with cheek more blanched and pale than ever. 'Why, what was he doing over there to-day, dear? Did he hear anything about—about— Were they all inquiring after me, I wonder?—Was there a great deal of talk and gossip abroad?—O Edie, tell me quick all about it!'

'No, darling,' Edie answered, pressing her hand tight, and signing to her mother, who sat by the bed, to clasp the other one; 'nobody's talking. You shall not be discussed. Warren met Mr Meysey himself at the Almundham Station; and Mr Meysey was going to Scotland; and he said they'd heard from you twice already, to explain it all; and nobody seemed to think that—that anything serious in any way had happened.'

'Heard from me twice!' Elsie cried, puzzled. 'Heard from me twice—to explain it all! Why, what on earth did he mean, Edie? There must be some strange mistake somewhere.'

Edie leant over her with tears in her eyes. It was a horrible wrench, but come it must, and the sooner the better. They should understand where they stood at once. 'No, no mistake, darling,' she answered distinctly. 'Mr Meysey gave Warren the letter to read.—He's brought it back. I've got it here for you. It's in your own hand, he says.—Would you like to see it this moment, darling?'

Elsie's cheek showed pale as death now; but she summoned up courage to murmur 'Yes.'

It seemed the mere unearthly ghost of a *yes*, so hollow and empty was it; but she forced it out somehow, and took the letter. Edie watched her with bent brows and trembling lips. How would she take it? Would she see what it meant? Would she know who wrote it? Could she ever believe it?

Elsie gazed at it in dumb astonishment. So admirable was the imitation, that for a moment's space she actually thought it was her own handwriting. She scanned it close. 'My dear Winifred,' it began as usual, and in her own hand too. Why, this must be just an old letter of her own to her friend and pupil; what possible connection could Mr Meysey or Mr Relf imagine it had with the present crisis? But then the date—the date was so curious: 'September 17'—that fatal evening! She glanced through it all with a burning eye. Great heavens, what was this? 'So wicked, so ungrateful: I know Mrs Meysey will never forgive me.'—'By the time this reaches you, I shall have left White-strand, I fear for ever.'—'Darling, for heaven's sake, do try to hush this up as much as you can.'—'Ever your affectionate, but heart-broken ELSIE.'

A gasp burst from her bloodless lips. She laid it down, with both hands on her heart. That signature, ELSIE, betrayed the whole truth.

She was white as a sheet now, and trembling visibly from head to foot. But she would go right through with it; she would not flinch; she would know it all—all—utterly.

'I never wrote it,' she cried to Edie with a choking voice.

'I know you didn't, darling,' Edie whispered in her ear.

'And you know who did?' Elsie sobbed out, terrified.

Edie nodded. 'I know who did—at least, I suspect.—Cry, darling, cry. Never mind us. Don't burst your poor heart for want of crying.'

But Elsie couldn't cry yet. She put her white hand, trembling, into her open bosom, and pulled out slowly, with long lingering reluctance—a tiny bundle of water-stained letters. They were Hugh's letters, that she had worn at her breast on that terrible night. She had dried them all carefully one by one here in bed at Lowestoft; and she kept them still next the broken heart that Hugh had so lightly sacrificed to mammon. Smudged and half-erased by immersion as they were, she could still read them in their blurred condition; and she knew them by heart already, for the matter of that, if the water had made them quite illegible.

She drew the last one out of its envelope with reverent care, and laid it down side by side with the forged letter to Winifred. Paper for paper, they answered exactly, in size and shape and glaze and quality. Hugh had often shown her how admirably he could imitate any particular handwriting. The suspicion was profound; but she would give him at least the full benefit of all possible doubts. She held it up to the light and examined the water-mark. Both were identical—an unusual paper; bought at a fantastic stationer's in Brighton. It was driving daggers into her own heart; but she would go right through with it: she must know the truth. She gave a great gasp, and then took three other letters singly from the packet. Horror and dismay were awakening within her the instincts and ideas of an experienced detective. They were the three previous letters she had last received from Hugh, in regular order. A stain caused by a drop of milk or grease, as often happens, ran right through the entire quire. It was biggest on the front page of the earliest letter, and smallest and dimmest on its back fly-leaf. It went on decreasing gradually by proportionate gradations through the other three. She looked at the letter to Winifred with tearless eyes. It corresponded exactly in every respect; for it had been the middle sheet of the original series.

Elsie laid them all down on the sofa by her side with an exhausted air and turned wearily to Edie. Her face was flushed and feverish at last. She said nothing, but leaned back with a ghastly sob on her pillow. She knew to a certainty now it was Hugh who had done this nameless thing—Hugh who had done it, believing her, his lover, to be drowned and dead—Hugh who had done it at the very moment when, as he himself supposed, her lifeless body was tossing and dancing among the mad breakers, that roared and shivered with unholy joy over the hoarse sandbanks of the bar at Whitestrand.

—It was past belief—but it was Hugh who had done it.

She could have forgiven him almost anything else save *that*; but *that*, never, ten thousand times never! She could have forgiven him even his cold and cruel speech that last night by the river near the poplar: 'I have never been engaged to you. I owe you nothing. And now I mean to marry Winifred.' She could have forgiven him all, in the depth of her despair.—She could have loved him still, even—so profound is the power of first-love in a true pure woman's inmost nature—if only she could have believed he had melted and repented in sackcloth and ashes for his sin and her sorrow. If he had lost his life in trying to save her! If he had roused the county to search for her body! Nay, even if he had merely gone home, remorseful and self-reproaching, and had proclaimed the truth and his own shame in an agony of regret and pity and bereavement.—For her own sake, she was glad, indeed, he had not done all this; or at least she would perhaps have been glad if she had had the heart to think of herself at all at such a moment. But for him—for him—she was ashamed and horrified and stricken dumb to learn it.

For, instead of all this, what nameless and unspeakable thing had Hugh Massinger really done? Gone home to the inn, at the very moment when she lay there senseless, the prey of the waves, that tossed her about like a plaything on their cruel crests—gone home to the inn, and without one thought of her, one effort to rescue her—for how could she think otherwise?—full only of vile and craven fears for his own safety, sat down at his desk and deliberately forged in alien handwriting that embodied Lie, that visible and tangible documentary Meanness, that she saw staring her in the face from the paper before her! It was ghastly; it was incredible; it was past conception; but it was, nevertheless, the simple fact. As she floated insensible down that hideous current, for the sea and the river to fight over her blanched corpse, the man she had loved, the man who had so long pretended to love her, had been quietly engaged in his own room in forging her name to a false and horrible and misleading letter, which might cover her with shame in the unknown grave to which his own cruelty and wickedness and callousness had seemingly consigned her! No wonder the tears stood back unwillingly from her burning eyeballs. For grief and horror and misery like hers, no relief can be found in mere hysterical weeping.

And who had done this heartless, this dastardly, this impossible thing? Hugh Massinger—her cousin Hugh—the man she had set on such a pinnacle of goodness and praise and affection—the man she had worshipped with her whole full heart—the man she had accepted as the very incarnation of all that was truest and noblest and best and most beautiful in human nature. Her idol was dethroned from its shrine now; and in the empty niche from which it had cast itself prone, she had nothing to set up instead for worship. There was not, and there never had been, a Hugh. The universe swam like a frightful blank around her. The sun had darkened itself at once in her sky. The solid ground seemed to fail beneath her feet, and she felt herself suspended alone above an awful abyss, a

seething and tossing and eddying abyss of utter chaos.

Eddie Relf held her hand still; while the sweet gentle motherly old lady with the snow-white hair and the tender eyes put a cold palm up against her burning brow to help her to bear it. But Elsie was hardly aware of either of them now. Her head swam wildly round and round in a horrible phantasmagoria, of which the Hugh that was not and that never had been formed the central pivot and main revolving point; while the Hugh that was just revealing himself utterly in his inmost blackness and vileness and nothingness whirled round and round that fixed centre in a mad career, she knew not how, and she asked not wherefore. 'Cry, cry, darling, do try to cry,' both the other women urged upon her with sobs and tears; but Elsie's eyeballs were hard and tearless, and her heart stood still every moment within her with unspeakable awe and horror and incredulity.

Presently she stretched out a vague hand towards Eddie. 'Give me the telegram, dear,' she said in a cold hard voice, as cold and hard as Hugh Massinger's own on that fearful evening.

Eddie handed it to her without a single word.

She looked at it mechanically, her lips set tight; then she asked in the same cold metallic tone as before: 'Do you know anything of 27 Holmbury Place, Duke Street, St James's?'

'Warren says the club porter of the Cheyne Row lives there,' Eddie answered softly.

Elsie fell back upon her pillows once more. 'Eddie,' she cried, 'oh, Eddie, Eddie, hold me tight, or I shall sink and die!—If only he had been cruel and nothing more, I wouldn't have minded it; indeed, I wouldn't. But that he should be so cowardly, so mean, so unworthy of himself—it kills me, it kills me—I couldn't have believed it!'

'Kiss her, mother,' Eddie whispered low. 'Kiss her, and lay her head, so, upon your dear old shoulder! She's going to cry now! I know she's going to cry! Pat her cheek: yes, so. If only she can cry, she can let her heart out, and it won't quite kill her.'

At the words, Elsie found the blessed relief of tears; they rose to her eyes in a torrent flood. She cried and cried as if her heart would burst. But it eased her somehow. The two other women cried in sympathy, holding her hands, and encouraging her to let out her pent-up emotions to the very full by that natural outlet. They cried together silently for many minutes. Then Elsie pressed their two hands with a convulsive grasp; and they knew she would live, and that the shock had not entirely killed out the woman within her.

An hour later, when Eddie, with eyes very red and swollen, went out once more into the little front parlour to fetch some needlework, Warren Relf intercepted her with eager questioning. 'How is she now?' he asked with an anxious face. 'Is she very ill? And how did she take it?'

'She's crying her eyes out, thank Heaven,' Eddie answered fervently. 'And it's broken her heart. It's almost killed her, but not quite. She's crushed and lacerated like a wounded creature.'

'But what will she do?' Warren asked, with a wistful look.

'Do? Just what I said. Nothing at all. Annihilate and efface herself. She'll accept the position, leaving things exactly where that wretched being has managed to put them; and so far as he's concerned, she'll drop altogether out of existence.'

'How?'

'She'll go with mamma and me to San Remo.'

'And the Meyseys?'

'She'll leave them to form their own conclusions. Henceforth, she prefers to be simply nobody.'

GLACIERS.

THE primary origin of glaciers is not to be found, as is popularly supposed, in northern latitudes of the earth, but in those regions that lie nearest the equator. When knowledge on this subject was not so complete as it is now, men thought that, through ultra-boreal changes on and about the earth, the phenomenon of glaciation would be greatly increased; that northern glaciers would slowly creep down to the south, and southern ones establish themselves farther northward, while the snow-line on mountains of all latitudes would be at a much less altitude, and thus wider areas of land and ocean would permanently be covered with a cold ice-mantle.

But glaciers have their origin in heat, and not in cold, great as the paradox may appear. Twenty-three degrees north and south of the equator, the sun generates more heat than anywhere else on the globe. In these zones, where the sun's rays strike the earth almost vertically, the land becomes highly heated, and gives off much heat to the atmosphere in junction with it; the seas also absorb a large amount of heat, and radiate it into the atmospheric strata that lie upon their surface. Expanded by heat, and consequently made lighter, the substrata of air rise into the higher regions of the atmosphere, laden with an aqueous vapour, gathered chiefly from the surface of the oceans, but also in part from the moisture of the land, as well as from rivers and the wide surfaces of large inland lakes. When these vapours and air-currents reach an altitude in the atmosphere that physically admits of it, they spread themselves out horizontally, and strong air-currents, charged with vapour from the seas beneath, set out in the direction of the north and south poles. To occupy the vacuum occasioned by these upper air-currents, lower currents flow into the equatorial regions from the chilly atmosphere around the poles. Thus, a system of air-circulation is established, the equator being the pulsating heart of the whole movement.

The length of time snow remains upon the ground is mainly dependent upon altitude and latitude combined. It is obvious that above the snow-line, where more snow falls during winter-time than is thawed in the summer months, snow must accumulate to an enormous thickness. The weight of such an accumulation is beyond estimation. Snow is not, in the regions of which we

spread, spread out over a level plain, but is piled upon the steep slopes of mountain sides, and laid along the various inclines of the valleys; and through the power of gravitation, the higher fields of ice and snow press hard upon the lower ones, and the whole mass, lying upon hard rocks at various angles to the horizon, slowly moves down to lower levels. Thus, the higher regions are relieved of their crushing weight, the valleys are prevented from being filled with snow to the top of the highest peak in the range, and a glacier is born.

A glacier is constituted of two parts: that portion of it which is above the snow-line is termed the *névé*; and that part of it which reaches out into the valleys below, sometimes in winter into cultivated fields, is the glacier proper. Through the labours of Professors Agassiz and Forbes, and in later years of Tyndall, we have revealed to us many interesting facts about the motions of glaciers. In 1827, Professor Hugi of Soleure made a series of experiments upon the Unteraar glacier in the Bernese Oberland. In order to shelter himself from the bitter cold, he built a hut on one of the medial moraines; in 1830 he found by measurement that it had moved downward three hundred and thirty feet. In 1836 it had moved from its position in 1827, two thousand three hundred and fifty-four feet. In the year 1841 it was found four thousand seven hundred and twelve feet from its original position. Professor Agassiz built a place for shelter on the same glacier in 1840; and two years afterwards found it had moved downwards four hundred and eighty-six feet. These facts place beyond all doubt the motion of glaciers.

Crevasses are a notable feature on the surface of glaciers, and perform an important function. The 'regelation' theory of glaciers is, 'that the ice of glaciers changes its form and preserves its continuity under pressure which keeps its particles together. But when subjected to tension, sooner than stretch, it breaks, and behaves no longer as a viscous body.' By the sufficient application of pressure, it is possible to mould ice into any shape whatever as easily and as completely as clay: press two pieces of ice together, and immediately they mutually cohere by what is termed regelation, or in fact a kind of welding. The surface of a glacier is often covered with deep fissures, that yawn in the face of the tourist, and make travelling very difficult. Many of these crevasses are of gigantic proportions, while others are so small that a man may leap across them. In passing over uneven ground, pressure and tension are brought into play in various parts of the body of the glacier. While travelling over a hollow in its bed, the surface becomes concave; while its bottom, conforming to the rock-surface over which it is passing, has a corresponding convex form. As ice has the properties of a solid body besides behaving as a viscous one, pressure is thus brought to bear on the surface of the glacier. But in passing over a ridge, it is obvious that the surface will not be under the power of pressure, but of tension. 'Sooner than stretch, it breaks;' therefore, a crevasse in the ice is formed, and according to the magnitude of the irregularities of its bed will be the fissures of a glacier. Now, as the crevasse is stationary, and the ice is in slow motion, it follows that all ice

in the line of motion with and above the crevasse must pass over it. At the point where the tension becomes powerful enough, a huge piece of ice snaps off from that side of the crevasse nearer to the *névé*, and falls over to the other side, where, by regelation, it coheres to the solid mass, and moves down with the body of the glacier.

On the Glacier du Géant, one of the larger tributaries of the Mer de Glace, is a fine example of the formation of these crevasses. Near the juncture of the Géant glacier with the Glacier des Périades, at the foot of the Aiguille Noire, the former slowly moves over a precipice, forming a magnificent ice *cascade*. Above the cascade, which happens to be just above the snow-line, the *névé* is covered with a sheet of fine snow, which stretches, with a comparatively even surface, up picturesque valleys to the higher Alpine peaks. Below the fall, the ice is fairly smooth. But, says Professor Tyndall, 'as we approach the fall'—from the Mer de Glace—'the smooth and unbroken character of the glacier changes more and more. We encounter transverse ridges, succeeding each other with augmenting steepness. The ice becomes more and more fissured and confused. We wind through tortuous ravines, climb huge ice-mounds, and creep cautiously along crumbling crests, with crevasses right and left. The confusion increases, until further advance along the centre of the glacier is impossible.' Immediately above the cascade, the crevasses yawn terrifically; and the locality is very dangerous on account of the great blocks of ice continually falling over the precipice, and from one side of a crevasse to the other; but farther away, the snows of the Col du Géant strike the eye, an unbroken plain of white fine snow.

On the broad surface of the Mer de Glace are at least six lines of loose rubble running parallel to the course of the valley. These are termed 'moraines.' Closely examined, they are found to be composed of fragments of rock of all sizes and shape, and correspond in texture and composition with the rocks higher up the valley. These moraines range from thirty to a few feet in height, and measure various widths across the base. Their origin is easily explained. Below the *névé*, the glacier flows through valleys bounded by bare rocks, cutting a sinuous course round precipitous promontories and beneath steep cliffs, skirting the foot of acute slopes. Rain and other moisture have penetrated the faces of these cliffs during summer-time and early winter; and when the winter fairly sets in, the moisture is frozen. Frozen water expands; therefore, this ice forces open large fissures in the surface of the rocks. When the ice melts in summer-time, the cohesive element has gone, and the portions of rock, forced from their position by the insinuation of this moisture and its subsequent crystallisation, fall from their position on to the surface of the glacier. As the surface is in constant motion, every part of it becomes covered with a rough irregular fringe of this debris. This is termed a 'lateral' moraine, and it forms on both sides of a glacier.

It is of importance to note that from beneath the snout of every glacier there issues a muddy stream. This arises partly from subglacial liquefaction, and partly from surface-water that finds its way down to the glacier's bed. In winter, these

streams are reduced to dribblets; but in summer, owing to the greater waste of ice, they burst into foaming streams of considerable size. Many glaciers have large lakes upon their surfaces, and, through small fissures in the ice, water from them drains through to the rocks beneath. They are formed of the summer surface-drainage of the glacier, and occur in temporary hollows in the ice. Sometimes the course of a surface-stream of water is blocked up from various causes, when a small reservoir is formed. It often occurs that these lakes break down the temporary barriers that keep them in their beds; then the whole mass of water rushes down towards the glacier's snout, a foaming torrent, flooding every hollow, cutting a course through all obstructing surfaces, and altering the configuration of a glacier's surface in a few hours. Continuing in its wild course, the stream *below* the glacier is swollen beyond its banks by this flood, and its bed is cut deeper and wider by the turbulent waters, and sometimes wide tracts of country are flooded before the burst reservoir is exhausted. Some of the most famous rivers in the world take their rise from these glacier streams. The grand and beautiful Rhine flows from beneath an Alpine glacier; and the turbulent Rhone has a similar source. The Po and the Garonne are both glacial rivers. The sacred river of the Hindu—the broad deep Ganges, a worshipped god—is but the flowing *muscus* of a glacier's snout away in the Himalayan chain! Many other rivers also have their rise at the foot of glaciers; so that in this respect these ice-streams exert considerable influence on the countries in which they are located.

We can never gain a perfect idea of the power invested in glaciers. In weight they have great power to grind and furrow rocks over which they slowly move. A broad river gliding peacefully through a picturesque valley cuts its shingled bed lower and wider, till in the march of ages the configuration of a country is greatly altered. Before a river, rock is but clay. But compared with glaciers, rivers are impotent. A river transports mud in suspension, and along its bottom pebbles are rolled with pleasant music to the sea; but a glacier bears on its cold bosom blocks of solid rock over wide tracks of land, and its pebbles are huge boulders.

It is in Greenland that glaciers reach the maximum of their modern power and grandeur. Although, in main characteristics, Greenland glaciers and Alpine ones have great similarity, in detail and ultimate results they differ considerably. The whole of the northern continent, though mostly unexplored, is thought to be covered with snow and ice, except in places where local conditions modify climatic influences, so that the cold is somewhat less severe. Frost phenomena are so severe, that all attempts to explore the country any great distance from the coast have been attended with scanty success or absolute failure; while the more successful attempts to master the polar seas have been singularly devoid of real good, though full of arduous and romantic adventure. These boreal conditions cause great variation in the result of Greenland glaciation, as against glaciation in every other part of the world except the extreme south. The snouts of all Alpine glaciers are at a considerable elevation above the sea; but in Greenland, the glaciers

creep down to the very coast-line, and often even push themselves out along the bottom of the cold sea. Along the Greenland coast, in about sixty-two degrees thirty-two minutes north latitude, a glacier projects outward along the bottom of the sea fully a mile from the shore, forming a break-water of crystalline masonry. Some of these northern glaciers terminate at the coast-line in a perpendicular wall of ice. Professor Norden-skiöld while exploring in Greenland met with one of these walls three thousand feet in height. In the Alps, glaciers terminate by liquefaction, and deposit across the valley at the point where the glacier ceases to be, a huge terminal moraine; but in Greenland and other northern countries, where the snow-line reaches down to the sea, the glacier terminates through quite different causes, and in terminating, produces very different effects. The ice-stream does not end its course in liquefaction; but if it strikes the sea where there are cliffs of very considerable altitude, it projects bodily over the edge, until, by force of gravitation, huge pieces snap off and, falling into the sea, are floated away by southern currents into warmer climes, when liquefaction takes place. It is obvious that no terminal moraine can ever be formed under these conditions, because the debris on the surface of the glacier, as well as that frozen into its mass, is carried southward with the floating ice.

But most northern glaciers terminate through other conditions than these. Where the coast-line is a comparatively low one, the ice cuts its way down to the sea-level, and then the glacier ploughs its way along the sea-bottom for considerable distances. Thus, a submarine valley, corresponding in depth, width, and shape to the body of the glacier, is formed and occupied by the ice. Now, ice is lighter than water, and floats with about three-fourths of its body under water; therefore, if a glacier twelve hundred feet in thickness projects into deep sea-water, having only fifty feet of its surface above the waves, a great strain is felt somewhere in resisting the buoyancy of the water. If the ice be not sufficiently strong, a huge piece will snap off from the glacier's end, and immediately the laws of relative density will have free and full effect, and the detached ice will float buoyantly on the waves with about three hundred feet of its surface above water. This ideal case illustrates what really does occur; and the ice thus detached becomes an iceberg, floating steadily into the warmer waters of more southern oceans. As these bergs move southward, they continue to melt away, and the debris which they carry is deposited irregularly over the length and breadth of northern seas; yet not so irregularly as would at first sight appear, because there are certain oceanic zones in which the water reaches a higher temperature than in other localities of the sea; and when a fleet of stately bergs enter such a region they melt very rapidly, and deposit along the ocean-floor of that locality a large amount of detritus. The Gulf-stream affects the action of ice in the northern hemisphere in this manner: icebergs sailing southward from the reaches of Baffin Bay, whence most of the ice of the Atlantic proceeds, suffer comparative waste till they enter the warm waters of this stream, at which point liquefaction rapidly occurs, and the history of the berg is soon cut off; consequently, the bottom of the sea all along the northern verge of this Gulf-

stream will be covered with debris of Greenlandic rocks, and the development of this glacial drift will be of greater proportion in that specific zone than in other sub-localities of the Atlantic.

THE LOST BOND.

IN TWO CHAPTERS.—CHAP. II.

SHORTLY after the action commenced, I happened to want a cupboard in my room altered, and sent over to Mr Watkins the builder, asking him to send a man over to do the work. Accordingly, one afternoon Mr Jolly, a carpenter in his employ, made his appearance with his tools, and set to work to make the necessary alteration. He seemed to be of a talkative disposition, and after making sundry observations about the weather and relating some of the gossip of the neighbourhood, he remarked: 'It's curious in what queer places lawyers' papers get stowed away sometimes—ain't it, sir?'

'Well, yes,' I replied; 'I suppose they do get into unlikely places sometimes.'

'Yes, sir, you are right,' said Mr Jolly. 'For instance, I was doing a job at Mr Flint's the other day, and I found a document in the most unlikely place you would think of—a very important document too—in fact, a bond for a pretty large amount.'

I gave a start as the recollection of the bond in the case of Flint v. Jackson flashed across my mind. It might be that I had at last stumbled upon some information which might throw light upon the matter; so, controlling my feelings, I said, in as calm a voice as I could command: 'O yes, I suppose you mean Farmer Jackson's bond for one thousand pounds?'

'Why, sir, how in the world did you come to know anything about it?' asked Mr Jolly in surprise. 'Mr Flint told me not to mention the matter to anybody.'

'Oh, I daresay,' I said; 'but you see we do know about it; and we have reason to believe that an attempt is being made to obtain money from Mr Jackson by false pretences; and unless you tell me all you know about the matter, I shall consider you as aiding in the attempt; I must therefore ask you to tell me what you know about it.'

'I am sure I don't wish to harm Mr Jackson in any way,' said Mr Jolly. 'I thought the only reason for keeping it secret was that it was a private matter; and if it will do Mr Jackson any good, I am willing to tell you all I know about it.'

'Yes,' I said, 'it is most important to Mr Jackson, and I must ask you to tell me all you know.'

'Well, sir,' said Mr Jolly, 'you see, Mr Flint wanted some alterations made to a desk he has in his office, and among other things he wanted the drawers divided into different-sized partitions, so as to hold papers of various sizes; and I went there one morning, before any one had come to the office, to do the work. Well, I took one of the drawers out of the desk to put the divisions in, and after I had done so, I happened to look into the compartment from which I had taken it, and there I saw a document crushed up against the back, which had evidently fallen

over the end of the drawer. I pulled it out and looked over it, and found it was a bond from Mr William Jackson to Mr Sharper Flint for one thousand pounds. As I was examining it, Mr Flint came in, and I showed him the document and explained how I had found it. He took it from me and examined it, and said: 'O yes; I am very glad indeed you have found it. I have missed this bond for some time, and it might have put me to serious inconvenience if I had lost it.—Here is a sovereign for your trouble; and I should be glad if you would not mention the circumstance to anybody, as it is a private matter, which I should not like talked about.'

So far, this recital did not appear to contain anything likely to help us, but seemed rather to confirm Mr Flint's story of his having mislaid the bond; but the next sentence of Mr Jolly put a different complexion on the matter. 'You see,' he said, 'I knew that desk used to belong to Mr Winter, and when I saw his name on the bond, I thought it might be one of his papers.'

'What?' I said. 'Do you mean to say that that desk formerly belonged to Mr Winter?'

'Yes, sir,' answered Mr Jolly. 'He bought it at the sale of Mr Winter's effects. I remember the desk well, as I was at the sale when he bought it.'

This last information seemed indeed to be of a more important nature, since, if the desk formerly belonged to Mr Winter, it was possible that the bond might have been lost while it was in his possession.

'Well,' I said, 'we have reason to believe that that bond does not belong to Mr Sharper Flint at all, but that he is illegally trying to extort money from Mr Jackson on it—in fact, he has commenced proceedings against him to enforce it. Will you be prepared at the trial to swear to all that you have stated to me to-day?'

'Yes, sir; I shall be prepared to swear to every word of it.'

'Then, I shall depend on you,' I said; 'and I must ask you not to talk about the matter till after the trial.'

'Right you are, sir—mum's the word,' answered Mr Jolly; and shortly afterwards, having finished his job, he took his departure.

As for me, I hurried at once to Farmer Jackson's house at Oakfields and gave him an account of what I had heard. 'I tell you what my suspicion is,' I said. 'That bond was one of Mr Winter's papers; it was never given to Mr Flint at all; and he did not know of its existence till Jolly found it in the way I have told you.'

'That's it, sir, you may depend upon it,' said Mr Jackson, giving me a slap on the back that nearly knocked me down. 'By George! sir, we'll defeat the scoundrels yet.'

'Not so fast, not so fast,' said I cautiously. 'That is my suspicion; but I do not think it is sufficient to obtain a verdict in a court of justice. You see, we have no evidence at all that it did not belong to Mr Flint, and that it was not lost while it was in his possession. What we must do is to try to discover the whereabouts of some of Mr Winter's clerks and see if they remember anything about it. If the bond was mislaid while

it was in Mr Winter's possession, it is highly probable that some of them would have heard something about it. Rogers seems to remember very little about the matter. However, we may as well go and see him again and try and jog his memory.'

Accordingly, we went over to Rogers' house and found him in.

'Rogers,' I said, 'cannot you remember anything more about that bond? Do you remember whether it was mislaid or not?'

'Not that I heard of,' answered Rogers. 'But I have been thinking the matter over, and I think the most likely person to be able to give you information about it would be Mr Carter, Mr Winter's manager.'

'Where does he live?' I asked.

'Ah, that's the point,' answered Rogers. 'I am sorry to say I do not know. He left here when Mr Winter died, and went to London; but I don't know his address.'

'And you are quite certain you recollect nothing about it yourself?' I asked.

'Quite,' answered Rogers. 'I have been looking the matter up; and I remember now that I was ill for three or four months just about the time the bond is dated; and if anything special occurred in connection with it, I think it must have been while I was absent from the office.'

'Well,' I said to Mr Jackson as we were leaving, 'we must use our utmost endeavours to get hold of Mr Carter; but it would be as well to set to work quietly, so as not to alarm the other side. We might set a private detective to work; but it is so long ago since Mr Carter left, that there might be some difficulty in getting on the track; so I think the best way will be to advertise in a few of the London papers first; and if that fails, we can employ a detective.'

It was accordingly arranged that I should do this, and I set to work to consider the best way of carrying it into effect. I deemed it advisable not to direct any answers that might be received to the advertisement to be sent to any one in Barton; but I knew a young solicitor who was in practice in London; and after some consideration, I concocted the following advertisement:

'Will Mr Carter, who formerly resided at Barton, kindly communicate with Mr Edward White, Solicitor, Bell Yard, Doctors' Commons.—By doing so, he will greatly oblige.'

I inserted this advertisement in two or three of the London papers; and was extremely pleased, a few days afterwards, to receive a letter from Mr White, stating that Mr Carter had called on him with reference to the advertisement; that he was with a firm of solicitors in the City, and would be happy to see me and give me any information in his power.

As may be conjectured, I lost no time in running up to town and calling on Mr Carter. I found him to be a frank, gentlemanly man, of prepossessing appearance, who willingly told me what he knew of the matter. I informed him of the action taken by Mr Flint, and the circumstance of the finding of the bond by Jolly, and asked him if he could throw any light on the matter.

'Well, yes,' he replied; 'I remember that bond very well—in fact, it was I who drew it. Mr William Jackson intended borrowing a thou-

sand pounds from Mr Sharper Flint, and gave us instructions to prepare the bond. He called in and executed the document; but told us not to part with it until we heard from him again, as he had not quite made up his mind as to whether he would borrow the money. Mr Winter accordingly placed the bond in his drawer. A few days afterwards, we received a letter from Mr Jackson saying that he had determined not to borrow the money, and asking us to destroy the deed. Mr Winter searched through the drawer for the bond; but, to his surprise, it was nowhere to be found. We searched through the office high and low, but could find no trace of it; and as far as I know, it was never discovered.'

'Thank you very much,' I said. 'That explains the whole matter; and if we may rely upon your assistance at the trial, I think we shall have no difficulty in substantiating our defence.'

'Oh, certainly. I shall be happy to render you any assistance in my power,' said Mr Carter; and having again thanked him for his information, I took my departure.

We succeeded in unearthing two or three more of Mr Winter's clerks, who remembered the circumstance of the bond being lost and an unsuccessful search being made for it. Having now something definite to go upon, I set to work with a will, and pleadings and affidavits and notices followed one another, till the papers began to accumulate on my table in a manner dear to every lawyer's heart. Mr Jackson's neighbours, however, shook their heads rather doubtfully when they heard that he had intrusted his case to me. Mr Flint was a sharp man, they said, and so was Mr Crawley; and it was not likely that a young solicitor like myself without experience could be a match for them.

The longest pleadings must come to an end some time, and eventually we 'joined issue,' and notice of trial was given, and I began to prepare my first brief. How hard I worked at it, and what affectionate care I lavished upon it! I thought of it by day and dreamed of it by night, and consulted every book and case bearing on the subject I could lay my hands on; and when at last it was completed, and fairly written out on brief-paper, I considered it to be a work of art.

The trial was fixed to take place at the next assizes in the neighbouring town of Leighton; and you may be sure that I and Mr Jackson and our witnesses were there in good time. After some other cases in the list had been disposed of, the case of Flint v. Jackson was called on. Mr Elsdon, Q.C., and Mr Sefton appeared for the plaintiff; and Mr Herbert, Q.C., and Mr Lumley for the defendant. Mr Elsdon opened the case on behalf of the plaintiff. He stated that the action was brought to recover the sum of one thousand pounds, advanced by Mr Sharper Flint to the defendant, Mr Jackson, for which the bond in question had been given. Mr Elsdon here produced the bond, which our counsel, after examining, admitted. Mr Elsdon continuing, stated that the money due on that bond had never been paid, and as the document was admitted, he did not see what defence there could be to the action, and he would therefore not waste the time of the court by any further comment, but would

at once call upon the plaintiff to give his evidence. Mr Flint thereupon stepped into the witness-box and swore that he had advanced Mr William Jackson the sum of one thousand pounds, on the security of the bond which had been produced—that that sum had never been repaid to him, but that the whole of it was still due and owing. Mr Herbert cross-examined him pretty sharply as to whether the money had actually been advanced, and as to how he got possession of the bond; but he stuck to his story, and stepped down from the witness-box with his evidence unshaken.

Mr Herbert addressed the court on behalf of the defendant. His learned friend, he said, had stated that he did not see what defence there could be to the action; but if that were so, he was afraid the plaintiff had not been so frank with his legal advisers as he should have been. On the contrary, he considered that we had a perfectly good defence to the action, and he hoped to prove not only that the money had never been advanced, but that the bond had been obtained by fraud, and that Mr Flint had no right to it whatever. He then called Mr Jolly, who explained the way in which he had found the bond; and also swore that the desk in which he had found it formerly belonged to Mr Winter, Mr Jackson's solicitor. The plaintiff's counsel apparently did not think much of this evidence, and allowed Mr Jolly to step down without any cross-examination. Mr Carter then stepped into the box, and stated the circumstance of the bond having been prepared by him while he was in Mr Winter's employ, of the letter from Mr Jackson stating that he had determined not to borrow the money, and requesting Mr Winter to cancel the bond, and of the unsuccessful search for that document. He also stated that, as far as he knew, the bond had never been found. The plaintiff's counsel evidently thought this more serious, and subjected Mr Carter to a rigorous cross-examination, but failed to shake his evidence in the slightest degree. Two or three more of Mr Winter's clerks confirmed Mr Carter's evidence as to the bond having been lost; and Mr Jackson deposed that he had been through his father's books and papers and found no trace of any such sum having been borrowed, and that his father had consulted him some years ago as to borrowing a sum of money from Mr Flint, but had afterwards stated that he had determined not to do so.

Mr Herbert, again addressing the court on behalf of the defendant, submitted that the evidence which he had adduced proved that the money had never been advanced, and that the bond had never been given to Mr Flint. Mr Elsdon replied on behalf of the plaintiff, and endeavoured to make light of the evidence which had been given.

The learned judge shortly summed up the case for the jury. He stated that the question for them to consider was whether the money claimed had ever been advanced by the plaintiff to the defendant, or whether it was a fraudulent claim on a bond to which the plaintiff had no right, in which latter case they were to find for the defendant. The jury then retired to consider their verdict.

I had been so interested in watching the case, that I had noticed nothing else, but I now looked

towards the place where Mr Sharper Flint had been sitting, and found that he had disappeared. In a few minutes the jury returned to the court, and amid a profound silence the clerk of the court asked them the usual question: 'Gentlemen of the jury, are you agreed upon your verdict?'

'We are,' answered the foreman.

'Do you find for the plaintiff or the defendant?'

'For the defendant.'

I heaved a sigh of relief; and happening to look behind me, saw Farmer Jackson, the anxious expression which he had worn lately gradually giving way to his old look of good-natured contentment.

The judge having ordered the verdict to be entered for the defendant, expressed an opinion that Mr Flint ought to be prosecuted for fraud. Accordingly, as soon as I left the court, I obtained a warrant for his apprehension; but we were too late, for we found that he had absconded, taking with him all the money and portable securities he could lay his hands on. We traced him as far as Mudford, a junction about thirty miles from Barton; but there we lost all trace of him. However, he left ample property to satisfy all his creditors, so nobody was a loser by his flight.

Since that time, I have had no reason to complain of want of practice, as the case brought my name prominently before the notice of the public, who were pleased to give me more credit for the successful result obtained than I perhaps deserved. They were confirmed in this opinion by my friend Mr Jackson, who lauded the way in which I had conducted the case, and attributed no small part of his success to my efforts. He and I continue excellent friends to this day. He generally contrives to run up a moderately long bill every year, and a few days after I send it in, he calls on me with a cheque for the amount, and we have a chat over old times.

LEOPARDS AT HOME.

BY AN OFFICER'S WIFE.

MANY people spend a great part of their lives in India without seeing anything of the wild beasts and snakes with which it abounds. My experience was very different. I passed only a few years in the country; but I happened to come frequently in contact with its savage denizens, and among other adventures I had several opportunities of viewing leopards in their wild state.

Before the beautiful Himalayan sanatorium of Dalhousie had increased to its present proportions it consisted chiefly of a girdle of habitations clustering round the Bukrota, or lower hill, and a few scattered houses dotted about on the higher mountain, Terah. One of these latter we took for the season by advertisement without having seen it; and I was somewhat dismayed, on arrival, to find how lonely and exposed the situation was. However, the magnificent view of the snowy range from the veranda consoled me, and I quickly set to work to make the bare rooms as habitable as possible. 'I fear few of our friends will take the trouble to mount up to this eyrie to visit us,' I lamented. But the very next evening we were to have a visitor we little desired.

In an Indian bungalow every bedroom has a small anteroom attached in which the important function of bathing is performed. The floor is of cement and uncarpeted, to allow of splashing; and round the tub are placed the *ghurras*, or earthen pots of water which are required for the bath. The little room has always two doors, one opening on the outer air, to admit the bheesti with his supply of water; the other opening into the bedroom. On the evening in question, just as dusk was falling, I had finished the unpacking of a box in my bedroom and was moving away, when I fancied I heard a slight sound in the bathroom. It was an unusual hour for the bheesti's visit, so I opened the door, and, to my horror, saw just in front of me the beautiful sleek back of a large leopard, which was crouching on the floor and drinking out of one of the *ghurras*. The room was so small that I found myself quite close to the leopard, and could indeed have touched the spots on its glossy coat from where I stood. I was too frightened to move, and stood perfectly still; and fortunately for me, the outer door by which the creature had entered still stood wide open, and with a single bound, it cleared the threshold and disappeared up the hillside. Had the door blown to, or been closed from the outside by a servant, the animal would have had no resource but to seek an exit by the doorway in which I was standing, and the knowledge of my narrow escape made us very careful ever after about shutting up early in the afternoon.

A few nights later we were wakened by hearing the watchman call out loudly that there was a leopard in the veranda; and we ran to the window in time to see the waving of the branches where the beast had sprung out among the trees. The bearer, who was lying rolled up in his blankets in the same veranda, slept soundly on meanwhile, unconscious of his proximity to the stealthy-footed creature. These leopards are cowardly creatures, and will never attack a human being if they can avoid it; their special fancy is for little dogs; and they will so haunt the neighbourhood of any house where dogs are kept, that the greatest care is necessary to prevent the little quadrupeds falling victims to the big ones.

As the weather became better, they grew less bold, and it was only towards the end of the season that we saw them again. When snow fell on the farther hills they were driven to seek food lower down, and then again they began to infest the station. Often in the month of October, when coming home late at night, I have heard the hoarse sort of purring noise they make as they rub their sides, like huge cats, against the trunks of trees. The men carrying my *dandi* (light palanquin) would then step out, and talk very loud, to keep up their courage, while the mate would flourish his lantern and shout. No leopard would come near so noisy a party; and the only danger on such occasions is of the men taking a panic and dropping the *dandi*, when the situation would be awkward. This, however, never happened to me; and I was equally fortunate when riding.

One evening we were riding quietly home in the short gloaming, when a large animal jumped from the jungle above into the road close in

front of us. It ran swiftly along the road for a short distance, and then disappeared. My companion advised that we should hurry a little, as our horses seemed uneasy, so we trotted on; and when we came to the spot where we had lost sight of the leopard, there it was lying on the outer edge of the narrow mountain road, its eyes blazing like green lamps in the dusk, and its body half hidden in the grass and shrubs. I was mounted on a small pony, and could not help fearing the wild beast might spring upon us as we had to pass so close to it; but it lay quite still. When we had passed, I looked anxiously round, and saw it rise and walk off calmly into the underwood. My companion assured me the real danger was not from any onslaught on the part of the leopard, but lest our horses should take fright and bolt with us along the narrow path in the uncertain light.

On another occasion we were not so fortunate. I had been to a picnic luncheon with some friends in a glade near the lovely valley of Kujiar. We walked back, having our dandis carried behind us; and when dusk began to fall we put the dogs which had accompanied us into the dandis, knowing it was no longer safe for them to run by our side. At length one lady became tired, and called for her *dandi*. It was brought, and set down for her to enter. As it touched the ground, the little dog jumped out to welcome his mistress; but in a moment his pretty gambols were cut short. Like a flash, a great creature sprang into the road, and snapping up poor little Prim, vanished with the rapidity of thought down the steep hillside. We felt thunderstruck, and stood for some moments in horrified silence, gazing down into the bushes where the gliding form had disappeared; but nothing was to be seen or heard. The elastic tread of the leopard left no sign or track; and so noiselessly had it passed, that we could not tell whether it had slipped at once to the bottom of the ravine, or whether it was then lying only a few feet below us, hidden in the brushwood. The latter we imagined to be the case from the sudden silence that fell upon the other dogs, which, instead of whimpering as before and rebelling against their imprisonment, now cowered, mute and terrified, in the cushions of the several dandis. Poor Prim must have been killed by the first clutch of the cruel claws, for he never uttered a single cry. We hurried home, grieving much over his dreadful fate, and the gentlemen of the party immediately returned to the spot with their rifles and beaters; but nothing was then to be seen of the leopard.

Shooting-parties were frequently organised about this time; but they were not often successful, owing to the dense jungle that covered the slopes, and the impossibility of following the quarry even when sighted. The best chance was for a solitary sportsman to spend a night in a tree; but the leopards, though so bold in seeking their prey under safe circumstances, were extremely cautious when danger was at hand, and would generally leave the bait untouched near which their unseen enemy lurked. Traps, too, were placed on a low spur towards Bukloh, which they were known to frequent; but very few were caught there that year.

I will conclude with an exciting ride experienced by a young police-officer, who, being

suddenly summoned to investigate a case at a village some miles from the station, started off on his stout hill-pony, accompanied by his favourite large retriever. After going a short distance, he noticed that the dog, instead of running about as usual, was keeping close to the pony's heels; and from a continuous rustle in the vegetation along the side of the road, he soon perceived that a leopard was keeping pace with them. Having no weapon but a hunting-crop, he could take no offensive measures; but calling to the dog, he induced it to keep close below the girths on the side farthest from its foe. The dog seemed quite to understand the position, and never abandoned the shelter thus formed; and thus the village was reached in safety, though the leopard, which was evidently hungry, only relinquished the pursuit when the mud walls surrounding the little town were actually entered. Both horse and dog were much fatigued by the long race along the steep hill-road, the rider having been afraid to slacken pace for a moment lest the leopard should thus have time to make a spring. He was a patient and persevering leopard, and doubtless dined well that night, though not, I am glad to say, on our friend's fine retriever.

IN A TURKISH CITY.

THIRD PAPER.

It is a sweltering hot day, one of the first hot days of the early spring. Yesterday, the rain was descending in torrents, and the greater part of the street was a watercourse, but to-day all the clouds have cleared off, the sun is shining fiercely; and as a consequence of yesterday's rain, the roads and streets are delightfully clean. Not that it matters much to me what the roads are like, for I must perforce remain in to-day to receive visits, as it is the feast of Easter, and all the notabilities of the town will file in and out of my little cottage all day long, exchanging compliments, and imbibing vast quantities of my tobacco-smoke and coffee. I was up early this morning; but the natives were too many for me, and I had to eat a hurried breakfast between relays of Christian merchants, all shy and silent, all in their best clothes, and all, as I know only too well, with prospective axes to grind.

I had a cessation during the hour of the high celebration at the Roman Catholic cathedral; but the end of the function was all too soon announced by another caller. I hear him stumbling up the staircase, and then Achmet opens the door, and shows in the son of one of the principal Christian merchants who visited me this morning. At first I hardly recognise the youth, he seems so utterly changed, and, what is rather unusual on his part, looks rather ashamed of himself. A couple of months ago he returned from Venice, where he had been educated, determined to comport himself in everything like a European. He then wore a short cutaway coat, trousers very tight in the leg, and very loose round the ankle, a shirt-collar cut half-way down his chest, and a billycock hat with a very narrow brim on the top of his bushy curls. He was more European than the Europeans in those early days, and spoke of his compatriots as *questa gente*, and affected the airs and graces of the modern Italian youth. But alas!

the ridicule of his friends and relations has changed all this, and he now presents himself before me in a short scarlet jacket embroidered with black silk, and so tight in the arms and back that he can hardly stoop. An enormous pair of dark calico knickerbockers covers his person from the waist to the knee, while his lower extremities are clothed in white cotton stockings and elastic-sided boots. On his head is balanced the flat red fez with its heavy blue silk tassel; in fact he has taken advantage of the Easter festivities to put on the garb of his race and class, and to discard the Frankish dress he once held so dear. He notices my ill-concealed look of astonishment, and excuses himself somewhat awkwardly for resuming the national dress, by no means making the matter better by saying that he did not come with his father that morning because we who have lived in Europe do not care for such early visits, and he thought that he could converse more freely without the presence of *questa gente*. He makes these remarks proving his superiority to the rest of his race in good Italian, and as a still further proof, after a few false starts, continues his remarks in French.

I had noticed when he entered that he seemed to be walking as if he had peas in his boots, and he presently volunteers an explanation of this unfestiveal-like state of things, by observing: 'Je ne puis pas chaminer beaucoup; mes bottes sont trop strettes.' He smiles feebly as he confesses to his vanity, and wipes his hands nervously with a red cotton handkerchief after the manner of his kind.

The conversation languishes while he is composing a fresh atrocity in French; and I am almost in despair of getting rid of him, when a sudden martial clanking strikes upon our ears, the great double gates are thrown wide open, and the Vali Pasha of the vilayet stalks into the little courtyard, surrounded by his staff. At the sight, my pseudo-Frankish acquaintance starts to his feet unmindful of the tightness of his boots, and crushing his half-smoked cigarette—the fourth or fifth—into the brazen ashpan, declares he must be off now, as he has so many calls to make, and escapes just in time to salaam to the pasha in my little entrance hall.

Achmet, with an air at once consequential and deprecatory, bows in the Vali Pasha and his followers, and then, bustling about the room with his peculiar cat-like tread, contrives to get rid of the old cigarette ashes in some mysterious way, and places a clean ashtray by each guest. As the Vali Pasha enters, I step forward to greet my guest upon the threshold and lead him to the seat of honour, at the same time begging his suite to seat themselves. While the faithful Achmet is making a fresh brew of coffee, let me try to describe my visitors.

The governor-general, Hussein Pasha, is a tall, thin, gray-haired old gentleman, who has seen service in the Crimean and other wars. I say 'gentleman' advisedly, for everything about him, from his small and well-kept hands and his carefully trimmed gray beard, to his shapely and well-shod feet, shows him to be a polished, well-bred Turk of the best school. No one can be more courteous in his manner, or more happy and unconventional in the compliments he pays. He speaks no language but his own, not even

French; and those who know the Turk will agree that he is all the better for that ignorance.

Riza Pasha, his second in command, is a very different man. Tall and stout, his handsome face has the appearance of belonging to one who is always struggling against sleep, and who only keeps awake out of deference to his companions. He speaks English fluently in a soft fat voice, and is a man of some wealth and influence. In the late wars, he commanded a battalion; and the Dalmatian doctor who accompanies him to-day is fond of making sneering remarks—behind his back—about the general's courage.

The third pasha is completely unlike the other two. He is very short, and has the reputation of being a brave man, nor is he at all loth to blow his own trumpet upon all and every occasion. But what chiefly distinguishes him is that he is certainly the ugliest, and probably the vainest man in the whole city. He also speaks English with great facility, having spent three years in London learning mining engineering. After mastering this subject, he returned to Constantinople, where he was promptly commissioned by the government to translate an English medical work into Turkish. Beyond this, his English and mining knowledge have done him no good, except that the former has enabled him to prove himself a jovial companion to every Englishman he meets.

The other two are interpreters; one of Corfiote extraction, and the other the Dalmatian doctor mentioned above. Both speak French, Italian, Turkish, and Greek with equal facility, and, what is more, think in any one of these languages indifferently. The Corfiote has no special characteristics except a way of looking stealthily out of the corners of his eyes, and a very heavy moustache. The Dalmatian is a fine tall handsome man, who has attached himself to Hussein Pasha as a sort of unofficial interpreter, and is fond of making a butt of the third pasha, whose name is Hakki, upon every safe opportunity.

But now the trusty Achmet enters, and with his right hand upon his heart, presents the tray bearing the cups of fragrant coffee. We all six lay aside our cigarettes for a moment and sip the steaming liquor out of the tiny cups. As I have to drink a cup of coffee with each relay of visitors all through the day, my gratitude to the man who invented little cups is only equalled by my detestation for the miscreant who made it a rule of etiquette that the host should drink coffee or sip sherbet every time a fresh jorum comes in for his guests. Under the influence of coffee, the first stiffness of our intercourse wears off, and the doctor begs the Vali to tell Hakki Pasha to show me how they preach sermons in England. Hakki looks somewhat disconcerted, and the Vali is too much of a gentleman to press him; but the doctor, who has no such scruples, tells me in French—translating into Turkish, for the Vali's benefit, as he goes along—that Hakki Pasha sometimes at the Konak gets upon a chair and preaches a sermon that he once heard in England condemning all Turks, Jews, infidels; and heretics to everlasting punishment—the point of the story of course being the placing Turks and infidels in the same category. The doctor is a Christian of some nondescript kind himself, but in Mohammedan

society is more Turkish than the Turks. The Vali hastens to turn the conversation, and says: 'Tell the English Bey, Hakki Pasha, how they gave you sugar in England!'

Hakki's little eyes light up with the spirit of fun, and he begins at once, screwing up his caricature of a face, and acting every part of his recital; while the Vali Pasha, who has heard the story a hundred times before, follows it in the unknown tongue, and nods approval at the right places, which are vividly indicated by the narrator's wonderful gestures.

'When I was in England learning engineering,' says Hakki Pasha, 'I was in a boarding-house near the school, and the landlady was very mean with the sugar. You know we in the East like a good deal of sweet, and so, when she sent me my cup of tea with only two lumps of sugar in it, I used to send it back and ask for more. Then she would search out the smallest lump of sugar in the basin, and hold it out to me between her finger and thumb'—suiting the action to the word, and looking with head on one side and screwed-up eyes at his finger and thumb, which he pinched together as tight as possible, to indicate the very smallest piece of sugar—'she used to hold it like that, and say, "Is that too much for you, Hakki Bey?"'

As he reaches the cream of the joke, we all laugh, not loudly or uproariously, but in a dignified and subdued manner, as people who have heard the story before, and hope to hear it again, and the little pasha says: 'That is how they give you sugar in England!'

Since exchanging compliments with me on entering, Riza Pasha has not uttered a word, and now he only smiles sadly and continues an admiring inspection of his varnished boots between the puffs at his cigarette. The Corfiote, after some conversation with his chief, informs me that the Vali has lately procured some wonderful new fishing-tackle from England and is anxious to try it. He knows that all Englishmen catch fish, and so begs the favour of my accompanying him upon his fishing expedition. He enlarges upon the excellence of his new tackle, till at last Hakki Pasha, not to be outdone, says: 'I often catch fish; but my way is quicker and catches more fish than His Excellency's'—at the same time pulling two or three little cartridges out of his capacious coat pocket.

'What is that, *effendim*?' says the Corfiote.

'Dynamite,' replies Hakki cheerfully, slipping the cartridges back into his pocket. 'I catch plenty of fish with them!'

I confess to feeling uncomfortable. I should not have been so amused at that sugar story if I had known that the little poacher had dynamite cartridges shaking about in his great pockets, and murdered fish in so unsportsmanlike a manner.* Moreover, he has already burned two holes in his coat sleeve, and made a horrible odour by smoking his cigarette so short that it singed his moustache; and there is no knowing what the next burning stump may set fire to. However, no one stirs. If it is written in the Book of Fate that

* Perhaps this nefarious accomplishment of Hakki's was acquired as part of his mining education in England, it being well known to anglers that in Scottish rivers, and probably in English ones too, dynamite is so used by some miners.—Ed.

we are to be destroyed to-day or to-morrow, it is useless our attempting to prevent it. I can see that the two interpreters do not like the dynamite any more than I do; but they say nothing, knowing that any remark would probably make the pasha do something foolish out of bravado. I am not sorry when the Vali rises to take leave; and as I accompany him to the door, he presses me to come on a fishing expedition in the course of the week. I accept with the mental reservation to keep as far from Hakki Pasha and his malpractices as possible. The Turkish soldiers, who have been chatting, smoking, and drinking coffee with Achmet down below, spring to 'attention;' and so, with many parting expressions of friendship, the pasha and his suite clank out of my little courtyard, and leave me to await the arrival of fresh visitors.

DEATH-TRAPS.

It is high time that the truth about drain-traps, or, as we have called them, 'death-traps,' were told in unmistakable language. In the first place, 'trap' is a misnomer, except in the sense that it catches the unwary, or those without experience in sanitary engineering. Call it a siphon if you like, since it is merely a vertical bend in a pipe where water will collect; or even a water-lute or hydraulic seal; but not a 'trap,' since the poisonous gas that gets into it on the one side escapes on the other—not quite one's idea of a snare. In the next place, far from forming a safeguard against the presence of sewer-gas in our homes, these so-called traps are the means of spreading broadcast in them those deadly germs that occasion suffering and death. A siphon even, when kept always full, is but a slight security, since gas will pass through the water by absorption in dangerous quantities, escaping through any crack or flaw that may exist in the pipes within. Water absorbs gas under pressure, or, in other words, becomes impregnated with it; and will consequently, in any form of trap, give it off on the side not under pressure—the house side.

A trap has no business *inside* a building. Another monstrosity is the ventilating pipe from the main, to say nothing of its hideousness, and which as often as not pours its fever-laden breath through attic and dormer windows or down chimneys. It would really seem in some cases as if the sewer-gas were bottled up simply as an excuse for erecting one of these unsightly appendages, and so to deceive the uninitiated, who when looking over a house at once exclaim: 'One point in its favour is that the drains are all right, for, look! there is the ventilating pipe.'

It only remains to explain the remedy, which, we believe, emanated from Mr Norman Shaw, R.A. In place of the usual advice, 'See that the drains of your house are properly connected with the main,' we would say, 'See that they are disconnected from it.' Fix a four or six inch iron pipe in some convenient position against the outer wall of the house, reaching from the basement right up to the eaves. Leave both ends entirely open. Into it lead, by the shortest route, but avoiding sharp turns, all the pipes from water-closets, baths, sinks, &c., as well as the overflow pipe from the cistern. Let this iron pipe do duty

also as the down-pipe for rain-water, leading the roof-gutters so as to discharge into its upper end. Let the lower end discharge through a movable grating into a small cemented chamber, and directly over the mouth of an earthenware pipe, through which the contents will flow into the main drain. Some three or four feet from the chamber, between it and the main, insert an earthenware siphon, so as to bar to some extent the passage of gas from the sewer. There will be a constant draught through the main pipe, owing to the air above moving at a greater velocity than that below. The atmosphere is always in motion, even in the most secluded valleys and the narrowest lanes of cities: it never moves at a less speed than a foot and a half per second.

By doing away with traps, we at once get rid of the numerous sources of danger and annoyance occasioned by their use. It is well known that when two or more water-closets are built one above the other—all discharging into the same soil-pipe—the traps of the lower ones are liable to be emptied of water, unsiphoned, by the rush of water from above acting like a piston, making suction behind it, thus opening up direct communication with the main drain. Unoccupied houses no longer suffer from disused traps becoming emptied by evaporation. We get rid of the many little accumulations of water more or less polluted, which are dotted all over the house. Expensive and intricate articles of sanitary pottery, always somewhat complicated and getting out of order, are unnecessary. The frequent chokings, especially in large barracks, hospitals, and asylums, are unknown. And lastly, we are not made to suffer for any carelessness or scamping of the plumber's work.

Nature in all her workings is beautifully simple, and the more nearly we imitate her in our endeavours to assist her, the more satisfactory will be the result. The golden rules in drainage are—(1) Let the system be simple. (2) Let it be as much exposed and as easily got at as possible. (3) Never bottle sewer-gas.

TRIOLETS.

WE used to watch the white moon's car,
And count the twinkling stars together;
We used—alas, the days are far—
We used to watch the white moon's car!
There must have risen a baleful star,
For now I sigh, in changed weather;
'We used to watch the white moon's car,
And count the twinkling stars together.'

'Twas but a dash of autumn rain
The wet wind from the west was blowing;
It seemed like tapping on the pane,
'Twas but a dash of autumn rain.
Up in my heart hope sprang again,
And set long deadened pulses glowing—
'Twas but a dash of autumn rain
The wet wind from the west was blowing.

LONDON STONE.

FEW people, probably, have ever seen London Stone, and it is safe to say that many are even unaware of its existence above ground. Cannon Street is not the locality in which one would look for antiquities, whatever Candlewick Street may have been. The changes made after the Great Fire—when the street was levelled, and with it most of the steep water-side lanes—and the revolution of 1847 have made it almost impossible to realise the lie of the ground. Mansions, we know, once stood on the banks of the Walbrook; and Cannon Street was once the most fashionable of the City thoroughfares. It stood high, although it was not the highest ground within the walls, if we can believe the quaint distich on the figure in Pannier Alley: 'When you have sought the City Round, Yet still this is the highest ground.' But the boy with the bunch of grapes dates only from 1688—twenty-two years after the Great Fire; and it is at least possible that before it was levelled by Sir Christopher Wren, the roadway by Cannon Street Station was one of the finest sites in the City, and that any prominent landmark placed here would be visible from the rising ground outside the walls. Here stood London Stone. Its sole remaining fragment, a cubic foot of oolite, is built into the wall of the church of St Swithin and St Mary Bothaw, in a niche protected by an iron grating.

The relic is seldom noticed, even by the most inquisitive of country cousins. During the greater part of the year, a fruit-stall largely obscures it from the public view. Hanks of twine are twisted round the iron grating, and on the Stone itself rest piles of paper bags. The combined effects of smoke and dirt, weather and wear, are telling upon it to such an extent that there seems to be some danger of its disappearing altogether; and the fact possesses for the superstitious an ominous significance. For London Stone shares with the Stone of Scone a venerable tradition. Everybody knows the Scotch superstition, that wherever the Stone brought from the Abbey of

Scone, and now in Edward's Coronation Chair in Westminster, is, there will the Scots be supreme. Regarding London Stone there is likewise an old saying to the effect, that 'so long as the stone of Brutus is safe, so long shall London flourish.' London Stone has already passed through so many vicissitudes, that there is reason to hope it will survive for some little time to come, so that there is still hope for the prosperity of the metropolis.

The Stone stood formerly, if not originally, as to which we know little, on the south side of the street, and there it remained down to the middle of the eighteenth century, when it was moved to the north side and placed close to the kerb. Fifty years later it was condemned as 'a nuisance and obstruction,' and only escaped being destroyed in consequence of the enterprise and energy of Mr Thomas Maiden, a printer of Sherborne Lane. It was, it seems, owing to his initiative that it was encased within another stone and set back against the wall of the church. But even in this position it was not allowed to rest in peace; and not until it was built into the wall did the outcry against it subside. The monument has dwindled in size until it is little larger than a paving cobble; and if its vestiges are to be preserved, it is high time that more care was bestowed upon its guardianship.

London Stone appears more than once in history. Myth and legend apart, there is plenty of evidence to prove that it once possessed a curious importance. We may perhaps look askance at the tradition which declares it to have been brought from Troy by Brutus, and laid by him on the altar of the Temple of Diana. There is much that is apocryphal about the story that it is the veritable stone on which the British kings took the oaths on their accession. It may even be doubtful whether this is the real palladium of London, notwithstanding the old proverb. But we have no need of legendary lore to show that the stone dates back to a long antiquity. Saxon charters speak of it in terms of respect, if not of veneration. The manuscript gospel book

given to Christ Church, Canterbury, by Athelstan, refers to it as a well-known landmark. Every one remembers that half London was burned in the first year of Stephen, and the chroniclers record, as if of course, that this first broke out in a house 'near London Stone,' so that it must then have been one of the lions of London. Henry FitzAlwyn, again, the famous and first mayor of London, was popularly known as 'the draper of London Stone;' and Lydgate in the *London Lackpenny* relates how he 'went forth by London Stone throughout all Canwick Street.' There is, too, no reason to doubt that this is the Stone on which Jack Cade, after he had stormed London Bridge, struck his bloody sword, exclaiming: 'Now is Mortimer lord of this city'—a story for which Shakespeare is as high an authority as Holinshed, and which seems to show that the Stone was at that time still popularly associated with the government of London. It is also clear that it had come to be one of the recognised places for the promulgation of edicts at the latter end of the sixteenth century. 'Set up this bill at London Stone. Let it be doone solemnly, with drom and trumpet; and looke you advance my collour on the top of the steeple right over against it'—runs a passage in *Pasquil and Marforius*. And again we read: 'If it please them these dark winter nights to sticke uppe their papers uppon London Stone'—from all of which it appears that in those days it fulfilled functions which were a little later discharged in most places, as they still are in some, by the town pump. That it was once of considerable size, we know from Stow, who describes it as in his day 'pitched upright, a great stone fixed in the ground very deep, fastened with bars of iron, and so strongly set, that if carts do run against it through negligence, the wheels be broken, and the Stone itself be unshaken.' Sir Christopher Wren, too, who examined its foundations during the rebuilding of Cannon Street after the Great Fire, gave it as his opinion that it had once been a considerable monument.

From all this, it will be seen that London Stone from Saxon times down to the middle of the last century needed no apologist; whatever its original purpose, it filled through all these centuries a place of no little honour. The theory that it was formerly the *milliarium*, or milestone, from which the Roman roads were measured, has nothing improbable in it. From its present position, which is only a few yards off its earlier and presumably original site, it stood in the middle of Watling Street, which ran through the City from Ludgate along the present Watling Street and Budge Row to the Walbrook, which it crossed by a bridge, and then branching off by London Stone, continued along the Langbourne to Aldgate. And whether, as believed, the Stone was close to one of the gates in the western rampart of the citadel, it may well have been taken as a leading landmark on the great highway, if it was not, as Camden considered, the great central milestone. It may, indeed, have been originally a pillar set up in the centre of the Forum of Agricola's station. There is a similar stone of the time of Hadrian, which was found on the side of the Roman fowsway near Leicester. But adjoining its foundations, when these were unearthed after the Great Fire, were discovered some tessellated pavements and other

extensive remains of Roman buildings. These seem to show that it must have once been more than a mere pillar, like the *milliarium aureum* erected in the Forum at Rome by Augustus. The central landmarks common in Roman cities were of very various form. At Constantinople, for instance, the *milliarium* was an 'eminent building' with many statues; so that, although the records are silent, the fragment of oolite which is now preserved, after a fashion, in the wall of St Swithin's Church may have been part of the central pillar of some massive building in Roman times. As to its dating farther back still, we have nothing to guide us, for here all is conjecture. It is, of course, perfectly possible that the Romans found the Stone there, and utilised it after their own fashion. They were, we know, quick to make the most of the labours of the Britons: many a famous highway was British before it was Roman. Watling Street itself was a forest lane in British times. The Romans widened it, and made it part of their grand route from Kent to the Severn. There is, it is true, some reason for thinking that the track originally did not enter the city at all, but, following the line of the Edgware Road, crossed the Oxford Road at Tyburn, and then ran, by way of Park Lane and Mayfair, on through St James's Park until it crossed the Thames by Stanegate Ferry. It was, according to this view, only diverted so as to pass through the city after London had become a place of importance, and possibly after the building of the first London Bridge; and this was certainly not before the Roman occupation. But whatever its origin may have been, there is no manner of doubt that London Stone possesses claims to be preserved which require no superstitious or sentimental sanction.

THIS MORTAL COIL.

CHAPTER XVIII.—COMPLICATIONS.

ELSIE spent a full fortnight, or even more, at Lowestoft; and before she vacated her hospitable quarters in the Relfs' rooms, it was quite understood between them all that she was to follow out the simple plan of action so hastily sketched by Edie to Warren. Elsie's one desire now was to escape observation. Eyes seemed to peer at her from every corner. She wanted to fly for ever from Hugh—from that Hugh who had at last so unconsciously revealed to her the inmost depths of his own abject and self-centred nature; and she wanted to be saved the hideous necessity for explaining to others what only the three Relfs at present knew—the way she had come to leave Whitestrland. Hungering for sympathy, as women will hunger in a great sorrow, she had opened to Edie, bit by bit, the floodgates of her grief, and told piecemeal the whole of her painful and pitiable story. In her own mind, Elsie was free from the reproach of an attempt at self-murder; and Edie and Mrs Relf accepted in good faith the poor heart-broken girl's account of her adventure; but she could never hope that the outer world could be induced to believe in her asserted innocence. She dreaded the nods and hints and suspicions and innuendoes of our bitter society; she shrank from exposing herself to its sneers or its sympathy, each almost equally distasteful to her delicate

nature. She was threatened with the pillory of a newspaper paragraph. Hugh Massinger's lie afforded her now an easy chance of escape. She accepted it willingly, without afterthought. All she wanted in her trouble was to hide her poor head where none would find it; and Edie Relf's plan enabled her to do this in the surest and safest possible manner.

Besides, she didn't wish to make Winifred unhappy. Winifred loved her cousin Hugh. She saw that now; she recognised it distinctly. She wondered she hadn't seen it plainly long before. Winifred had often been so full of Hugh; had asked so many questions, had seemed so deeply interested in all that concerned him. And Hugh had offered his heart to Winifred—be the same more or less, he had at least offered it. Why should she wish to wreck Winifred's life, as that cruel, selfish, ambitious man had wrecked her own? She couldn't tell the whole truth now without exposing Hugh. And for Winifred's sake at least she would not expose him, and blight Winifred's dream at the very moment of its first full ecstasy.

For Winifred's sake? Nay, rather for his own. For in spite of everything, she still loved him. She could never forgive him, but she still loved him. Or if she didn't love the Hugh that really was, she loved at least the memory of the Hugh that was not and that never had been. For his dear sake, she could never expose that other base creature that bore his name and wore his features. For her own love's sake, she could never betray him. For her womanly consistency, for her sense of identity, she couldn't turn round and tell the truth about him. To acquiesce in a lie was wrong, perhaps; but to tell the truth would have been more than human.

'I wish,' she cried in her agony to Edie, 'I could go away at once and hide myself for ever in America or Australia or somewhere like that—where *he* would never know I was really living.'

Edie stroked her smooth black hair with a gentle hand; she had views of her own already, had Edie. 'It's a far cry to Loch Awe, darling,' she murmured softly. 'Better come with mother and me to San Remo.'

'San Remo?' Elsie echoed. 'Why, San Remo?'

And then Edie explained to her in brief outline that she and her mother went every winter to the Riviera, taking with them a few delicate English girls of consumptive tendency, partly to educate, but more still to escape the bitter English Christmas. They hired a villa—the same every year—on a slope of the hills, and engaged a resident governess to accompany them. But, as chance would have it, their last governess had just gone off, in the nick of time, to get married to her faithful bank clerk at Brixton; so here was an opportunity for mutual accommodation. As Edie put the thing, Elsie might almost have supposed, were she so minded, she would be doing Mrs Relf an exceptional favour by accepting the post and accompanying them to Italy. And to say the truth, a Girton graduate who had taken high honours at Cambridge was certainly a degree or two better than anything the delicate girls of consumptive tendency could reasonably have expected to obtain at San Remo. But none the less the offer was a generous one, kindly meant;

and Elsie accepted it just as it was intended. It was a fair exchange of mutual services. She must earn her own livelihood wherever she went; trouble, however deep, has always that special aggravation and that special consolation for peniless people; and in no other house could she possibly have earned it without a reference or testimonial from her last employers. The Relfs needed no such awkward introduction. This arrangement suited both parties admirably; and poor heart-broken Elsie, in her present shattered condition of nerves, was glad enough to accept her new friends' kind hospitality at Lowestoft for the present, till she could fly with them at last, early in October, from this desecrated England and from the chance of running up against Hugh Massinger.

Her whole existence summed itself up now in the one wish to escape Hugh. He thought her dead. She hoped in her heart he might never again discover she was living.

On the very first day when she dared to venture out in a Bath-chair, muffled and veiled, and in a new black dress—lest any one perchance should happen to recognise her—she asked to be wheeled to the Lowestoft pier; and Edie, who accompanied her out on that sad first ride, walked slowly by her side in sympathetic silence. Warren Relf followed her too, but at a safe distance; he could not think of obtruding as yet a male presence upon her shame and grief; but still he could not wholly deny himself either the modest pleasure of watching her from afar, unseen and unsuspected. Warren had hardly so much as caught a glimpse of Elsie since that night on the *Mud-Turtle*; but Elsie's gentleness and the profundity of her sorrow had touched him deeply. He began indeed to suspect he was really in love with her; and perhaps his suspicion was not entirely baseless. He knew too well, however, the depth of her distress to dream of pressing even his sympathy upon her at so inopportune a moment. If ever the right time for him came at all, it could come, he knew, only in the remote future.

At the end of the pier, Elsie halted the chair, and made the chairman wheel it as she directed, exactly opposite one of the open gaps in the barrier of woodwork that ran round it. Then she raised herself up with difficulty from her seat. She was holding something tight in her small right hand; she had drawn it that moment from the folds of her bosom. It was a packet of papers, tied carefully in a knot with some heavy object. Warren Relf, observing cautiously from behind, felt sure in his own mind it was a heavy object by the curve it described as it wheeled through the air when Elsie threw it. For Elsie had risen now, pale and red by turns, and was flinging it out with feverish energy in a sweeping arch far, far into the water. It struck the surface with a dull thud—the heavy thud of a stone or a metallic body. In a second it had sunk like lead to the bottom, and Elsie, bursting into a silent flood of tears, had ordered the chairman to take her home again.

Warren Relf, skulking hastily down the steps behind that lead to the tidal platform under the pier, had no doubt at all in his own mind what the object was that Elsie had flung with such fiery force into the deep water; for that night on the

Mud-Turtle, as he tried to restore the insensible girl to a passing gleam of life and consciousness, two distinct articles had fallen, one by one, in the hurry of the moment, out of her loose and dripping bosom. He was not curious, but he couldn't help observing them. The first was a bundle of water-logged letters in a hand which it was impossible for him not to recognise. The second was a pretty little lady's watch, in gold and enamel, with a neat inscription engraved on a shield on the back, 'E. C. from H. M.,' in Lombardic letters. It wasn't Warren Relf's fault if he knew then who H. M. was; and it wasn't his fault if he knew now that Elsie Challoner had formally renounced Hugh Massinger's love, by flinging his letters and presents bodily into the deep sea, where no one could ever possibly recover them.

They had burnt into her flesh, lying there in her bosom. She could carry them about next her bruised and wounded heart no longer. And now, on this very first day that she had ventured out, she buried her love and all that belonged to it in that deep where Hugh Massinger himself had sent her.

But even so, it cost her hard. They were Hugh's letters—those precious much-loved letters. She went home that morning crying bitterly, and she cried till night, like one who mourns her lost husband or her lost children. They were all she had left of Hugh and of her day-dream. Edie knew exactly what she had done, but avoided the vain effort to comfort or console her. 'Comfort—comfort scorned of devils!' Edie was woman enough to know she could do nothing. She only held her new friend's hand tight clasped in hers, and cried beside her in mute sisterly sympathy.

It was about a week later that Hugh Massinger, goaded by remorse, and unable any longer to endure the suspense of hearing nothing further, directly or indirectly, as to Elsie's fate, set out one morning in a dogcart from Whitestrand, and drove along the coast with his own thoughts, in a blazing sunlight, as far as Aldeburgh. There, the road abruptly stops. No highway spans the ridge of beach beyond: the remainder of the distance to the Low Light at Orfordness must be accomplished on foot, along a flat bank that stretches for miles between sea and river, untrodden and trackless, one bare blank waste of sand and shingle. The ruthless sun was pouring down upon it in full force as Hugh Massinger began his solitary tramp along that uneven road at the Martello Tower, just south of Aldeburgh. The more usual course is to sail by sea; and Hugh might indeed have hired a boat at Slaughden Quay if he dared; but he feared to be recognised as having come from Whitestrand to make inquiries about the unclaimed body; for to rouse suspicion would be doubly unwise: he felt like a murderer, and he considered himself one by implication already. If other people grew to suspect that Elsie was drowned, it would go hard but they would think as ill of him as he thought of himself in his bitterest moments.

For, horrible to relate, all this time, with that burden of agony and anguish and suspense weighing down his soul like a mass of lead, he had had to play as best he might, every night and morning, at the ardour of young love with that girl

Winifred. He had had to imitate with hateful skill the wantonness of youth and the ecstasy of the happily betrothed lover. He had had to wear a mask of pleasure on his pinched face while his heart within was full of bitterness, as he cried to himself more than once in his reckless agony. After such unnatural restraint, reaction was inevitable. It became a delight to him to get away for once from that grim comedy, in which he acted his part with so much apparent ease, and to face the genuine tragedy of his miserable life, alone and undisturbed with his own remorseful thoughts for a few short hours or so. He looked upon that fierce tramp in the eye of the sun, trudging ever on over those baking stones, and through that barren spit of sand and shingle, to some extent in the light of a self-imposed penance—a penance, and yet a splendid indulgence as well; for here there was no one to watch or observe him. Here he could let the tears trickle down his face unreprieved, and no longer pretend to believe himself happy. Here there was no Winifred to tease him with her love. He had sold his own soul for a few wretched acres of stagnant salt marsh: he could gloat now at his ease over his hateful bargain; he could call himself 'Fool' at the top of his voice; he could groan and sigh and be as sad as night, no man hindering him. It was an orgy of remorse, and he gave way to it with wild orgiastic fervour.

He plodded, plodded, plodded ever on, stumbling wearily over that endless shingle, thirsty and footsore, mile after mile, yet glad to be relieved for a while from the strain of his long hypocrisy, and to let the tears flow easily and naturally one after the other down his parched cheek. Truly he walked in the gall of bitterness and in the bond of iniquity. The iron was entering into his own soul; and yet he hugged it. The gloom of that barren stretch of water-worn pebbles, the weird and widespread desolation of the landscape, the fierce glare of the mid-day sun that poured down mercilessly on his aching head, all chimed in congenially with his present brooding and melancholy humour, and gave strength to the poignancy of his remorse and regret. He could torture himself to the bone in these small matters, for dead Elsie's sake; he could do penance, but not make restitution. He couldn't even so tell out the truth before the whole world, or right the two women he had cruelly wronged, by an open confession.

At last, after mile upon mile of weary staggering, he reached the Low Light, and sat down, exhausted, on the bare shingle just outside the lighthouse-keeper's quarters. Strangers are rare at Orfordness; and a morose-looking man, soured by solitude, soon presented himself at the door to stare at the new-comer.

'Tramped it?' he asked curtly with an inquiring glance along the shingle beach.

'Yes, tramped it,' Hugh answered with a weary sigh, and relapsed into silence, too utterly tired to think of how he had best set about the prosecution of his delicate inquiry, now that he had got there.

The man stood with his hand on his hip, and watched the stranger long and close, with frank mute curiosity, as one watches a wild beast in its cage at a menagerie. At last he broke the solemn silence once more with the one inquisitive word, 'Why?'

'Amusement,' Hugh answered, catching the man's laconic humour to the very echo.

For twenty minutes they talked on, in this brief disjointed Spartan fashion, with question and answer as to the life at Orfordness tossed to and fro like a quick ball between them, till at last Hugh touched, as if by accident, but with supreme skill, upon the abstract question of provisioning lighthouses.

'Trinity House steam-cutter,' the man replied to his short suggested query, with a sidelong jerk of his head to southward. 'Twice a month. Very fair grub. Biscuit an' pork an' tinned meats an' sich like.'

'Queer employment, the cutter's men,' Hugh interposed quietly. 'Must see a deal of life in their way sometimes.'

The man nodded. 'An' death too,' he assented with uncompromising brevity.

'Wrecks?'

'An' corpses.'

'Corpses?'

'Ah, corpses, I believe you. Drowned. Heaps of 'em.'

'Here?'

'Well, sometimes. On the north side, mostly. Drift with the tide. Cutter's man found one only a week or two ago, as it might be Saturday. Right over yonder, by the groyne, to windward.'

'Sailor?'

'Not this time—gal—young woman.'

'Where did she come from?' Hugh asked eagerly, yet suppressing his eagerness in his face and voice as well as he was able.

'How should I know?' the man answered with something very like a shrug. 'They don't carry their names an' addresses written on their foreheads, as if they was vessels. Lowestoft, Whitestrang, Southwold, Aldeburgh—might 'a been any on 'em.'

Hugh continued his inquiries with breathless interest a few minutes longer; then he asked again in a trembling voice: 'Any jewelry on her?'

The man eyed him suspiciously askance. Detective in disguise, or what? he wondered. 'Ask the cutter's man,' he drawled out slowly, after a long pause. 'Taint likely, if there was any jewelry on a corpse, he'd leave it about her for the coroner to claim, till he'd brought her up here, is it?'

The answer cast an unexpected flood of light on the seafaring view of the treasure-trove of corpses, for which Hugh had hardly before been prepared in his own mind. That would account for her not having been recognised. 'Did they hold an inquest?' he ventured to ask nervously.

The lighthouse-man nodded. 'But what's the good?—no evidence,' he continued. 'Not identified. They mostly ain't, these here drowned bodies. Jury brought it in "Found drowned." Convenient vardick—saves a sight of trouble.'

'Where do you bury them?' Hugh asked, hardly able to control his emotion.

The man waved his hand with a careless dash towards a sandy patch just beyond the High Light. 'Over yonder,' he answered. 'There's shiploads of 'em yonder. Easy digging—easier 'an the shingle. We planted the crew of a Hamburg brigantine there in a lump last winter. Went ashore on the Ooze Sands. All hands drowned—

about a baker's dozen of 'em. Coroner comes over by boat from Orford an' sits upon 'em here on the spot, as you may term it. That's consecrated ground. Bishop ran down and said his prayers over it. A corpse couldn't lie better nor more comfortable, if it comes to that, in Kensal Green Simmetry.'

He laughed low to himself at his own grim wit; and Hugh, unable to conceal his disgust, walked off alone, as if idly strolling in a solitary mood, towards that desolate graveyard. The lighthouse-man went back, rolling a quid in his bulged cheek, to his monotonous avocations. Hugh stumbled over the sand with blinded eyes and tottering feet till he reached the plot with its little group of rude mounds. There was one mound far newer and fresher than all the rest, and a wooden label stood at its head with a number roughly scrawled on it in wet paint—'240.' His heart failed and sank within him. So this was *her* grave!—Elsie's grave! Elsie, Elsie, poor, desolate, abandoned, heart-broken Elsie.—He took off his hat in reverent remorse as he stood by its side. O heavens, how he longed to be dead there with her! Should he fling himself off the top of the lighthouse now? Should he cut his throat beside her nameless grave? Should he drown himself with Elsie on that hopeless stretch of wild coast? Or should he live on still, a miserable, wretched, self-condemned coward, to pay the penalty of his cruelty and his baseness through years of agony?

Elsie's grave! If only he could be sure it was really Elsie's! He wished he could. In time, then, he might venture to put up a headstone with just her initials—those sacred initials. But no; he dared not. And perhaps, after all, it might not be Elsie. Corpses came up here often and often. Had they not buried whole shiploads together, as the lighthouse-man assured him, after a terrible tempest?

He stood there long, bareheaded in the sun. His remorse was gnawing the very life out of him. He was rooted to the spot. Elsie held him spellbound. At length he roused himself, and with a terrible effort returned to the lighthouse. 'Where did you say this last body came up?' he asked the man in as careless a voice as he could easily master.

The man eyed him sharp and hard. 'You seem precious anxious about that there young woman,' he answered coldly. 'She floated alongside by the groyne over yonder. Tide throwed her up. That's where they mostly come ashore from Lowestoft or Whitestrang. Current sweeps 'em right along the coast till they reach the ness; then it throws 'em up by the groyne as reg'lar as one o'clock. There's a cross-current there; it's that as makes the point and the sandbank.'

Hugh faltered. He knew full well he was rousing suspicion; yet he couldn't refrain for all that from gratifying his eager and burning desire to know all he could about poor martyred Elsie. He dared not ask what had become of the clothes, much as he longed to learn, but he wandered away slowly, step after step, to the side of the groyne. Its further face was sheltered by heaped-up shingle from the lighthouse-man's eye. Hugh sat down in the shade, close under the timber balks, and looked around him along the beach where Elsie had been washed ashore, a lifeless

burden. Something yellow glittered on the sands hard by. As the sun caught it, it attracted for a second his casual attention by its golden shimmering. His heart came up with a bound into his mouth. He knew it—he knew it—he knew it in a flash. It was Elsie's watch! Elsie's! Elsie's! The watch he himself had given—years and years ago—no; six weeks since only—as a birthday present—to poor dear dead Elsie.

Then Elsie was dead! He was sure of it now. No need for further dangerous questioning. It was by Elsie's grave indeed he had just been standing. Elsie lay buried there beyond the shadow of a doubt, unknown and dishonoured. It was Elsie's grave and Elsie's watch. What room for hope or for fear any longer?

It was Elsie's watch, but rolled by the current from Lowestoft pier, as the lighthouse-man had rightly told him was usual, and cast ashore, as everything else was always cast, by the side of the groyne where the stream in the sea turned sharply outward at the extreme easternmost point of Suffolk.

He picked it up with tremulous fingers and kissed it tenderly; then he slipped it unobserved into his breast-pocket, close to his heart—Elsie's watch!—and began his return journey with an aching bosom, over those hot bare stones, away back to Aldeburgh. The beach seemed longer and drearier than before. The orgy of remorse had passed away now, and the coolness of utter despair had come over him instead of it. Half-way on, he sat down at last, wearier than ever, on the long pebble ridge, and gazed once more with swimming eyes at that visible token of Elsie's doom. Hope was dead in his heart now. Horror and agony brooded over his soul. The world without was dull and dreary; the world within was a tempest of passion. He would freely have given all he possessed that moment to be dead and buried in one grave with Elsie.

At that same instant at the Low Light the cutter's man, come across in an open boat from Orford, was talking carelessly to the underling at the lighthouse.

'How's things with you?' he asked with a laugh.

'Pretty much alike, and that stodgy,' the other answered grimly. 'How's yours?'

'Well, we've tracked down that there body,' the Trinity-House-man said casually; 'the gal's, I mean, as I picked up on the ness: an' after all my trouble, Tom, you wouldn't believe it, but, hang it all, there ain't never a penny on it.'

'No?' the lighthouse-man murmured interrogatively.

'No, not a farden,' the fellow Bill responded in a disconsolate voice. 'Wy should there be, neither? That's 'ow I puts it. 'Tain't a nob's. Turns out she warn't nobody, after all, but one o' these 'ere light-o'-loves down yonder at Lowestoft. Must 'a been a sailor's Poll, I take it. Threwed 'erself in off Lowestoft pier one dark night, might be three weeks gone or might be a fortnight, on account of an altercation she'd 'a bin 'avin with a young man as she was keepin' company with.—Never seen a more promisin' nor a more disappointin' corpse in my born days. Wen I picked 'er up, says I to Jim—"Jim," says I, as confident as a churchwarden, "you may take your davy on it she's a nob, this gal, by the mere look o' 'er, an

there's money on the body."—Wy, 'er dress alone would 'a made any one take 'er for a genu-wine lady.—An' 'ow does it turn out? A bad lot! Just the parish pay for 'er, an' that in Suffolk. If it 'adn't bin for a article or two in the way of rings as fell off 'er fingers, in the manner o' speakin', an' dropped as I may say into a 'onest man's pocket as 'e was a-carryin' 'er in to take 'er to the mortuary—wy, it do seem probable, it's my belief, as that there 'onest man might 'a bin out a shillin' or so in 'is private accounts through the interest he'd 'a took in that there worthless an' unprincipled young woman.—Corpses may look out for themselves in future as far as I'm concerned. I've 'ad too much of them; they're more bother'n they're worth. That's just the long an' the short of it.'

RESPONSIBILITY OF TRUSTEES:

IN RESPECT TO CHOICE OF SECURITIES.

THERE is considerable misapprehension as to the responsibility of trustees for the sufficiency of property on which any part of trust funds may be invested. Generally, it is supposed that if they act under the advice of a professional valuer, they are safe; but this is a proposition which must be accepted with considerable caution, as it is by no means of universal application. Of course, it is well understood that the terms of the investment clause must be strictly observed. If power is only given to invest upon government or real security, no other investments can be safely resorted to. But when the trust-deed gives no specific directions as to investments, the scope for discretion which is thus left open must be judiciously exercised, for if negligently exercised, the trustees are personally responsible. There have recently been two or three cases which have been calculated to impress upon the trustees concerned this truth in an unforgettable manner. Sir George Jessel, the late Master of the Rolls, laid down one rule in words easily remembered, saying: 'A trustee ought to conduct the business of the trust in the same manner that an ordinarily prudent man of business would conduct his own affairs.' With the strict observance of the power of investment and of this rule, a trustee will generally be safe; but in too many instances there may be found a laxity in the way in which trust business is conducted, which is highly dangerous to the pecuniary interests of the trustees. Perhaps, the simplest way of impressing the requisite lesson upon the minds of trustees will be to consider a typical case which was recently confirmed on appeal from the vice-chancellor, and which strikingly illustrates the danger to which we have referred.

A testator bequeathed a certain sum of money to his executors and trustees upon trust, to invest the same upon (amongst others) real securities in England or Wales. Part of the money was lent on mortgage of certain freehold cottages, and although the security was ultimately found to be insufficient, in consequence of depreciation in value after the money was lent, the trustees were not held personally responsible in respect thereof, as they could not foresee what was to happen in future; and it was held that the security was a proper one at the time when the

money was invested. Of course, if they had acted very negligently in the matter, they could have been required to make good the loss.

The other and larger portion of the trust money was lent upon a so-called security of a very different class. The property in this case consisted of a brickyard and premises appurtenant thereto, including the usual buildings, sheds, &c. The owners of the property had given for it twice the amount of money which they borrowed from the trustees; and the valuer employed by the latter was of opinion that it was a good security for the amount required. And here we may remark that the valuer did not value the property as he ought to have done, or stated in his valuation what he considered the value thereof, in order that the trustees might make their own calculations as to whether they could or could not safely make the advance required. On the contrary, he merely said that he considered the property a good security for the amount required to be advanced, and entered into some speculative remarks as to the improvement in their business which the mortgagers might accomplish with the use of additional capital, which was about the most injudicious thing which he could have said. It does not require much practical knowledge of the business of brickmaking, which involves the carrying away of the estate in small portions, to come to the conclusion that the more bricks are made out of a limited area the sooner the land will be so greatly reduced in value as to be altogether inadequate as a security by way of mortgage for a sum which could safely be advanced upon the land and be allowed to remain so long as it was intact.

It was strongly argued on behalf of the persons beneficially interested under the will, that this was not a proper security on which the trustees ought to have invested, because the real security, apart from the business carried on by the mortgagers, was utterly insufficient for the purpose. The power to lend upon real security authorised such investments as might be dependent upon the value of the freehold property, apart from the uses to which it might be put. But when the trade prospects of the owners of the land had to be taken into account in order to estimate the sufficiency of the security, then the line was passed; the security was not properly a real security, but one which depended for its sufficiency upon the success of the business and the personal covenant of the borrowers, which reduced the better (or larger) part of the security to the level of a personal security. Apart from the fact of the brick-clay being in course of exhaustion, it appeared that for any other purpose than the particular trade of brickmaking this land would not have been at any time a sufficient security for the sum advanced thereon.

And here we may explain what is the proper course for trustees to pursue with respect to the valuation by a professional valuer. The value ought to be given apart altogether from the question as to the amount which could be safely advanced thereon; and then, if the property consisted of agricultural land, the trustees might safely advance any sum not exceeding two-thirds of such amount; if of houses with gardens and other usual appurtenances, the advance ought not to exceed one half of the amount of the valuation.

As to any securities involving special risks, trustees had better have nothing to do with any such, unless they are substantially indemnified in respect thereof by the beneficiaries, or by some person or persons on their behalf. In the present case, the tenant for life wished the trustees to withdraw the money from government security, on which it had been invested, and to put it out on mortgage, which they did; but she did not in any way indemnify them in respect of any loss which might happen to the trust money in consequence of such change of investment.

A few years after the money had been lent on the brickyard, the mortgagers were adjudicated bankrupt; and thereupon it was discovered that the property (apart from the business which had gone) was not of sufficient value to enable the mortgagees to recover the amount due to them for principal money, interest, and costs; and thereupon they were called upon to make good the loss occasioned by their injudicious investment, the plaintiffs in the action being the tenant for life, at whose request the money had been sold out of consols, and her children. It did not appear that the lady had done anything to make herself personally responsible, beyond requesting the trustees to find an investment that would yield her a larger return than consols; she had neither seen the property nor in any other way formally approved of the security, and the children were infants respectively under the age of twenty-one years, and therefore incapable of interfering.

After hearing counsel on both sides, the court held that the trustees had not acted as prudent men would do in their own affairs, and therefore that they must be held responsible for the loss. The buildings upon the land were practically of no value, as they were no longer wanted where they stood, and would not be worth the expense of pulling down, taking away, and erecting elsewhere. And as to the land itself, it was not available for agricultural purposes. Everybody who knows anything about property knows the practical disadvantages of an exhausted brickyard with its excavations and mounds. The judge adopted the view expressed by counsel for the plaintiff, that the money was not in fact advanced upon real security at all, but upon the chances of a business being successful, although the basis of the security was, in fact, freehold land, and therefore real security to that extent. The following passages from the judgment of the learned Vice-chancellor may be quoted as being easily remembered by other trustees than those so unpleasantly mixed up with the case in question: 'Were the trustees, giving them credit for good intentions, justified in lending so large a sum of money without a certain and clear prospect, by legal proceedings or otherwise, of getting it back, of which I do not see that they had the slightest chance? Are trustees justified in lending money on a trade, on the hazard whether it be successful or not? I think not.' But, inasmuch as the trustees had not been guilty of any misconduct, having only made a mistake, they were not ordered to pay the costs of the proceedings, but only to make good the loss which has been, or will eventually be sustained by their ill-advised advance on the brickyard.

One point is to be borne in mind. If money were advanced by trustees upon a farm which was a sufficient security, and afterwards, by the depression in agriculture, the farm became so depreciated in value as to be insufficient, the loss having been occasioned by circumstances which they could neither control nor foresee, they would not be held responsible, as was illustrated by the decision as to the cottages in the case now before us. But what they are to be held answerable for is the advancing money on property of which the value depends upon the then owners being able to continue their business and being successful therein; that is to say, upon security which is not *real*, but is personal, uncertain, and manifestly unreliable.

The law regulating the responsibility of trustees may for all practical and popular purposes be looked upon as identical throughout the United Kingdom. Decisions of the House of Lords have swept away one by one the immunities which Scotch trustees were at one time supposed to enjoy. Many Scotch trust deeds declare that trustees shall not be liable for omissions, and only each for his own intromissions; but notwithstanding such apparent immunity, which has for its object to induce trustees to accept of an unpaid and often thankless office, no trustee is *safe* who does not either obey the express directions of the trust deed, or exercise as lively an intelligence and as vigilant a discretion as he would or could exercise in the management of his own affairs. No safeguard whatever can prevent courts of law from breaking in upon and inflicting penal consequences upon gross negligence in the discharge of a duty which has been deliberately undertaken.

THE POLRUAN FERRYBOAT.

POLRUAN is a quaint small fishing village, straggling up the side of a hill so steep that it is marvellous none of the houses slip off its slope into the cool green waters of the harbour. Polruan is small; it is moreover dirty, and pervaded with odours which may be as health-inspiring as the inhabitants maintain, but which for all that are disagreeable to a stranger. Further, the houses are so inextricably entangled one with another that it is hardly possible to take three steps from the door of any one without finding yourself in your neighbour's kitchen; and the small space on which the village stands is beset with such a labyrinth of courtyards, alleys, and passages ending in dead walls, that strangers rarely venture to traverse it without a guide. That such precautions against going astray are necessary does not seem to the inhabitants of Polruan to be a reproach. They do not invite strangers to their village: they regard them with suspicion, and think it a pious duty to discourage their visits. In truth, why should strangers visit Polruan? It has no architectural beauty; it is not even clean; the harbour on which it stands is better seen from the larger older town on the opposite shore. The inducements to set foot on Polruan pier are therefore slight; and it follows that whoever does so, not having immediate and urgent business in the place, must be impelled by some disreputable motive. He must, for instance, be a tax-collector or an exciseman, or at least

in the interest or pay of one or other of those persons; and it thus becomes the plain duty of every inhabitant to baffle him. Polruan desires nothing from the outside world. It supports its own Dissenting chapel, of which the minister dwells in a whitewashed cottage at the head of the town; it has its own shop, wherein everything can be bought which it is good to buy, and even some things which it is not; it has its inn down by the quay; and it sends its fish across the harbour to the town, maintaining for that purpose a ferryboat at its own proper charges. A more self-centred community does not exist in the west country, nor one of which, for its individuality and determined opposition to improvement, that west country has more reason to be proud.

In October, if the weather has not broken, life is very pleasant at Polruan. The air is still soft and warm, though there is an inspiring freshness in it which makes the blood dance and tingle, and turns that bodily exercise into a happiness which in the sultry summer-time was a fatigue too great to be endured. The sea is ruffled by light fresh breezes, and clouds and sunshine chase each other across the surface of the water. But the October sun stood in a very different sky when, on a certain windy afternoon some twenty years ago, Thomas Arthur, minister for a whole generation of the little whitewashed chapel above the town, stood in his garden gazing at the storm-tossed harbour with an air of disappointment on his face. The air was full of sound, and the great gusts which tore down the valley were lashing up the waters of the harbour into foam. The sky bore that sullen look which is the sure precursor of storm, and the most inexperienced landsman could have foretold that rough weather was at hand.

'The day is too bad; I must give it up,' he said, and turned regretfully back upon the gravelled path which led to his own front door. He could not at once prevail on himself, however, to abandon the expedition he had planned, and on reaching his threshold, turned again to the gateway, where he stood looking out, a tall, bent, weak-chested man, very little fit to make his way through such a storm as was then brewing. He had not stood at his gate more than five minutes, when a quick step came round the corner by the wall of the coastguard station, and a laughing voice exclaimed: 'Do look at him! Isn't he miserable!—Why, Uncle Tom, has the wind blown away your "copy," as you call it? Or has the soot come down the chimney and driven you out of your study? What has happened, or what hasn't happened? Something important, surely, if it requires such a woe-begone face.'

It would have been a very gruff old curmudgeon who could have answered this string of questions testily, they were put with such a winning smile, and the lips which asked them were so full and red. Susan Arthur was not accustomed to meet with peevishness from the men whom she blessed with her society; and if at other times the charm of her manner was wont to soften the most leathery hearts, who could have resisted her on this stormy afternoon, when her dark hair was blown from under her hood about her face, and the exertion of walking against the wind had caused the blood to mantle richly in her cheeks? She opened the white gate whilst she was still

speaking, and closing it again behind her, she slipped her arm beneath her uncle's and walked beside him.

'What is it, Uncle Tom?' she asked more seriously.—'Aunt Elizabeth is not ill?'

'Not more so than usual, my dear,' Mr Arthur answered. 'She sits beside the fire year in year out; and whether the sun blazes or the frost lies on the roof, she pokes the fire just the same and complains of cold.'

Susan laughed. 'Well, if it isn't Aunt Elizabeth, what is it? You're all right, I suppose, or you wouldn't be out in this weather. You want to go somewhere, and you can't. Tell me all about it.'

She certainly was a very charming girl; and the old minister cheered up perceptibly under the inspiring influence of her downright manner.

'Well, the fact is,' he began confidentially.—'You won't understand me, I know—but there is a man called Tertullian'—He stopped and looked at Susan, as if he did not know how to complete his sentence.

'Not in Polruan, Uncle Tom,' she answered decidedly; 'nor in Trewint, nor in Polgedre, nor anywhere at all in these parts. Of that I am sure.'

'No, no! You are too hasty, child. I didn't say in these parts: he lived in Rome.'

'Dear, dear!' exclaimed Susan. 'Then there is no help for it, because you can't go there.'

'I knew you wouldn't understand me,' said Mr Arthur feebly; 'and I don't know how to make you. It's a book, child—a book that I want sorely; and I could have got it if I had been able to get across to the town. But it is going to rain, and the day is much too stormy for me.'

'Of course it is,' his niece replied promptly. 'Could you buy it at the post-office, and how much would it cost?—Two shillings?'

Mr Arthur stared at his niece aghast. The idea of a copy of Tertullian lying for sale on the counter at the post-office among the collections of picture gift-books for Sunday schools, and the gaudy railway novels which stood in place of literature in the town, was almost more than his preoccupied mind could grasp.

Susan burst into laughter on catching sight of his expression. 'Never mind, Uncle Tom; I see I am all wrong. We haven't any intellects in Polruan, you know, and we don't understand these things. But I am going across the harbour now in a few minutes; and if you just tell me where to get the book and write down the name for me, you shall surely have it to-night.'

'My dear child, you are the kindest girl!' Mr Arthur broke out. 'If you only knew how you have relieved my mind! I could get it myself to-morrow, very likely; but to-morrow wouldn't do as well for me. I want to refer to it now, while the ideas are in my head.'

'Of course you do. I understand that very well. You shall have it, uncle—never fear.'

'But the weather, Susan!' Mr Arthur interjected, seized with a fresh despair. 'A storm is creeping up. It is very rough already; I can't let you go in this weather.'

'Pooh, pooh! It isn't so bad as all that. I don't think much of a little wind. And see, the sun is coming out.'

Indeed, at that moment there was a slight break in the clouds, and a few sickly rays struggled forth, casting a dull reflection on the broken water.

'It does seem to be improving,' said her uncle. 'Perhaps the wind may drop.'

'It is dropping already; the storm is over,' said Susan cheerfully. 'How I love a windy day! How glorious it is to feel all the used-up air that we have breathed for weeks driven far away out to sea, and great streams of fresh clean wind rushing in from heaven knows where! It takes a day like this, Uncle Tom, to make one feel alive.'

'I am glad you like it,' Mr Arthur said fretfully. 'A very few such days would make me feel dead. But come into the house, child; I will write you down the name of the book.' He led the way into the small front parlour of his house, where a fragile old lady with gray hair sat rocking herself to and fro before the fire. She held her knitting in her hand, but was not working, and appeared, in fact, to be more asleep than awake.

'How are you to-day, Aunt Elizabeth?' said Susan. 'I am going over to the town on an errand for my uncle: can I get anything for you?'

'Take care of yourself, Susan,' the old lady answered drowsily. 'You had much better not go. It is very rough. Harken to the wind!' She held up her hand; but the wind had lulled, and there seemed for the moment to be a dead calm out of doors.

'There isn't any wind, my dear,' Mr Arthur interposed hastily.—'Susan will be back long before the storm comes down, if you don't keep her now.—Here Susan; I have written two lines to Dr Fisher about the book; he will understand what I want.'

'I shouldn't go if I were you, Susan,' Mrs Arthur murmured, as if she were talking in her sleep. 'I know all about the weather. It began just like this when the revenue cutter was wrecked ten years ago.'

'I'm not afraid.—Good-bye, aunt;' and to Mr Arthur's intense relief, Susan slipped out of the room and, with a parting wave of her hand, ran down the hill towards the ferry.

Her uncle went out again into the garden—he wanted to satisfy himself that the girl had really started. From the hill on which his house stood there was an uninterrupted view of the harbour, though the quay from which the ferryboat set out was hidden by the houses on the lower part of the hill. Allowing ten minutes for her to reach the quay, that would be five turns along the garden walk. The boat was not on the water or at the further side, so there should be no delay.

The five turns had extended to fifty, however, and Mr Arthur's patience was spent before he saw the heavy ferryboat emerge from beneath the houses. He had many times before watched the passage of the boat; it was, in fact, a customary amusement with him to look out for it and to try to recognise at a great distance the persons who were sitting in it; but never did he remember to have seen it so lightly laden. There was no other passenger but his niece, and yet the boat made way very slowly. The sea was

evidently rougher than he had thought; more than once a wave broke into the boat, which pitched and rolled in a way that must have made the labour of rowing very heavy. The muscles of the ferryman's back and shoulders were of iron, however; and at last Mr Arthur had the satisfaction of seeing the boat draw near the quay on the opposite shore. It was already growing dusk; and he went indoors to await the return of his niece with what patience he could muster.

Meantime, Susan made her way up the steep streets towards the rectory. She walked as quickly as she could, for the passage had proved so much rougher than she expected, that she was anxious not to be overtaken by nightfall before she could cross back again to Polruan. Moreover, the abatement of the wind proved to be deceitful, for it was already blowing as hard as ever, and the momentary gleam of sunlight was now quite obscured. The door of the rectory was opened by an old woman in a scrupulously neat black silk dress, who welcomed her visitor joyfully.

'Tis Susan Arthur, I declare!—Well, child, I'm pleased to see you. But what did you mean by coming over when the wind is so high?—Come in out of the weather. I was just going to tea, and the splitters are but now made.'

Dr Fisher's housekeeper—by him called Tabitha, and by the rest of the world Mrs Pascoe—was a cousin of the Arthurs by the mother's side; and Susan was a constant visitor of hers. The old lady led her guest into the comfortable little parlour at the back of the house, which was devoted to her sole use, and drew her over to the hearth, on which a bright fire was blazing.

'Why, what's this?' she said suddenly, holding up her hand to the light.—'Child, you're wringing wet. Have you been in the water?'

'The sea was very rough, and the waves broke over the boat, Mrs Pascoe. 'Tis of no consequence.'

'Perhaps it isn't to you, my dear, but it is to your friends, whether you catch cold and die, or not. What your mother was thinking of, to let you cross in this weather, I can't imagine.—But now you are here, you shan't stay wet.'

'Dear Mrs Pascoe,' Susan entreated, 'don't ask me to change my dress. It will take so long to dry, and I really want to get back.'

'Stuff and nonsense! You're not going back till you have had your tea; and the dress will dry very well by that time.'

Mrs Pascoe was used to carrying her point; and in a very few minutes Susan was arrayed in a warm dress many sizes too large, while her own was emitting clouds of steam before the kitchen fire.

'And what has brought you here, child?' asked the housekeeper, when these arrangements had been completed. 'Not but what I'm very glad to see you; and I wish you would come oftener; for 'tis a lonely life we lead here, and that's the truth of it. Though I'm not dull, because I always said that when a woman's got her Bible and her knitting she's got as much as is good for her; and if there isn't some poor person that wants warm knitted things, there's always one's soul calling out for food. But there's a day now and then when I think I'd like well enough to have some one but the girl to talk to; for that's all I have, now Dr Fisher spends his days so much

at the Hall and only comes home for his bed. He's there to-day, and has been every day this week.'

'Is he not at home? O dear, how unfortunate! I've got a note from my uncle for him.'

'Give it me now, then,' said the good-natured old woman. 'I'll send it up by one of the boys. You'll not like to wait till the doctor comes in.'

She went out on her errand; and Susan, as she waited for her return, listened uneasily to the roaring of the wind, which had certainly risen in the last half-hour.

'Tis a bad night,' said Mrs Pascoe as she re-entered the room. 'Pray God there may be no poor sailors wanting his help before day.—Susan, you'll not go back to-night.'

'I must, indeed, thank you. They don't know at the farm that I have come; and besides, I promised my uncle he should have the book he wanted. 'Tis one he is asking Dr Fisher to lend him.'

'And why can't he wait till to-morrow? Is a book worth risking lives about?'

'There's never been an accident on the ferry; it's as safe as the high-road. Anthony Williams has crossed too often to be afraid of any weather; and I've known much worse nights than this.'

Mrs Pascoe shook her head. 'Well, George can't be back for half an hour yet,' she said, 'so we haven't any need to hurry.—And how is Cousin Jane?'

Susan unfolded her budget of home news; and the two women chatted comfortably for a long time, while outside the dusk deepened into night, and the sullen roaring of the wind served only to increase the comfort of the fireside by which they sat. The delay was not wholly pleasant to Susan, however; she was anxious to complete her errand and be gone. At last the door opened and a comely servant-girl brought in a note, which Mrs Pascoe opened at once.

'It's all right,' she said. 'I'm to give you the book. It's on the third shelf in the library, the doctor says.'

She took the lamp from the table and led the way into Dr Fisher's study. The shelves were long and deep; the titles, in faded gilding on the backs of the books, were hard to read in the dim light; and the Latin words in most of them puzzled both Susan and the housekeeper sorely. The right volume was found at last, and wrapped carefully in many folds of brown paper, to protect it from damage on the journey. Susan resumed her own dress and made ready to depart.

'I don't like your going at all,' the housekeeper said. 'Susan, you shan't cross the ferry to-night. Listen to the wind! As like as not, Anthony Williams won't go.'

'He'll go for me,' the girl answered; 'and I must get back, thank you.—Oh, I don't think much of this. It isn't half so bad as I thought.—Good-night, Mrs Pascoe; and thank you for your trouble.'

Susan was right in saying she did not mind the weather. From her childhood it had been her delight to go out with any boatman who would take her; and she feared a rough sea as little as any fisherman in her native village. Still, as she went down through the precipitous streets, a half-wish crept into her heart that she had accepted her old friend's offer and remained at

the rectory. The night was certainly much wilder than the day had been. The wind met her at every corner like a solid wall, moving forwards almost irresistibly, so that more than once she staggered back into a doorway and had almost fallen. The air was filled with noise; there was a steady roar overhead, and with it was mingled at intervals a loud sound of rending, which put Susan in mind of one of her childish fancies, picturing the storm-wind as an old man of gigantic size, higher than the mountains, who strode by striking in fury hither and thither with his club.

It was desolate enough, she felt, to be out in such a storm, with the wide harbour between herself and home. The streets of the town were empty, save where beneath the projecting upper story of the inn a group of sailors stood silently together; and the moon, breaking suddenly through the wild black clouds, threw a flood of cold light upon the scene, increasing thereby, as Susan thought, its loneliness tenfold. It was not so much that the town by night was not familiar to her, or that she was unused to go about alone; but the sense that there was some resistless power in the air, against which humanity might set forth all its strength in vain, awed her. She shuddered, hardly knowing why, at each fresh blast of the storm; and this was not from fear, for she dreaded nothing palpable, but from a vague sense of insignificance, of absolute impotence, in the face of such a tempest. She hurried forward, clasping the book with which she was charged tightly to her breast, until she reached the quay whence the ferryboat started, and came in sight of the storm-tossed harbour, and the lights of Polruan on the hill beyond.

Those lights were a comfort to her: they were like friendly messages sent to her from her home. She could clearly detect the gleam proceeding from her uncle's house, doubtless from the room in which he was sitting even at that moment anxiously expecting her return, impatiently wondering what could keep her, fretting at the hindrance imposed on his work by the delay in obtaining the book without which he could not proceed.

'Dear uncle, I will not fail you,' Susan said aloud, as if she thought her words could travel over all the intervening distance.

A woman from Polruan, whom Susan knew well by sight, was standing on the quay, watching for the boat, and turned towards her on hearing her speak.

'Do'ee see un, Miss Arthur?' she asked. 'I can't make un out. He wouldn't be coward enough to go home to bed without coming back, surely.'

'I see the boat,' Susan answered. 'He has to fetch a long way up past the church. The tide must be very strong.—It's ebbing, isn't it?'

'Turned at six o'clock, and it's running cruel strong.—'Tis a bad night, sure enough.'

In a few minutes the boat grated against the landing-slip, and Anthony Williams leaped out to make the moorings secure.

'If you be going back to Polruan,' he said sulkily, 'you'll get so wet as if you were swimming. There's not a dry thread on me, so I tell'ee.' Then, as he recognised to whom he was speaking, he added in a changed tone: 'Why,

it's never you, Miss Susan! Your uncle's in a pretty twitter about you. He's been down to the pier three times—so John Trebilcock says—to know if you're not back. But John told him at last you'd stay all night, as like as not.'

'Well, you see, John was wrong, for I am here, and I mean to go across. So, please start as soon as you can, for it's late enough already.'

''Tis all very well to talk,' the man grumbled. 'If you'd had to pull up as far as the horse-ferry and down again with the ebb running like a chain all the while, you'd not be in such a hurry.'

'Go on and get your dram, Anthony Williams,' the other woman interposed. 'You're poor souls, all you men, with no pluck in you till you're heartened up.—Go along with you now, and get it over quickly.'

If this taunt was intended to withhold the boatman from the inn and to induce him to start at once, it failed of its effect, for Anthony slouched off in the direction of the *Lugger* without attempting a reply; and it was twenty minutes before he returned and cast off the moorings of the boat.

With a few powerful strokes of the oars, Anthony got the boat headed well up the harbour, and then bade his son, a lad who had been waiting in the town for his father's arrival, to put the sail up. This was no sooner done than the wind struck the stretched canvas with the force of a battering-ram, causing the boat to heel over till the gunwale was but a hairbreadth above the water. At the same moment showers of spray were torn from the crests of the waves and flung over the boat, drenching the passengers from head to foot. Susan seized a dipper and began to bale; but there was no danger, and the boy laughed exultantly from the new pleasure of driving through the rough sea so surprisingly fast. The church lay behind them already; almost before they saw it they were off the timber-yard, and in another moment that also lay behind them and the new quay slipped quickly by. The boy sat holding the sheet in his hand; he dared not fasten it, for if at the very moment when that sharp hissing, like the pattering of rain, ran along the water, he had not let out sail, the squalls would have capsized the boat most infallibly.

'You boy,' Anthony shouted, after one of these sudden gusts, 'take care that sheet doesn't get jammed, or as sure as God's in heaven, we shall be drinking salt water in five minutes.'

They were within sight of the point at which Anthony intended to tack, when suddenly the sail fell flapping against the mast and the boat quivered and seemed suddenly to lose way. Instantly, almost before they realised the wind had suddenly chopped round, the boat was rolling in the trough of the sea, and the waves breaking over her threatened momentarily to sink them. Anthony cursed loudly; and while he tugged and strained at the oars in order to get the boat's head round, he shouted to his son to lower the sail, and to his passengers to bale for their lives. The boy was perfectly cool, and managed to drop the sail incredibly quickly; and Anthony having succeeded in getting the boat round, their imminent danger was past, almost before Susan understood that she had been nearer to death than she would ever be again until that day when the last barrier

of all is broken and the step taken which can never be retraced.

She had quite sufficient experience in the management of a boat to understand, however, that the chances of their reaching Polruan or being driven out to sea were something less than even. Young Williams had seized the other pair of oars, and was strong and muscular for his age, while his father was a man of immense power; but their united efforts served only to keep the boat's head straight. They seemed to make no progress. After a quarter of an hour of strenuous exertion, Susan, marking their course by the lights of the ships anchored in the harbour, noticed that they had perceptibly lost ground. Anthony also had evidently observed this; for he began to glance uneasily over his shoulder, and to tug more heavily at the oars, throwing back his immense chest with a vigour that showed he felt the need for every power he possessed.

Still the boat slipped slowly down the harbour; and it was manifest to every one on board that the position was growing serious. Young Williams leaned back and said something to his father, at which the latter nodded; and as they passed near a schooner which was riding at anchor, both father and son pulled vigorously with their right oars so as to pass as close to the vessel as possible, and shouted at the same moment: 'Ahoy! Heave a rope's-end this way.'

Two men ran to the bulwarks of the schooner on hearing the shout; and one of them comprehending the situation at a glance, seized a coil of rope and sent it whirling through the air in the direction of the boat. It was too late, however; the rope fell short; and as they slipped away from the friendly faces of the sailors, still moving with that deadly motion towards the open sea, where, sooner or later, unless some help reached them, they must inevitably founder, a kind of despair took possession of them all.

A strange thrill trembled through Susan's heart when, looking up towards Polruan, her eye caught the light in her uncle's window, beaming across the angry sea as quietly as if all things were at peace; and with a quick mental flash she saw him sitting in his comfortable study, a wood-fire blazing on the hearth, and Aunt Elizabeth slumbering in her easy-chair. Her mouth quivered and her eyes grew wet; for the first time her courage almost failed her. She put her weakness resolutely aside, however, and began to reckon up the chances for their lives. It needed no long head to do that. There was but one more vessel in the harbour, and unless some help came from it, they might as well lie down in the bottom of the boat at once and let the first wave swamp them.

At this moment she noticed young Williams was taking off his oilskins and his seaboots. Was it all over, then? she wondered; and was he about to try swimming, as a last chance for his life? She glanced round to see if her fellow-passenger had noticed this significant action; but the woman was apparently stupefied with fear, her head bowed between her hands, and saw nothing of what was going on. Suddenly, Anthony and his son stood up together while the boat was yet at some distance from the ship, and shouted with their full force.

There was an immediate answering hail; and as they passed within range, a rope was flung to them. It also fell short; but the lad, without the slightest hesitation, hurled himself into the sea with his whole length in the direction where it fell, and grasping it like grim death, was hauled on board by his father more than half drowned.

There was a cheer from the sailors who witnessed this plucky exploit; and in a few minutes both passengers and crew of the unfortunate ferryboat were safe on board the gunboat *Palmurus* of Her Majesty's navy. The lieutenant in command received the women with the greatest courtesy, and pressed his cabin on them for the night, offering at the same time, if they preferred it, to send a boat's crew ashore with them. Susan resolutely declined to stay; and in half an hour she found herself once more with the firm rough stones of Polruan quay beneath her feet, and a sensation of thankfulness and joy in her heart which nothing in her life had ever before aroused. She hurried up the hill towards her uncle's house, still clasping tight the precious copy of Tertullian, wet, exhausted by excitement as much as by fatigue, feeling as if she had but just awaked from a terrible dream, and was not yet in touch with reality again. When she reached the white gate, she paused to wonder whether she was really the same Susan Arthur who had stood there talking with her uncle so gaily only five hours before. Then she glanced down at the harbour, and saw in the moonlight that the storm was fiercer than ever; and trembled as she remembered how frail the hope was which an hour ago stood between her and death; and how, but for the pluck and coolness of young Williams, those waves would even then have been dashing her to pieces against the rocks.

Her uncle's windows were quite dark. She knocked, but there was no reply. He had grown tired of waiting for his Tertullian; and as he had evidently gone to bed, Susan laid the book within the porch, where it would be protected from the rain, and went home, wondering—as many wiser people than she have vainly wondered—whether it is really after all worth while to go out of one's way to do a kind action.

BOYISH FREAKS.

WHAT a strange world of his own is that in which a boy lives. His parents he can see are necessary; but they hold inconvenient theories respecting cleanliness and education, which clash sadly with his notions of pleasure and freedom. But he consoles himself by thinking when he grows up he will do as he pleases. How happy he is in the world of his imagination. Everything about him excites him to activity and mischief. He is proof against the fearful gastronomic experiments he makes on himself, and triumphs over numerous accidents and adventures with which he meets, for nothing seems to hurt him. He is ever acting on a small scale the heroes of the boys' books that fire his imagination; and he looks with wondering contempt on any calling tamer than that of a soldier, hunter, admiral, or pirate, in one of which exciting professions he will distinguish himself before long. There is a certain element of pathos in such childish yearnings, not less on account of the simplicity of the dreams,

than because of the artlessness of the methods with which their realisation is attempted.

The little fellow who was lately sent home to Liverpool by the Rhyl police commenced his quest of adventures early, being only nine years old. He left his parents on a Tuesday, walked all night, and reached Chester on Wednesday morning, drenched to the skin. Determined to put as great a distance as possible between himself and his parents, he walked straight on to Rhyl, a distance of fifty miles, in very bad weather. Here, on Thursday, he was found huddled up in a corner fast asleep, and next day was sent home.

The love of youthful adventure was further exemplified in two boys, aged respectively fifteen and sixteen, who not long since set out walking from Manchester to Liverpool. When near that city, however, their hearts seemed to have failed them, and one of them sent a postcard to his mother stating where they were and saying they had decided to return. As they were passing through Warrington on their way back, they were detained by an inspector at the police station. On the two youths were found a couple of loaded and capped pistols and ammunition, and a list of books, including *Jack Sheppard*, *Paul Girard the Cabin-boy*, *Hard Times*, and *Life in the Wilds*. The adventurers were relieved of their weapons and sent home.

It is this early devouring of cheap literature, not often so well selected as some of the books named, which leads to similar boyish expeditions to our seaport towns whence the cabin-boy or stowaway is to commence his world-dazzling career of gore and glory. Liverpool has frequently had the chance of being thus distinguished, and the landing-stage officials—who, strange to say, do not seem to appreciate the honour—have grown quite experienced in 'spotting' the embryo pirate or slaver looking about for a chance to embark. It is lucky for such young delinquents if the spirit of adventure does not lead them to appropriate other people's cash to defray expenses of preparation and the unromantic but necessary passage-money. It is not many months since two youngsters were noticed, by one of the experienced officials before mentioned, walking up and down the landing-stage in a mysterious, expectant manner. As their overcoats had a very bulky appearance, their observer became suspicious, and questioned them. The youths' unsatisfactory answers finally led to their being detained and examined. It was another instance of youthful adventure. The bulky overcoats concealed leather belts, which contained revolvers and ammunition. The would-be hunters were further provided with money and tickets for America, and confessed it was their intention to live in the backwoods. A telegram to their parents led to the youths being taken home, probably, ere long, to thank their rescuers for putting a stop to their little romance.

These youthful escapades become more serious when the actors in them have been tempted to relieve their employers' cash-drawers in order to fit out an expedition. This was the case in the next instance brought before our notice. The sandy watering-place of New Brighton, at the Mersey's mouth seems in many boys' opinions to constitute a perfectly legitimate place for enact-

ing Robinson Crusoe, and to be in a vague way associated in their minds with American prairies, the Australian bush, and Pacific island shores. Here two juvenile adventurers attracted the attention of the police to themselves by the magnificent way in which they were parting with money amongst the various amusements to be found there. They were discovered to be in possession of those dangerously fascinating toys, revolvers and cartridges, the usual 'penny-dreadful' serials, watches and jewelry, besides over thirteen pounds in cash, which they could not properly account for, so they were sent back to Birmingham to explain matters.

On another occasion, five boys, whose ages varied from ten to fourteen years, got into trouble through camping-out in the same attractive place. A policeman observed a light underneath a large overturned boat on the shore. Such an unusual circumstance at once attracted him to the spot. He peeped beneath this improvised hut, and found our five Crusoes, who had dug a hole in the sand, and entered their retreat after the manner of an Eskimo. They had placed lighted candles at different parts of the boat, and were seated on some straw eating apples, and some were singing comic songs. Here was a happy scene of romantic boyhood to be rudely interrupted by the prosaic appearance of a commonplace policeman, just as they were commencing a glorious career of camping-out. They had all run away from home, as they informed the officer, who had a deal of trouble in persuading them to come out of their wigwam.

Another lad from a manufacturing town had still more romantic ideas. Arrived in Liverpool, he first amused himself by driving about in a cab all day. His next proceeding was to rig himself out in a new suit of clothes, and of course to purchase the inevitable revolver, without which no hero is genuine. More ambitious than the usual New Brighton adventurers, he then took passage in a Manx steamer and landed in the Isle of Man. There he wandered into the interior, and found the solitude of the mountain district brought back descriptions of similar scenery in his favourite books. Our little traveller rambled about for a few days, camping-out in a primitive rough-and-ready kind of way, and evidently intended to lead the life of the hunters so fascinatingly described in boys' libraries. With this view he began to stalk the game of the country, which in that island happens to be no more wild or formidable than the mountain sheep. Whether he partook of many mutton-chops, or looked forward to arraying himself in a woolly suit in the true Crusoe style, history is silent. But as the discovery of the carcasses of several bullet-perforated sheep by farmers in the neighbourhood, led to the youthful Nimrod's arrest, we presume the want of time alone prevented him from developing into a full-bloom specimen of the lone-scout or solitary-hunter type.

The effect on the youthful imagination of melodramatic tales is still more striking in America, where both opportunity for, and examples of, similar exploits are not wanting. The miscreants brought into activity by the ten-cents tales of criminal life distinctively known as 'dime novels,' are themselves known as 'dime-novel brigands.' Three members of this class, we are told, were

brought before the police magistrate of Harlem, and were shown to have formed themselves into a band, which, after establishing itself in a mountainous district, was to carry off and hold to ransom beautiful maidens and wealthy tourists. Before making for the hills, the youthful banditti plundered the hotel in which they had passed the night; more, on principle, it would seem, than with a mere view to profit, for their booty consisted only of thirty-six bedroom door-keys. It appeared from a ledger found in their possession that they had begun business with a capital of two hundred dollars, 'made at New York.' But most of this sum had been spent before they reached the mountains; and an entry made the second day after their arrival on the scene of their intended exploits, showed that 'things already looked blue.' On the third day, the juvenile robbers found it necessary to pawn their solitary pistol; and the only act of highway robbery they succeeded in committing was the theft of some food left on the road by some workmen. Even this little adventure got them into trouble with a magistrate; but the police with good-natured contempt raised a subscription to pay their expenses back to New York. Thus the heroism of their expedition has been very effectively washed out. But while cheap sensational tales circulate amongst imaginative youths, we are not surprised to find these boy-brigands of America rivalled by the boy-burglars in this country. As it is with would-be heroes, not criminals, we are now dealing, we omit any further examples of the latter class.

Our subject receives further illustration from the effect that the exploits of the cowboys of Buffalo Bill in London and Texas Joe in Liverpool produced on many of our juveniles. To be a cowboy became the rage, and every lad who could get hold of his mother's clothes-line for a lariat or his father's wide-awake for a sombrero practised throwing the lasso, till not a dog could prowl the streets without a good chance of being suddenly 'yanked' off its legs by a flying rope. The shrill yells of these lads and the loud cracks of their toy-pistols, making day and night hideous, acted as a continual advertisement for the Wild West Show. Numberless letters were written by schoolboys modestly offering to join the cowboy troupe. One Liverpool lad wrote: 'I hear every day that you wants boys So I should like to see you in private. I have tried to get 3 pence to come and see you Because I am sure you would like me I can sing fence shoot I dont mean to say as I am a marksman but I know how to handle one. I am waiting for an answer.' Another says: 'I herd you wanted a few boys to join your compy. I will make a bargain with you if I suit you to do anything you may want me to do as long as you keep me in clothes and food I will go with you without wagers except a few pence for pocket-money.'

The majority of the epistles represent more than one applicant, one of them being signed by no fewer than eight lads. Two other youths wrote: 'We would like to go back with you to America and if you refuse us we should feel it greatly. . . . We like the cowboys their ways and deeds very much indeed. Please dont refuse us and believe us both to be two true cowboys

on your permission.' The picturesque costume of the ladies of the troupe seems to have proved alluring to a few of their own sex, who expressed their willingness to abandon a dull life in Liverpool for the dangers and excitements of a sojourn in the Far West, and offered themselves as wives for the cowboys. Such are a few extracts from letters of many who are eager to forsake friends and country in order to seek adventures of which they have only been accustomed to read in thrilling romances. The fact that these applicants' services were not needed will doubtless be a source of satisfaction to most of them in years to come.

The youth who lately provided himself with dagger, revolver, and bowie-knife, and commenced his journey Wild Westward by travelling from London to Liverpool, is another instance of this fascination.

Not long since two youngsters disappeared from Hull, and it was suspected that they had made their way to Liverpool. A detective on their track stopped the two runaways as they were leaving a shipping office where they had taken passage for Texas. They had evidently made up their minds to embark on a regular buccaneering expedition, as they were fully armed with revolvers, daggers, and large knives, and were provided with watches and money.

But it is sea-adventures that are naturally more attractive to the youths of this country than the exploits of hunters, scouts, or cowboys. Few young would-be Crusoes show such determination in running away to sea as the Birkenhead boy, who, when only five years old, hid himself away on board a Dublin steamer, and since then had stowed away to Ireland five times. He had also been caught on board the Isle of Man steamers. He then disappeared, and it was found that he had stowed away on the *City of Chester*, and had gone to New York. There he was captured, and sent home. Although only eight years old, his mother is in constant fear he will run away again. Some months ago he stowed away on one of the Hall line boats, such is his love for the sea. He is a sharp promising boy, though a regular rambler, and the magistrate, to whom the mother had applied for advice, gave him a chance of behaving better by making him return to school.

But some of these youths were quite eclipsed in daring recklessness by a fisherman's son, a youngster in his teens, who rowed a boat from a harbour on the south coast of England, and calmly proceeded to board a pilot cutter that at the time had no watch on board. Although it was blowing hard, he managed to hoist the sails, and before long was flying down the Channel. It was a couple of days or so ere he was discovered, though the boat being observed to behave in rather an unseamanlike manner, albeit the youth had handled her wonderfully all things considered. What his feelings were during those hours of solitary cruising, we do not know, nor how he managed to feed, keep watch, sleep, and navigate all by himself; but boys have an extraordinary faculty for enjoying themselves whenever there is a spice of danger or hardship. However, his happiness was no doubt complete when he observed the sails of the pursuing pilot-boats which eventually appeared in his wake. Before they overhauled and brought him back, he would pro-

bably at the time enjoy all the excitement of fancying he commanded a crack piratical craft, and was crowding all sail to escape a squadron of men-of-war.

But as curious an adventure of boy-voyagers is that with which we conclude. One foggy night a Thames police galley was pulling off the shore of North Greenwich, when the inspector in charge made out a boat in the mist which seemed to be in inexperienced hands. On running alongside the boat, she was found to contain four boys, none of whom were over fifteen years of age. It was a late hour in December for lads to be amusing themselves in a small craft, so the inspector asked them what they were doing there. The boys said they had been lost in the fog, which was very dense about this time, and further added, that they had come from Blackfriars, and were making their way to Gravesend, when they lost their bearings. Some parcels were observed in the boat, and the inspector inquired what was in them. They replied that one contained biscuits, but they did not know what was in the others. On this the inspector opened the parcels, and among other things found a pistol, a quantity of bullets, some powder in a flask, a box of percussion caps, a quantity of biscuits, a box of stationery, a packet of candles and some matches, a teapot, a teakettle, a lock with fittings, a bullet-mould, a small compass, a song-book, and several copies of boys' illustrated serials. On one of the lads was found a revolver; and, strangest of all—since it revealed the project of the youths—in the pocket of another of them was found a letter ready for posting, addressed to the lad's parents, and telling them that he and his companions were off for a voyage to Australia. Thus it appeared that this small fogbound boat in charge of four boys was actually on her way to the other side of the world when encountered by the police galley. The adventure finished in the unromantic precincts of a police station; but as the affair proved to be merely a boyish freak, the lads were cautioned against such foolishness and discharged.

The 'penny-dreadful' portion of the boat's equipment probably accounted for this attempted voyage; but one would think boys of their ages, however ignorant, could scarcely imagine that Australia was to be reached in a small open row-boat. After this exploit, it will be hard to know where to draw the line at youthful credulity. These lads being armed with a pistol, suggests their belief in the existence of pirates, and their resolution to cover themselves with glory by rescuing lovely captives from the whiskered villains' plunder-stored caves. We can imagine their secret and eager consultations, and self-denial in saving their pocket-money, ere their preparations were complete. But what ideas could these boys have of the awful distance and dangers of the projected voyage in a small wherry, unprovided even with fresh water? Their sheer incapacity to grasp in the faintest degree the character of their insane project is enough to make one class these boys with lunatics, did we not remember that in youth, romance goes first and preparations are entirely secondary. The sentiment of adventure is a passion in youth. Romance leads the way, and enthusiasm smiles on the cold suggestions of foresight and prudence. Is it not

sometimes as well that it should be so? and though we laugh at such childish expeditions, may not the enthusiasm which undertakes them prove the germ of the same old spirit which animated the death-defying adventurers who have made this country renowned, and to whose names on the roll of fame we can point with pride and triumph?

COLOUR-BLINDNESS IN THE MERCANTILE MARINE.

It is now fully ten years since the colour-test system was introduced into the British mercantile marine; and public attention has again been drawn to the surprising prevalence of colour-blindness among our sailors by the recent issue of a Report on this interesting and important subject by the Assistant-secretary of the Marine Department of the Board of Trade. Certain of the tests for colour-blindness used in the examination of candidates for the responsible positions of masters and chief-officers appear simple enough. It is, however, really astonishing how large a percentage of candidates are unsuccessful in obtaining certificates, breaking down where it might be naturally conjectured there could be little or no possibility of mistake. It is instructive to note, in the long list of failures since the year 1884, that, in an apparently simple test, in which the candidate is requested to describe the colour of a light exhibited in a dark room, the standard green colour was pronounced red in one hundred and seven cases out of one hundred and eighty-nine.

This matter appears the more serious when it is remembered that red and green have been selected and universally adopted as the port and starboard lights for vessels, with the express object of preventing collisions on the highways of the sea. On the discernment of those vivid and warning lights during the darkness of the night, the safety of valuable life and property depends. It is doubtless because of their strong and decided contrast that railways and ships display the red and green lights, and yet we are confronted with the startling fact, that these are the most conflicting and confusing of all colours to those whose visual organs are defective. It was ascertained, on the examination of the pilot in whose charge was the *City of Austin*, when she foundered in the harbour of Fernandina, Florida, thereby occasioning a loss to the owners of forty thousand pounds, that he could not distinguish difference in colours at a distance of over six feet, a fact that at once accounted for his mistaking the buoys, which, had he been able to read their guiding colours, would have acted as so many finger-posts pointing out the certain path of safety.

It has been said on the highest authority that colour-blindness affects at least four per cent. of all civilised peoples. In a Report presented some years since to the Committee of the Ophthalmological Society by its secretary, it is stated that out of eighteen thousand and eighty-eight persons examined—including five thousand members of the metropolitan police—upwards of seven hundred were found to be absolutely colour-blind. At another examination of engine-drivers, out of nine thousand two hundred, no fewer than four

hundred came under the same category. It goes without saying that the safe working of railway traffic is almost entirely dependent upon the use of red and green signals, and these two colours were, in the examination above alluded to, the very ones about which there was the most confusion. Such a state of things requires no comment.

It is worthy of mention, and certainly curious, that this visual defect prevails more commonly among males than females, the difference being in the proportion of about twelve to one. A remarkable instance of the inability to distinguish red from green was related by the late Professor George Wilson, who was anxiously consulted by a tailor's foreman. He informed the physician that he was suffering from a defect, of the existence of which he had only become conscious since his promotion to his present post, when, for the first time, he had to match colours for the journeymen. He was soon plunged into painful difficulties. The scarlet back of a livery waistcoat was provided with green strings to *match*; a ruddy brown was put side by side with a dark green; a customer was confidently informed that a red and blue stripe on a piece of trouser-cloth was all blue; and in general, greens were confounded with reds, and browns and crimson with blue. The distracted foreman was hopelessly mixed up. He sent the professor examples of his 'matches,' which displayed a colour-blindness of an embarrassing nature. These 'matches' were accompanied by a letter, in which he said: 'Perhaps you will be able to discover where the fault lies, and to give me some advice in the matter. Shall be happy to forward any reasonable charge, and at the same time feel greatly indebted to you, for if I do not improve, I must certainly go out of the business.'

We are unable to say what the result was; but we give the narrative as an example of a good eye for form and outline—the foreman being an excellent cutter—accompanying blindness to colour.

In October 1885, a circular letter was forwarded by the Board of Trade to the governors of the various training ships, requesting to be furnished with exact results of the colour-test as applied on their respective vessels. Out of an aggregate of seven hundred and twenty-seven intending officers and seamen on three of these vessels, twenty were found to be extremely weak in colour-sense; and one candidate, a cadet of two years' standing, so utterly deficient as to necessitate his immediate removal.

The examinations in colours are conducted both by daylight and by artificial light. Cards are used by daylight, consisting of five of each of the following colours—namely, white, black, red, pink,* green, drab,* blue, and yellow. The cards are shuffled. The examiner then holds up each card separately and asks the candidate to name the colour; and if the latter does so unhesitatingly, he is regarded as having passed the daylight test. Should the candidate, however, hesitate in any of his answers, so as to raise a doubt in the mind

of the examiner as to his ability to readily distinguish colours, the examiner distributes the cards upon the table and requires the candidate to select all cards of a colour or colours he may name. This being done, the cards are again mixed, and the candidate is required to sort the cards into eight heaps, putting all cards of one colour into each heap. The result is then duly noted.

In the examination by artificial light, a lantern lighted by kerosene and provided with nine slides of coloured glass, is used. These colours are as follows: Red (standard); pink or salmon; green (standard, or No. 1); green (bottle, or No. 2); green* (pale, or No. 3); yellow; neutral*; blue (standard); and blue (pale). The candidate is introduced into a dark room; the lamp is then lighted and placed in the lantern, the candidate seated or standing at least fifteen feet from the front and opening of the lantern. He is first asked—the lantern having no slide in it—if he can see any colour; and if so, what colour. The slide with the ground glass is then put into the opening at the front of the lantern, and the candidate is asked the same question. The slide with the ground glass being left in, and the coloured slides placed one by one and separately in front of it, the candidate is asked in each case to name the colour or tint. The replies are duly recorded; and this comprises the whole of the examination.

Physicians in America, it is said, attribute the defect of colour-blindness to inordinate smoking; but however this may be, colour-blindness is largely attracting the attention of the medical faculty; and the general consensus of professional opinion seems to point in the direction that this lamentable defect, which has already cut short the aspirations of many otherwise promising and intelligent young officers, is incurable. While it is quite possible that partial colour-blindness may be improved by assiduous practice, it is to be feared that total colour-blindness is a radical and unalterable defect, upon which the efforts of our present scientific knowledge are altogether wasted and thrown away.

NOCTURNE.

In perfect rest the garden lies;
The heavy tree that fills the skies
Is silent as the tiniest flower;
And only on the stillness dies
The honeyed chime that tells the hour.

Ah! would at yonder casement bright
That shade might flit, so dear to me,
Or swiftly glance athwart the night,
To give me greeting tenderly,
Here in the dark, where none could see.

Alas! those panes but strangely glow,
Nor cast my soul a cheering ray;
The eyes of distant friend or foe
Are cold and comfortless as they,
And she I love is far away.

J. S. MILLS.

* The cards and glasses against which an asterisk is placed in the list are what may be called 'confusion tints.' The candidate is not regarded as having 'failed' if he miscalls these tints, provided that he names all the others correctly.

ACROSS THE LAMMERMOORS.

It is a bright autumn morning, and our new Quadrant tricycle stands at the door, well oiled and ready for a journey. We propose to take a run from Edinburgh southward over the Lammermoors by the old Dalkeith Road. It is interesting to remember that this has been a great highway literally since the dawn of history. It was originally a Roman road, and formed for centuries the chief thoroughfare to the eastern Border and to England. Scottish armies, English armies, priests, pilgrims, Stewart kings, Covenanting lairds, Cromwell's troopers, Prince Charlie's men—how much of our country's history is suggested by the old road! About sixty years ago it was greatly improved by Telford, the celebrated engineer; and from then until the introduction of railways, was daily traversed by upwards of a dozen stage-coaches, and also by the 'curricie' which conveyed the mails from Edinburgh to London in about forty hours—all things considered, a wonderful speed. When the curricie approached any place where field-labourers were working, they would fling down their hoes and run to the roadside to see it pass. In addition to these vehicles, there were the heavy goods-wagons of Howey & Co. and other firms going to Newcastle and Yorkshire; besides numerous carriers' carts, so that there was not a busier road in the country. Now, all this is changed, and we meet very few horses, which is perhaps as well, for the equine race is not yet thoroughly reconciled to the tricycle.

The road is very undulating; for many miles it crosses all the valleys at right angles. The Saturday-afternoon pedestrian will remember the descent to Cameron toll, then the rise to Craigmillar, the descent again to the Burdiehouse Burn, and the stiff 'brae' beyond. But for every brae up which he toils, the tricyclist knows there is a corresponding brae down which he glides delightfully without any effort. Still, the ascent immediately beyond Dalkeith from the level of the Esk to the top of the Camp Hill is sufficiently trying, and although only two miles, it feels as

if it were a dozen. The top is, however, reached at last, and off we go down the other side at ten miles an hour. At the foot is a fine viaduct over the Tyne—one of Telford's masterpieces—having five arches, each upwards of ninety feet high, and with fifty feet of span.

We are now at the village of Pathhead, which consists of a single very steep street, up which lies our road. When we reach the top we come to a fine stretch beneath an archway of old trees, with the pleasant fields, now cleared of grain, on each side. The tendency of the road is still upwards, and at Blackshiels—fourteen miles out—we are no less than eight hundred feet above the sea. The time taken has been two hours. We are now close upon the hills, and are in sight of the heather. Soutra, in front, rises like a cliff, along whose face the road is cut diagonally. This piece of road is the steepest we have come to yet, but luckily it is not very long, and we are cheered by the knowledge that after this our course is all down hill. There are very few places where a road across the Lammermoors is possible; thus the range formed an invaluable natural defence to the Lothians. The railway to Melrose and Carlisle (the Waverley route) crosses a few miles to the west of this through a curious notch in the hills, at a much lower elevation than Soutra; but up to about a hundred years ago, this western pass was very little used, owing to the marshy nature of the ground and the number of marauders who frequented the district. For some reason or other, robberies on the Soutra road were fewer, possibly because of the number of vehicles and pedestrians continually traversing it.

The top of Soutra is upwards of twelve hundred feet above the sea, and the highest point in the road about eleven hundred. Near the summit, by the roadside, is a welcome spring of clear cold water called Trinity Well. A hind who has just quenched the thirst of himself and his horses, says: 'There's nae water like that atween here and Cheviot;' and it thoroughly deserves his commendation. Here we rest a few minutes to enjoy the view, which is enchanting. As the day

is clear, we can see, northward of us, Traprain Law, the Bass, Arthur's Seat, the Pentlands, Edinburgh Castle, the spires of the distant city, the variegated landscape which intervenes, the Firth, and beyond, the hills of Fife, with a suggestion of the Grampians on the extreme horizon.

Turning southward, we see the road stretching across the moorland plateau which forms the top of the hill. On either hand there is no sign of cultivation; but at this season we see miles of purple heather. The runlets seem undecided whether they will flow to the Firth of Forth or to the Tweed. On this wild moor stood the ancient church and village of Soutra. The village was a place of great resort, as a hospital for the relief of pilgrims and travellers had been founded here in 1164 by Malcolm IV., who richly endowed it with lands and gave it the right of sanctuary. In course of years it became one of the wealthiest hospitals in Scotland. Gradually, however, during the troublous times the hospital fell into decay, and its endowments were transferred in 1462 to Trinity College and Hospital in Edinburgh. After the removal of the hospital the village became deserted and ruinous: a few green mounds are all that now mark its site; while a single aisle used as a burial-place is the only memorial of the church. Near this is a piece of ground called the Bede-man's Acre, which was granted by James V. to a family named Pringle who lived here, and had hospitably entertained the monarch while travelling incognito. About half a mile south is the King's Inch, a common a few acres in extent, which has been used by drovers as a resting and feeding place for their cattle from time immemorial.

Pursuing our journey we come to Lowrie's Den, a solitary house by the roadside, which Sir Walter Scott—who knew it well—might have taken as the prototype of Bessie Maclure's house in *Old Mortality*. It was formerly a small inn, and was the scene of a murder at the beginning of the century. Two gypsies had quarrelled while drinking in the kitchen. During the struggle, one of them drew a knife; his wife called out, 'Strike laigh [low], Rob!' which the ruffian did, stabbing his victim to the heart. The murderer at once fled. Sir Walter Scott—then a young man—coming up at the time, gave chase, and after following him a couple of miles, he was captured with the help of a neighbouring blacksmith, and handed over to the authorities, by whom he was afterwards tried and hanged. Even before this, however, the place had a sinister reputation: several packmen or pedlars had mysteriously disappeared. No clue to their fate was got until one warm summer, many years after, the goose-dub or small pond opposite the door became completely dry and exposed a number of human bones, revealing the gruesome secret.

It was on the moor to the east of this that, in September 1745, the people while busy 'casting' peats for winter fuel were astonished by the unwonted spectacle of a number of dragoons threading their way through the moss 'hags.' These were some of Sir John Cope's cavalry, who had fled from Prestonpans, and having lost their bearings, asked in what direction Coldstream lay. On this being pointed out, they rode off as quickly as their tired horses could carry them, much to the relief of the peasants.

After two miles of the straight level road along the top, we come to the lip of the Red Brae, and then descend for upwards of other two miles at a good speed, time something under ten minutes. This Red Brae is beautifully graded, being a fine steady slope, just the right inclination to get the full safe speed out of the machine. From the head of the Brae, all Lauderdale is visible, as well as most of the Merse and Teviotdale, and in the distance, Cheviot's mountains blue.

At the foot of the descent is Carfrae Mill Inn, a welcome sight, for hunger now begins to assert itself. It is among the hills, is built where two small valleys converge, their burns uniting before the house. The view from the door, looking down the glen where the little bridge spans the stream, and the tiny hamlet beyond sends up its smoke, with the hills green to the top on every side, makes a pleasant picture. This rural paradise, although only twenty miles from Edinburgh, is almost unknown to the citizens, and yet there are few places even in the Highlands with finer scenery or better fishing; and this possesses in addition the nameless charm peculiar to the Border land.

For some miles the solitude of the dale is only broken by a few farmhouses; but from the marks of ruins here and there, the population at one time must have been much greater. The numerous remains of British camps seem also to show that even in the period before historical records there were more inhabitants in the district than now. Under the pressure of bad times and low prices, the large farms characteristic of the dale are no longer profitable, so that there is a tendency to break them up into smaller holdings, and this may result in the population again increasing.

The road follows the Leader—now a fine trout-ing stream—for some miles, and gradually the valley becomes better cultivated and more wooded. At the same time, as we are descending from the tableland of the Lammermoors, the hills on each side apparently become higher, although it is really the valley that is getting deeper. This part of the road is said by tradition to be the work of the Romans—it seems with some truth, for in course of making the improvements sixty years ago, portions of the original Roman pavement were come upon.

We now arrive at the small gray town of Lauder, with its old-fashioned 'harled' houses and slated roofs. It is a neat tidy place, and being far from railways and but little visited, is a characteristic specimen of an old Border town. The burgesses, who have the right of cultivating the town common, are a fairly thriving and industrious people. This is perhaps the last surviving instance in Scotland of the village commune, as the burgh is absolute proprietor of the common, which extends to seventeen hundred acres.

The slope of the road being still downward, we are able with little effort to keep up a good speed, accomplishing the seven miles between Lauder and Earlston in forty minutes. On the way we pass St Leonards, where lived in his old age Nicol Burn, the last of the race of ancient minstrels, and author of the fine song, *Leader Haughs and Yarrow*, which Robert Chambers says 'has evidently acted as an inspiration and

model to Wordsworth in his exquisite series of poems beginning with *Yarrow Unvisited*. These Border minstrels wandered about the country reciting the ballads which were afterwards rescued from oblivion by Sir Walter, and in return were hospitably entertained by their listeners. Burn died about one hundred and fifty years ago. It is interesting to note that Robert Burns is not the first of the name who was inspired by the muse. Further on is Blainslie, which gives its name to a species of oats now no longer grown here, but still cultivated, and much appreciated under the old name, in Aberdeenshire.

The next place is Cuddie's Ha', the reputed dwelling-place of St Cuthbert, when, as a boy, twelve hundred years ago, he herded sheep on the green hills by the banks of the Leader. It is only a humble cottage by the wayside, and yet it must be one of the oldest seats of human habitation in the country. We are now at the beautiful Carolside Brae, where, according to Thomas the Rhymer, the horse 'was to gang until the girth gawed [cut] its side in twae.' The road here is made along the face of a steep hill, a considerable height above the Leader, which winds through the green haughs below. The banks are gay with foxglove and marguerites, interspersed between great clumps of broom, some of which must be ten feet in height.

The next few miles down the valley are not surpassed for richness and variety by any scenery in the south of Scotland. In addition, it is the very core of the classic land of the Border, the home of Thomas the Rhymer, a vale whose charms have been celebrated in *The Broom o' the Cowdenknowes* and many other songs. After passing Carolside, where Kinglake wrote a portion of his *History of the Crimean War*, we come to Lowrie's Lowp (Leap), so called from an unfortunate huntsman, who, galloping down the hill and unable to restrain his horse, fell over the deep cliff into Leader and was killed. On the opposite side is Kedzlie, where the story is still told of how the guidwife had to make broth in the washing boiler and in all the available pots about the house for Prince Charlie's famishing Highlanders.

A few other traditions of the '45 still linger. One is to the effect that the barefooted Highlanders, while able to walk almost any distance over the springy turf of the north, suffered very much from their march along the hard Soutra road. They molested no man further than to deprive him of his shoes; in fact, after they passed down, it is said there was not a pair left in Lauderdale. The people of Earlstoun, when they heard of the clansmen's approach, hid in the Howe o' the Hope, a curious hollow a little above the road, which had been always the resort of their ancestors in times of danger; but they were unluckily discovered, and also deprived of their brogues. It was a peculiarity of all the Border villages, and a necessity of their position in a district constantly visited by war, to have a 'lair' or hiding-place, known only to the initiated; and this is the last occasion on which the Earlstoun one was used. But the Howe o' the Hope was also utilised by another section of the community. The witches from far and near assembled here every Halloween at midnight,

and danced to the strains of the bagpipes, which were played by an awesome personage; a scene somewhat similar to that described by Burns in *Tam o' Shanter*. For all any one can tell, this may be witnessed yet; nobody has ever had the rashness to put the story to the proof. A spring near at hand is still known as the Witches' Well.

We have now travelled together for thirty-two miles, and perhaps it is time to stop. Earlstoun is a pleasant little town; and we cannot do better than rest here, making our way back to Edinburgh to-morrow by the well-known Gala Water Road, invigorated and strengthened by our two days' run on the tricycle.

THIS MORTAL COIL.

CHAPTER XIX.—AU RENDEZVOUS DES BONS CAMARADES.

In the cosy smoking-room of the Cheyne Row Club, a group of budding geniuses, convened from the four quarters of the earth, stood once more in the bay-window, looking out on the dull October street, and discussing with one another in diverse tones the various means which each had adopted for killing time through his own modicum of summer holidays. Reminiscences and greetings were the order of the day. A buzz of voices pervaded the air. Everybody was full to the throat of fresh impressions, and everybody was laudably eager to share them all, still hot from the press, with the balance of humanity as then and there represented before him.—The mosquitoes at the North Cape were really unendurable: they bit a piece out of your face bodily, and then perched on a neighbouring tree to eat it; while the midnight sun, as advertised, was a hoary old impostor, exactly like any other sun anywhere, when you came to examine him through a smoked glass at close quarters.

Cromer was just the jolliest place to lounge on the sands, and the best centre for short excursions, that a fellow could find on a year's tramp all round the shores of England, Scotland, Wales, or Ireland.

Grouse were scanty and devilish cunning in Aberdeenshire this year; the young birds packed like old ones; and the accommodation at Lumphanan had turned out on nearer view by no means what it ought to be.

A most delightful time indeed at Beatenberg, just above the Lake of Thun, you know, with exquisite views over the Bernese Oberland; and such a pretty little Swiss maiden, with liquid blue eyes and tow-coloured hair, to bring in one's breakfast and pour out coffee in the thick white coffee-cups. And then the flowers!—a perfect paradise for a botanist, I assure you.

Montreal in August was hot and stuffy, but the Thousand Islands were simply delicious, and black-bass fishing among the back lakes was the only sport now left alive worthy a British fisherman's distinguished consideration.

O yes; the yacht behaved very well indeed, considering, on her way to Iceland—as well as any yacht that sailed the seas—but just before reaching Reykjavik—that's how they pronounce it, with the *j* soft and a falling intonation on

the last syllable—a most tremendous gale came thundering down with rain and lightning from the Vatna Jökull, and, by George, sir, it nearly foundered her outright with its sudden squalls in the open ocean. You never saw anything like the way she heeled over: you could touch the trough of the waves every time from the gunwale.

Had anything new been going on, you fellows, while we were all away? and had anybody heard anything about the Bard, as Cheyne Row had unanimously nicknamed Hugh Massinger?

Yes, one budding genius in the descriptive-article trade—writer of that interesting series of papers in the *Charing Cross Review* on Seaside Resorts—afterwards reprinted in crown octavo fancy boards, at seven-and-sixpence, as *The Complete Idler*—had had a letter from the Bard himself only three days ago, announcing his intention to be back in harness in town again that very morning.

‘And what’s the Immortal Singer been doing with himself this hot summer?’ cried a dozen voices—for it was generally felt in Cheyne Row circles that Hugh Massinger, though still as undiscovered as the sources of the Congo, was a coming man of proximate eventuality. ‘Has he hooked his heiress yet? He vowed, when he left town in July, he was going on an angling expedition—as a fisher of women—in the eastern counties.’

‘Well, yes,’ the recipient of young love’s first confidences responded guardedly; ‘I should say he had.—To be sure, the Immortal One doesn’t exactly mention the fact or amount of the young lady’s fortune; but he does casually remark in a single passing sentence that he has got himself engaged to a Thing of Beauty somewhere down in Suffolk.’

‘Suffolk!—most congruous indeed for an idyllic, bucolic, impressionist poet.—He’ll come back to town with a wreath round his hat, and his pockets stuffed with ballades and sonnets to his mistress’ eyebrow, where “Suffolk punches” shall sweetly rhyme to “the red-cheek apple that she gaily munches,” with slight excursions on lunches, bunches, crunches, and hunches, all à la Massinger, in endless profusion.—Now then, Hatherley; there’s a ballade ready made for you to your hand already. Send it by the first post yourself to the lady, and cut out the Bard on his own ground with the beautiful and anonymous East Anglian heiress.—I suppose, by the way, Massinger didn’t happen to confide to you the local habitation and the name of the proud recipient of so much interested and anapestic devotion?’

‘He said, I think, if I remember right, her name was Meysey.’

‘Meysey! Oh, then, that’s one of the White-strand Meyseys, you may be sure; daughter of old Tom Wyville Meysey, whose estates have all been swallowed up by the sea. They lie in the prebend of Consumptum per Mare.—If he’s going to marry her on the strength of her red, red gold, or of her vested securities in Argentine and Turkish, he’ll have to collect his arrears of income from a sea-green mermaid—at the bottom of the deep blue sea; which will be worse than even dealing with the Land League, for the Queen’s writ doesn’t run beyond the fore-

shore, and No Rent is universal law on the bed of the ocean.’

‘I don’t think they’ve all been quite swallowed up,’ one of the bystanders remarked in a pensive voice: he was Suffolk born; ‘at least, not yet, as far as I’ve heard of them. The devouring sea is engaged in taking them a bite at a time, like Bob Sawyer’s apple; but he’s left the Hall and the lands about it to the present day—so Relf tells me.’

‘Has she money, I wonder?’ the editor of that struggling periodical, the *Night-Jar*, remarked abstractly.

‘Oh, I expect so, or the Bard wouldn’t ever have dreamt of proposing to her. The Immortal Singer knows his own worth exactly, to four places of decimals, and estimates himself at full market value. He’s the last man on earth to throw himself away for a mere trifle. When he sells his soul in the matrimonial Exchange, it’ll be for the highest current market quotation, to an eligible purchaser for cash only, who must combine considerable charms of body and mind with the superadded advantage of a respectable balance at Drummond’s or at Coutts’s. The Bard knows down to the ground the exact money-worth of a handsome poet; he wouldn’t dream of letting himself go dirt cheap, like a common every-day historian or novelist.’

As the last speaker let the words drop carelessly from his mouth, the buzz of voices in the smoke-room paused suddenly: there was a slight and awkward lull in the conversation for half a minute; and then the crowd of budding geniuses was stretching out its dozen right hands with singular unanimity in rapid succession to grasp the languid fingers of a tall dark new-comer who had slipped in, after the fashion usually attributed to angels or their opposite, in the very nick of time to catch the last echoes of a candid opinion from his peers and contemporaries upon his own conduct.

‘Do you think he heard us?’ one of the peccant gossipers whispered to another with a scared face.

‘Can’t say,’ his friend whispered back uneasily. ‘He’s got quick ears. Listeners generally hear no good of themselves. But anyhow, we’ve got to brazen it out now. The best way’s just to take the bull by the horns boldly.—Well, Massinger, we were all talking about you when you came in. You’re the chief subject of conversation in literary circles at the present day. Do you know it’s going the round of all the clubs in London at this moment that you shortly contemplate committing matrimony?’

Hugh Massinger drew himself up stiff and erect to his full height, and withered his questioner with a scathing glance from his dark eyes such as only he could dart at will to scarify and annihilate a selected victim. ‘I’m going to be married in the course of the year,’ he answered coldly, ‘if that’s what you mean by committing matrimony.—Mitchison,’ turning round with marked abruptness to an earlier speaker, ‘what have you been doing with yourself all the summer?’

‘Oh, I’ve been riding a bicycle through the best part of Finland, getting up a set of articles on the picturesque aspect of the Far North for the *Porte-Crayon*, you know, and at the same time working in the Russian anarchists for the leader column in the *Morning Telephone*.—Bates went

with me on the illegitimate machine—yes, that means a tricycle; the bicycle alone's accounted lawful: he's doing the sketches to illustrate my letterpress, or I'm doing the letterpress to illustrate his sketches—whichever you please, my little dear; you pays your money and you takes your choice, all for the small sum of sixpence weekly. The roads in Finland are abominably rough, and the Finnish language is the beastliest and most agglutinative I ever had to deal with, even in the entrancing pages of Ollendorff. But there's good copy in it—very good copy.—The *Telephone* and the *Porte-Crayon* shared our expenses.—And where have you been hiding your light yourself since we last saw you?

'My particular bushel was somewhere down about Suffolk, I believe,' Hugh Massinger answered with magnificent indefiniteness, as though minute accuracy to the matter of a county or two were rather beneath his sublime consideration. 'I've been stopping at a dead-alive little place they call Whitestrand: a sort of moribund fishing village, minus the fish. It's a lost corner among the mud-flats and the salt marshes; picturesque, but ugly, and dull as ditch-water. And having nothing else on earth to do there, I occupied myself with getting engaged, as you fellows seem to have heard by telegraph already. This is an age of publicity. Everything's known in London nowadays. A man can't change his coat, it appears, or have venison for dinner, or wear red stockings, or stop to chat with a pretty woman, but he finds a flaring paragraph about it next day in the society papers.'

'May one venture to ask the lady's name?' Mitchison inquired courteously, a little apart from the main group.

Hugh Massinger's manner melted at once. He would not be chaffed, but it rather relieved him, in his present strained condition of mind, to enter into inoffensive confidences with a polite listener.

'She's a Miss Meysey,' he said in a lower tone, drawing over towards the fireplace: 'one of the Suffolk Meyseys—you've heard of the family. Her father has a very nice place down by the sea at Whitestrand. They're the banking people, you know: remote cousins of the old hanging judge's. Very nice old things in their own way, though a trifle slow and out of date—not to say mouldy.—But after all, rapidity is hardly the precise quality one feels called upon to exact in a prospective father-in-law: slowness goes with some solid virtues. The honoured tortoise has never been accused by its deadliest foes of wasting its patrimony in extravagant expenditure.'

'Has she any brothers?' Mitchison asked with apparent ingenuousness, approaching the question of Miss Meysey's fortune (like Hugh himself) by obscure byways, as being a politer mode than the direct assault. 'There was a fellow called Meysey in the fifth form with me at Winchester, I remember; perhaps he might have been some sort of relation.'

Hugh shook his head in emphatic dissent. 'No,' he answered; 'the girl has no brothers. She's an only child—the last of her family. There was one son, a captain in the Forty-fourth, or something of the sort; but he was killed in Zululand, and was never at Winchester, or I'm sure I should have heard of it.—They're a kinless

lot, extremely kinless: in fact I've almost realised the highest ambition of the American humorist, to the effect that he might have the luck to marry a poor lonely friendless orphan.'

'She's an heiress, then?'

Hugh nodded assent. 'Well, a sort of an heiress,' he admitted modestly, as who should say, 'not so good as she might be.' 'The estate's been very much impaired by the inroads of the sea for the last ten years; but there's still a decent remnant of it left standing. Enough for a man of modest expectations to make a living off in these hard times, I fancy.'

'Then we shall all come down in due time,' another man put in—a painter by trade—joining the group as he spoke, 'and find the Bard a landed proprietor on his own broad acres, living in state and bounty in the baronial Hall, lord of Burleigh, fair and free, or whatever other name the place may be called by!'

'If I invite you to come,' Hugh answered significantly with curt emphasis.

'Ah yes, of course,' the artist answered. 'I dare say when you start your carriage, you'll be too proud to remember a poor devil of an oil and colour man like me.—In those days, no doubt you'll migrate like all the rest to the Athenæum.—Well, well, the world moves—once every twenty-four hours on its own axis—and in the longrun we all move with it and go up together.—When I'm an R.A., I'll run down and visit you at the ancestral mansion, and perhaps paint your wife's portrait—for a thousand guineas, *bien entendu*.—And what sort of a body is the prospective father-in-law?'

'Oh, just the usual type of Suffolk Squire, don't you know,' Massinger replied carelessly. 'A breeder of fat oxen and of pigs, a pamphleteer on Guano and on Grain, a quarter-sessions chairman, abler none; but with faint reminiscences still of an Oxford training left in him to keep the milk of human kindness from turning sour by long exposure to the pernicious influence of the East Anglian sunshine. I should enjoy his society better, however, if I were a trifle deaf. He has less to say, and he says it more, than any other man of my acquaintance. Still, he's a jolly old boy enough, as old boys go. We shall rub along somehow till he pops off the hooks and leaves us the paternal acres on our own account to make merry upon.'

So far, Hugh had tried with decent success to keep up his usual appearance of careless ease and languid good-humour, in spite of volcanic internal desires to avoid the painful subject of his approaching marriage altogether. He was schooling himself, indeed, to face society. He was sure to hear much of his Suffolk trip, and it was well to get used to it as early as possible. But the next question fairly blanched his cheek, by leading up direct to the skeleton in the cupboard: 'How did you first come to get acquainted with them?'

The question must inevitably be asked again, and he must do his best to face it with pretended equanimity. 'A relation of mine—a distant cousin—a Girton girl—was living with the family as Miss Meysey's governess or companion or something,' he answered with what jauntiness he could summon up. 'It was through her that I first got to know my future wife. And old Mr Meysey, the coming papa-in-law'—

He stopped dead short. Words failed him. His jaw fell abruptly. A strange thrill seemed to course through his frame. His large black eyes protruded suddenly from their sunken orbits; his olive-coloured cheek blanched pale and pasty. Some unexpected emotion had evidently checked his ready flow of speech. Mitchison and the painter turned round in surprise to see what might be the cause of this unwonted flutter. It was merely Warren Relf who had entered the club, and was gazing with a stony British stare from head to foot at Hugh Massinger.

The poet wavered, but he did not flinch. From the fixed look in Relf's eye, he felt certain in an instant that the skipper of the *Mud-Turtle* knew something—if not everything—of his fatal secret. How much did he know? and how much not?—that was the question. Had he tracked Elsie to her nameless grave at Orfordness? Had he recognised the body in the mortuary at the lighthouse? Had he learned from the cutter's man the horrid truth as to the corpse's identity? All these things or any one of them might well have happened to the owner of the *Mud-Turtle*, cruising in and out of East Anglian creeks in his ubiquitous little vessel. Warren Relf was plainly a dangerous subject. But in any case, Hugh thought with shame, how rash, how imprudent, how unworthy of himself thus to betray in his own face and features the terror and astonishment with which he regarded him! He might have known Relf was likely to drop in any day at the club! He might have known he would sooner or later meet him there! He might have prepared beforehand a neat little lie to deliver pat with a casual air of truth on their first greeting! And instead of all that, here he was, discomposed and startled, gazing the painter straight in the face like a dazed fool, and never knowing how or where on earth to start any ordinary subject of polite conversation. For the first time in his adult life he was so taken aback with childish awe and mute surprise that he felt positively relieved when Relf boarded him with the double-barrelled question: 'And how did you leave Miss Meysey and Miss Challoner, Massinger?'

Hugh drew him aside towards the back of the room and lowered his voice still more markedly in reply. 'I left Miss Meysey very well,' he answered with as much ease of manner as he could hastily assume. 'You may perhaps have heard from rumour or from the public prints that she and I have struck up an engagement. In the lucid language of the newspaper announcements, a marriage has been definitely arranged between us.'

Warren Relf bent his head in sober acquiescence. 'I had heard so,' he said with grim formality. 'Your siege was successful. You carried the citadel by storm that day in the sandhills.—I won't congratulate you. You know my opinion already of marriages arranged upon that mercantile basis. I told it you beforehand. We need not now recur to the subject.—But Miss Challoner?—How about her? Did you leave her well? Is she still at Whitestrand?' He looked his man through and through as he spoke, with a cold stern light in those truthful eyes of his.

Hugh Massinger shuffled uneasily before his steadfast glance. Was it only his own poor guilty conscience, or did Relf know all? he wondered

silently. The man was eyeing him like his evil angel. He longed for time to pause and reflect; to think out the best possible non-committing lie in answer to this direct and leading question. How to parry that deadly thrust on the spur of the moment he knew not. Relf was gazing at him still intently. Hesitation would be fatal. He blundered into the first form of answer that came uppermost. 'My cousin Elsie has gone away,' he stammered out in haste. 'She—she left the Meyseys quite abruptly.'

'As a consequence of your engagement?' Relf asked sternly.

This was going one step too far. Hugh Massinger felt really indignant now, and his indignation enabled him to cover his retreat a little more gracefully. 'You have no right to ask me that,' he answered in genuine anger. 'My private relations with my own family are surely no concern of yours or of any one's.'

Warren Relf bowed his head grimly once more. 'Where has she gone?' he asked in a searching voice. 'I'm interested in Miss Challoner. I may venture to inquire that much at least. I'm told you've heard from her. Where is she now? Will you kindly tell me?'

'I don't know,' Hugh answered angrily, driven to bay. Then with a sudden inspiration, he added significantly: 'Do you either?'

'Yes,' Warren Relf responded with solemn directness.

The answer took Massinger aback once more. A cold shudder ran down his spine. Their eyes met. For a moment they stared one another out. Then Hugh's glance fell slowly and heavily. He dared not ask one word more.—Relf must have tracked her, for certain, to the lighthouse. He must have seen the grave, perhaps even the body.—This was too terrible.—Henceforth, it was war to the knife between them. 'Hast thou found me, O mine enemy?' he broke out sullenly.

'I have found you, Massinger, and I have found you out,' the painter answered in a very low voice, with a sudden burst of unpremeditated frankness. 'I know you now for exactly the very creature you are—a liar, a forger, a coward, and only two fingers' width short of a murderer.—There! you may make what use you like of that.—For myself, I will make no use at all of it.—For reasons of my own, I will let you go. I could crush you if I would, but I prefer to screen you. Still, I tell you once for all the truth. Remember it well.—I know it; you know it; and we both know we each of us know it.'

Hugh Massinger's fingers itched inexpressibly that moment to close round the painter's honest bronzed throat in a wild death-struggle. He was a passionate man, and the provocation was terrible. The provocation was terrible because it was all true. He *was* a liar, a forger, a coward—and a murderer!—But he dared not—he dared not. To thrust these hateful words down Relf's throat would be to court exposure, and worse than exposure; and exposure was just what Hugh Massinger could never bear to face like a man. Sooner than that, the river, or aconite. He must swallow it all, proud soul as he was. He must swallow it all, now and for ever.

As he stood there irresolute, with blanched lips and itching fingers, his nails pressed hard into the palms of his hands in the fierce endeavour to

repress his passion, he felt a sudden light touch on his right shoulder. It was Hatherley once more. 'I say, Massinger,' the journalist put in lightly, all unconscious of the tragedy he was interrupting, 'come down and knock about the balls on the table a bit, will you?'

If Hugh Massinger was to go on living at all, he must go on living in the wonted fashion of nineteenth-century literate humanity. Tragedy must hide itself behind the scenes; in public he must still be the prince of high comedians. He unclosed his hands and let go his breath with a terrible effort. Relf stood aside to let him pass. Their glances met as Hugh left the room arm in arm with Hatherley. Relf's was a glance of contempt and scorn; Hugh Massinger's was one of undying hatred.

He had murdered Elsie, and Relf knew it. That was the way Massinger interpreted to himself the 'Yes' that the painter had just now so truthfully and directly answered him.

(To be continued.)

SUDDEN FORGETFULNESS.

NOT many things are more surprising than the lapses of memory one sometimes meets with in persons whose powers of mind, both natural and acquired, are considered to be much above the average. It would be folly to expect grapes from gooseberry bushes or figs from fir-trees; and it would be as preposterous to look for anything but unwisdom from the foolish; but we do expect wisdom from the wise; and above all we do anticipate expertness from the really clever. And yet, what breakdowns do happen now and again in the senate, on the platform, in the pulpit, and even on the stage; and not seldom the more skilful the person the more curious the catastrophe.

In a recently published letter of Thackeray's we have a description of the sudden forgetfulness he was subjected to at the Literary Fund dinner. He was one of the speakers, and he describes the affair as an 'awful smash.' Of the thread of his discourse he seems to have said, not in the words, but in the spirit of an old dramatist:

'Tis lost;

Like what we think can never shun remembrance,
Yet of a sudden's gone beyond the clouds.

But the experience of the author of *Vanity Fair* was far from being singular to himself. Others have got their pearls of thought and illustration into the wrong places, nay, some have even been so unfortunate as to lose both the pearls and their setting. It seems to have been a trying time for Thackeray, and he sat down afterwards and described to a friend what a fool he had made of himself; but his mother, who had contrived to be within hearing, came to the opposite conclusion.

The senate is not free from cases of sudden forgetfulness, though, in the days when it was considered out of place to use manuscript, the lapses took place much more often. Nowadays, a case seldom happens unless the notes have been disarranged or mislaid, or when the 'paper gives out.' But the thing does occur, and to front-bench men and back-bench men alike. Not long since, an ex-cabinet minister collapsed completely

from failure of memory, and he was shortly afterwards translated, perhaps by way of consolation, to the House of Peers. Only the other day, too, a member with a grievance made an 'awful smash,' to the delight of the house, through not being able to get at his notes; but he has had no consolation and little peace since.

On the stage, the prompter is the safety from forgetfulness; but in the concert-theatre, lapses take place. Even a great living tenor has been known to retire in the middle of a song he had been singing every week for almost a lifetime, because all memory of the words he wanted was gone. Such a case of sudden forgetfulness took place in one of the London theatres early in the present century. During the performance, which seems to have been of a mixed character, the gods in the galleries called for their favourite song, *The Sprig of Shillelagh*, though it was not announced in the bills; and Mr John Henry Johnstone, a well-known Irish actor and vocalist, came forward with alacrity and good-humour to comply with the wishes of the gods. Accordingly, the music played, but the singer stood silent and apparently confused. The symphony was repeated, but the same silence and confusion on the part of the vocalist took place in rather an increased degree. The symphony was performed a third time, but all to no purpose. At length Mr Johnstone came forward to the front of the stage and thus addressed the audience: 'Ladies and gentlemen, I assure you that I have sung this song so often that I forget the first line.' A roar of laughter greeted these words, and hundreds of good-humoured voices began to prompt the singer, who immediately gave the favourite song in good style, and gained increased applause.

Sudden forgetfulness is not an unusual thing in the pulpit. Aubrey the antiquary says that when he was a freshman at college he heard Dr Sanderson, Bishop of Lincoln, well known for his work, *Nine Cases of Conscience*, break down in the middle of the Lord's Prayer. Even the great French preacher Massillon once stopped in the middle of a sermon from a defect of memory; and Massillon himself recorded that the same thing happened through excess of apprehension to two other preachers whom he went to hear in different parts of the same day. Another French preacher stopped in the middle of a sermon and was unable to proceed. The pause was, however, got over ingeniously. 'Friends,' said he, 'I had forgot to say that a person much afflicted is recommended to your immediate prayers.' He meant himself. He fell on his knees; and before he rose he had recovered the thread of his discourse, which he concluded without his want of memory being perceived.

The late Rev. Henry Ware of Boston was once in a similar predicament. In the middle of a sermon his memory failed him and he stopped abruptly. The pause seemed long to the preacher before he regained his thought, and he imagined the sermon to be a failure in consequence; but as he walked quietly up the aisle, a different impression was given to him. 'How did you like the sermon?' asked one hearer of another.—'Like it? It is the best sermon Mr Ware has ever preached. That pause was sublime!'

A good illustration of this sudden forgetfulness comes from the same district of Boston. A

worthy minister there is not only absent-minded and has a short memory, but he breaks down as continually as he breaks down suddenly. To counteract this, it is a habit with him, when he forgets anything, to rise again and make a few supplementary remarks, which he always begins with the phrase, 'By the way.' One Sunday he got half-way through a prayer from memory, when he hesitated, forgot what he was about, and sat down abruptly without pronouncing the closing word. In a moment or two he rose, and pointing his finger at the amazed congregation, he exclaimed: 'Oh, by the way, Amen!'

It is said of Father Taylor, a preacher to sailors, that once, when he got confused, he cried out: 'Boys, I've lost my nominative case; but never mind—we're on the way to glory!'

We can understand a lapse of memory taking place when the mind is overburdened and unusual demands are being made upon it; but for a failure to occur when there is no stress put upon the mental powers is singular. Here is a case in point. We are told on good authority that a prominent Harvard Professor went into the old Cambridge post-office and presented himself at the place where the delivery of letters was made. He stood there silent, but apparently very confused about something. The clerk in charge inquired what he desired.—'My letters, please.'—'Name, sir?' asked the clerk.—After stammering and stuttering, the learned man said: 'I have quite forgotten my name!' The official knew the Professor, and with a smile handed him his letters.

'You will forget your own name next,' is a phrase often thrown at the stupid, and perhaps there would be some excuse for them even if they did so.

There is some consolation, however, in cases of sudden forgetfulness; the pity is that it does not come soon enough to benefit fully, and at times it is denied altogether to the actor. As for the orator, he knows afterwards that none but himself is aware of the valuable forgotten things, and the difference between the projected ideal and the actual performance. It would have been a great saving of nerve-force, and a pleasurable emotion to have thought of those two items before he had wished himself a thousand miles away, and before the room swam round, and before he burst into perspiration at every pore.

THE MYSTIC COMPACT:

A MARVEL OF MODERN SPIRIT-LIFE.

BENEDICT CLOUDESLEY was not a believer in or disciple of any system of magic or mysticism, nor was he a medium of intercourse with spirits. This fact should be clearly stated at first, as he always considered that his experience was the more remarkable from his being, as one may say, an outsider. He was not actually a sceptic; he had thought too little about such matters to have any decided opinion. He would occasionally cut a joke, after the manner of a good many other young fellows, when spiritualism was discussed, but beyond this he did not trouble himself.

It was not so with Mr Alfred Bince, his familiar friend, and a City clerk to boot, as was also our hero—to apply a title to which the latter was

far too sensible to assert any claim. But all Mr Bince's spare time was absorbed in mystic studies, and he often intimated to Benedict that even spiritualism with all its wonders—which he freely admitted and professed to be familiar with—was but meat for babes compared with the deeper secrets he had mastered. In company with a few earnest students, he had at last solved the mysteries of the ancient Egyptian and Indian magics, and expected very soon to wield their powers.

As a beginning, however, he recommended spiritualism as suitable for a novice, and was always urging Benedict to attend a séance of invitation, which appeared to be the sitting of several persons round a table awaiting the manifestations, which were sure to come if you only waited long enough. Cloudesley was a bachelor, and sometimes did not know what to do with himself of an evening, so at last he agreed to attend one of these invitation meetings—it was to be held next evening, the last night of the year, as it happened; and the result of which, his friend assured him, would be his complete conviction.

Benedict was hardly so enthusiastic at even this prospect as was Mr Bince; but he went, and a bitterly cold night it was, too—a frost, with a keen north-east wind blowing. The séance lasted about two hours, the lights being turned low, although not out, while all conversation was held in subdued tones. Nothing was heard on this first night; but the more experienced disciples explained that it was hardly ever known for the first night to be a success. There was no doubt, they said, from the powerful mediums present, that in two or three sittings they would obtain favourable manifestations.

The young man listened to this and a good deal more of the same, but was quite wearied by the dull, useless waiting, not inclined to believe in anything more turning up, and by no means disposed to attend the rest of the series. He did not tell his friend Alfred this, as he knew it would hurt his feelings; so, when they parted at a short distance from Cloudesley's house, Mr Bince promised to call for him on the next night, and predicted a brilliant success. Benedict answered with the best imitation of enthusiasm he could muster, and so they separated.

The young fellow was heartily glad to get into his own sitting-room, which, however, struck rather chilly, for the fire had been allowed to sink too low. Yet with his shudder at the cold as he took off his coat, there mingled a shudder which was of relief at having left the dreary circle wherein he formed part, and at having got clear from his friend's mystic talk, of which, as he muttered, he had had almost too much for one dose. He threw a plentiful supply of coal upon the fire, at the risk of putting it out; as he did so, the clock of a neighbouring church sounded eleven. 'Eight o'clock till eleven—three hours of penance,' he muttered. 'They talk of meeting an hour later to-morrow, the conditions being more favourable as the night advances. Let them meet if they like; they won't meet me.'

He lit his pipe, smoked in silence for a time, and thought deeply on the events of the evening. Whether he liked it or not, it was impossible for him to detach his thoughts from the subject, and his friend's arguments, wild and even ridiculous as he had fancied them, recurred with added force. 'But come what may,' he thought, 'I will never mix myself up with such an absurd lot, or be led by any arguments which my reason tells me are crazy fancies.'

'Yes, you will,' cried a voice.

This was a strange interruption, for not only was Benedict certain that there was no one else in the room, but even if there had been, as he had not uttered a syllable, the answer was actually to his thoughts.

He was a man of firm nerves, so was less startled than might have been expected. He turned, and saw a stranger quietly sitting on a chair, so placed that he, Benedict, was between him and the door, quite disproving the idea that he had just entered.

'You will believe in these people,' said the stranger; 'and I will prove to you the truth of those tales of magic at which you have sneered. I am Zafiana, the Chinese Seer.'

'Indeed!' exclaimed Benedict, who at that moment fancied he had somewhere heard the name. 'But you do not look like a Chinaman; I should have taken you for a Volunteer.' He seemed indeed to wear a kind of uniform.

'Not like such Chinese as *you* know, perhaps,' returned the visitor with a contemptuous smile.

Benedict was not acquainted with many Chinese, but this remark appeared to have great force.

'I have not been in China for many thousands of years,' resumed the stranger.

'For what?' interrupted Benedict.

'My work,' Zafiana went on, without heeding the question, 'is in the West. It was I who worked most of the effects which are recorded in the *Arabian Nights*. As recorded, they are vulgarised; but they are all true, and much beyond them. I admire your doubts and your anxiety to see the truth, so I mean to make a convert of you. You will find it easy and pleasant to become my disciple.'

'I am not much of a spiritualist,' returned Cloudesley; 'and if you will excuse my saying so, I don't care about being one.'

'That is the reason I am determined to have you,' retorted Zafiana. 'You are poor, and wish to be rich—is it not so?'

'He is right there, however he knows it,' thought Benedict, but he might just as well have spoken aloud.

'Yes; I am right,' said the stranger; 'and I am here to give you your wish.—Do you see this ring?'

Benedict was obliged to admit he did, it was so prominently displayed on his visitor's finger, although he had not before noticed it.

'That ring is yours with all its powers. You have only to turn it—thus, and any wealth you may wish for is yours. Put it on now.'

With some reluctance, Benedict allowed the stranger to fit the ring on his finger.

'Now turn it and wish for a hundred pounds.'

Despite the objection Cloudesley entertained to the whole proceeding, he could not resist this suggestion—his yearly income did not much

exceed this amount. He turned the ring, wished, and in an instant a pile of gold lay on the table at his elbow.

'My eye!' he ejaculated.

'You are satisfied?' asked Zafiana. 'Then the ring is yours—on easy conditions.'

'No!—no conditions!' exclaimed Cloudesley, who thought of the devil and Dr Faustus, with a score of similar legends. 'I will not have anything to do with them.'

'When I tell you the only condition is, that you never go into No. 77 Badoura Street, Islington,' said the visitor, 'you may judge for yourself what danger or hardship there is in my offer.'

'Badoura Street, Islington; I never heard of the place,' returned Cloudesley, after a moment's reflection.

'I knew you had not, so proposed this as the easiest condition in the world.—Will you take the ring? Unbounded wealth; a thousand years of life, youth, and health, in which to enjoy yourself—is it worth while, in exchange for these things, to say you will never go into a house you have never seen and never will see?'

'It is!' exclaimed Benedict. 'The ring is mine!'

'Then farewell.' His visitor rose as he spoke. 'You will never see me again—unless, indeed, you go to No. 77 Badoura Street.'

'If I do'—began Cloudesley; but his guest was gone; the space where he had been standing was void.

Somehow, Benedict did not feel surprised or overcome; he seemed already to regard the magic ring as a thing of ordinary life and experience. Nevertheless, he resolved to secure himself from the slightest risk of entering the forbidden house, by leaving London for good. He would go and live at Brighton, a town he was always fond of.

He gave up his situation, and secured handsome apartments at the seaside. His mind must have been more affected than he had thought, for when he tried, he could hardly recall the processes by which these changes were accomplished, and he knew or cared nothing about the friends he had left behind him. Yet these latter came, as might have been expected, so often to see him at Brighton, that it was really like still living in the old circle. The great difference was in his abundance of money, which accumulated faster than he had any need of, so that he found himself wondering why he called for it in such quantities, and, moreover, what he should do with it, as it was lying in piles about his rooms.

He made up his mind at times to give a good part of this wealth to his friend Alfred Bince, but could never carry out this intention. Something always intervened, and Alfred came and went none the richer for his visits.

Benedict was staggered, on opening his newspaper one day, to see in bold type the startling heading: 'Dreadful Murder in Badoura Street—Arrest of the Murderer.' Fascinated, he read on. It was all confused and blurred to his excited nerves; yet he could make out that the crime was of a wretched, commonplace character, shocking enough in itself, but with none of the features which make such incidents the public talk for weeks.

'I am glad,' thought Benedict, 'I do not even

know where Badoura Street is. But perhaps if I did, I should'— His unfinished reflection was one which often recurred.

He paid occasional visits to London, but took care never to go into or even near Islington. Yet the name haunted him, so that he wished the donor of the ring had never mentioned the place, but had allowed him to take his chance, as, out of the million or so of houses in London, it was nearly impossible that he should have wandered into this No. 77 by accident. He found himself speculating over and over again as to what sort of a street this was, and fancying he should like to see it from a balloon or other safe position. He thought about Badoura Street almost constantly, until he felt that it would be best for him to go and see it and have done with it. Yet he fought against the dangerous fancy, resolving sometimes that he would go to Australia or some other distant country, to break this habit of thought; when it suddenly became necessary for him to go to London to meet his friend Bince. When there, some important business in which the latter was concerned required that Benedict should go to Islington. He did not completely understand the complicated business in which Bince was engaged, yet could not refuse to attend to it; and so, for the first time since that eventful night, and for years before, he found himself in the great northern parish.

It was impossible to avoid a wish to see Badoura Street, now that he was in the neighbourhood. He knew but little of Islington; and in the vicinity of Badoura Street—for which he consulted a local map—he was an utter stranger. He determined to walk across the end of the thoroughfare, and satisfy what he felt was his unreasonable, his absurd curiosity, by a single glance down it; but to do even this, it was necessary that he should find the place.

Such a confused labyrinth of streets and houses as he now found himself amidst, he had never before seen. Dingy, dull, twisting streets—streets of which he could not see the end—streets where the houses overhung the paths and approached each other until they touched: he marvelled that so obsolete a neighbourhood was allowed to exist, and felt afraid of losing his way in such a maze.

No trace of Badoura Street could he find, although he prolonged his search until he was weary. He was annoyed with himself for this perseverance, but could not give up the search. At last, with a mingled feeling of disappointment at his want of success and relief at being unable to run into danger, he turned down a thoroughfare in what he had believed to be the immediate vicinity of his quest, in order to regain what were to him more familiar districts. This was a long street, tolerably broad, but filled with poor houses and paltry shops. He walked slowly through it, for he felt tired, amusing himself with gazing into the shabby shops as he passed, when suddenly—for he had not noticed the dense black cloud which now seemed to rest on the tops of the houses—a heavy rain-storm burst overhead. He was just in front of a small eating-house, so naturally stepped inside the doorway; and the proprietor—attracted, perhaps, by the appearance of a person above the usual run of his customers—came forward and civilly invited the stranger to enter.

Benedict, with thanks, complied, and soon got into conversation with the shopkeeper, who was not too busy for a gossip.

'I have been in search of a street in this neighbourhood,' said Cloudeley, 'which I cannot find; perhaps you may know it.'

'I have lived here these ten years,' replied the man; 'and I believe I know every inch of the parish. What street might you want?'

'I have been looking for Badoura Street,' answered Benedict, who was angry with himself, even while he spoke, for introducing the subject. 'I made sure it was somewhere about this spot.'

'It was,' said the shopkeeper; 'but there is no Badoura Street now. This was it.'

'This! This!' echoed Cloudeley. 'Why, I saw the name written up, "Royal Princess Street." How can'—

'The name was altered in consequence of a dreadful murder—the Badoura Street murder, it was called, and you may have heard of it. It gave the street a bad name, so the parish altered it; and now it is Royal Princess Street.'

'What an awful thing! What a narrow escape I have had!' muttered Benedict, who found himself turning actually hot, not cold, at the idea. 'Your house, I see,' he continued aloud, 'is No. 40. Were you near the house where?'

'O no,' interrupted the man; 'that was on the other side of the way. But numbers is no rule, sir, as they altered them too. This, for instance, used to be No. 77'—

'What!—77!' gasped Cloudeley. He faltered here, and his head and throat grew hotter.

'You don't seem well,' said the shopkeeper kindly. 'Step into this room and sit down; there is no one in there.' He opened the door of a back room as he spoke, and Benedict went in, the landlord closing the door behind him and leaving him alone.

The room struck Cloudeley as being almost stiflingly warm, while some smoke or mist rising at the further end of the apartment made it obscure. He thought the place must be on fire, the heat was so great and the smoke so dense, although, strangely enough, it did not approach him. It was so unpleasant that, even though his brain was still reeling from the shock he had experienced, he determined to leave. He thought the door was just behind him; but he could not find the lock; and while he was feeling for this, and growing almost alarmed at the incident, his outstretched hand was clasped by another, and a voice cried: 'So we meet in No. 77, then, after all!'

He knew the voice; he had never heard it since the night he had accepted the ring—knew the figure of Zafiana, who was standing close to him.

This excited no surprise in Benedict, who now seemed to have been expecting to see him all along. His clasp was hot, while the atmosphere of the room seemed to grow hotter and hotter. 'I cannot stay to talk to you,' said the young man; 'I must go.'

'You must go! Ha, ha, ha!' Zafiana laughed in exactly the three syllables in which all such beings have laughed, in romance or on the stage, from time immemorial. Benedict had always thought this a ridiculous conventionality; but he now saw it was founded on fact, and doubtless

much experience. 'You must go?' repeated Zafana. 'Do you know that you are talking to your master?—Give me the ring!'

Without any action on the part of either, the ring flew from Benedict's hand, and at that moment the burning heat of the room became almost insufferable.

'You have broken your agreement,' pursued the seer, 'and must pay the forfeit.'

'What forfeit?' cried Benedict, growing desperate. 'I agreed to no forfeit, and I will have nothing more to do with you.'

'Ha, ha, ha!' laughed Zafana again. 'You have lost the ring. The coffers of gold and your splendid equipments have ere this wholly vanished. You will meet me to-morrow night at nine o'clock; then you will know the rest of the penalty.'

'I won't. I'll see you'—The rest of Benedict's speech was lost in another mocking laugh from the Chinese seer, who thrust his face close to his victim's; and his breath was so scorching, that, with a frantic effort, Benedict threw him off. As he did so, the room sank or melted away; and in an instant the old familiar lines of his lodging at Brixton became visible, and he found himself sitting in front of his fire, which had burnt up to such a size and fierceness that he was almost roasting.

He pushed back his chair, drew a long breath, and strove to collect his thoughts. He looked at his hand—the ring was gone! But then he remembered it had not been there when he sat down, and if he had been to sleep—But it could not have been all a dream! How long had he been under the spell? What day, or month, or year, was it?—Ah! There was his landlord coming in; he was on late duty, being a railway clerk.

Benedict bade him 'good-night,' and then, as calmly as he could, asked the date and the time. 'I am surprised you should have forgotten the date, sir,' returned his landlord cheerily from the hall: 'it is half-past eleven on the last night of the old year.'

'Thank you,' said Benedict.—'Then it is a dream,' he muttered; 'but if ever I go again to any of these manifestations, why, I will be content to have such another!'

In the morning he received a note from Bince, urging him not to forget that night at nine; a valuable medium had promised to come, a foreign gentleman, and he knew Benedict would be delighted to meet him.

'Shall I?' muttered Cloudesley, whose thoughts at once reverted to Zafana and his appointment for that night. 'None of your foreigners or mediums either, for me: I will go to the play.'

And go to the play he did. It was rather cowardly on his part to do so, perhaps; but, seated in the centre of a crowded pit, he felt he could defy any necromancer or seer. He went home in good spirits, having got over the dreaded hour.

The next day he saw his friend Bince, who was in ecstasies at the splendid results of the previous night, and particularly anxious to get Benedict to witness their repetition on an early occasion; but the latter said: 'My dear boy, you are a truthful fellow, so I will not dispute anything you say. I will admit you do see and hear all

these things, but I do not think I could; I am not the right sort of fellow: my mind is not exalted enough. In any case, I do not mean to go again, for I never had such a nightmare as I got from your spirits, and which was all I ever did get from them.'

Never again did Benedict Cloudesley go to a séance, and never again did the Chinese seer present his ominous features to his gaze or utter his mocking laugh in his ears.

THE MONTH:

SCIENCE AND ARTS.

THREE very interesting papers have lately been read before the Royal Geographical Society. The first to which we call attention is that by Mr D. W. Freshfield, the Hon. Secretary, on 'The Peaks, Passes, and Glaciers of the Caucasus.' Mr Freshfield is well qualified to speak upon this subject; for he was one of the early explorers of the alpine portion of this district, which he first visited more than twenty years back. Owing to faulty surveying, it has been stated, and is still stated in various text-books, that the glaciers of this region are few and unimportant; but this, Mr Freshfield shows, is not the case. The Caucasus differs from the Alps in having no lakes; while the scenery, if less picturesque, is far grander in character. The atmosphere is pure, and the whole country is clad with forests, which are brought up to the very verge of the snow and ice. Mr Freshfield maintains that while the Alps are played out for purposes of discovery, the Caucasus offers a fresh field for the climber, as well as for the naturalist, the ethnologist, and geologist. He traversed one peak which was considerably over sixteen thousand five hundred feet above the sea-level, and he speaks in glowing terms of the grand view presented to him from that eminence.

Another interesting paper has been read to the same Society by Mr John Stearns, who, two years ago, undertook at his own expense a journey of exploration through a corner of Brazil about which hitherto little has been known. This district is situated in the valley of the Rio Doce, and although it is within two hundred and fifty miles of the city of Rio de Janeiro, its natives are cannibals. They still wander about without clothing, and seem to be as little civilised as it is possible to imagine. They have no religion, and the only time that they seem to acknowledge a superior Power is when a thunderstorm bursts over them, when they throw fire into the air to appease the wrath of the Great Spirit. The reason why this district has not benefited by civilisation is, that settlers have passed it by; for the river already named is useless for navigation on account of its being intersected by falls and rapids; moreover, hitherto, tribes of fierce Indians have inhabited the dense forests by which the country is surrounded. It is probable that this neglected district may be opened up, now that this explorer has made known so much about it. Its chief product is rosewood, which we need hardly say is of great value.

The Ruby Mines of Burmah, about which we have heard so much since the British annexation

of that country, formed the subject of another most interesting paper by Mr Robert Gordon, who surveyed the ruby-mining district, lying north of Mandalay, shortly after the annexation took place. He tells us that the mines are of three different kinds. The first consist of workings in veins of soft material which are found in the hard rock, which veins are due probably to volcanic action in past ages. The second class of mining is by washing, and may be compared in a less degree to the hydraulic mining carried on in California and other places. In this case the clay is cut into a thin slice with an ordinary spade, and is then washed, so as to dissolve away the softer material, and leave any precious stones that may be encrusted within it. No attempt, however, has been made to employ water under pressure. The third class of mines may be regarded as the most important; these are found in the lower lands of the valleys, where, at a depth varying from ten to thirty feet, there is found a layer of corundum. The lecturer could not give any information as to the future of the Ruby Mines; but he said that with the careful handling which they were sure to receive under the new governors of the country, their mineral wealth could soon be rapidly developed.

A German newspaper publishes a letter from a correspondent at Dresden which tells of alleged frauds at the noble Gallery of Paintings in that city. It is stated that of the several pictures recently purchased at high prices, some are mere copies, others are works of inferior artists, while some are simply forgeries. Sixteen years ago, the authorities, out of their share of the French war indemnity, were able to purchase eighteen pictures said to be by old masters. It is these pictures which have lately been condemned. At the time they were purchased, it was stated by those who professed to know that the pictures were not worth the money asked for them, and that the reputation of the alleged artists appeared to be the standard that regulated the price instead of the artistic value of their works. This lesson comes home to us in Britain, where an altogether fancy value is often attached to the name of a painter regardless of the work which he produces.

Dr Schliemann, whose reputation as a discoverer is already widely known, has commenced excavations at Ramleh, a place, it will be remembered, which was last brought into prominence by the events which followed the bombardment of Alexandria, a few years back. These excavations are in order to discover if possible the remains of the Palace of Cleopatra. The work has been continued to a depth of about fifty feet; but its progress has been much hindered by local springs. Some stonework has already been discovered which is believed to belong to the building sought for.

We have already alluded to the circumstance that M. Pasteur has proposed to exterminate the rabbits at the antipodes by the introduction among them of the epidemic known as hen-cholera. In the letter addressed by him to the Agents-general of Australia and New Zealand, he not only fully explains his method, but he gives particulars of a remarkable experiment which at once shows its efficacy. Madame Pommery, the well-known champagne grower, had unfortunately been induced to breed wild rabbits in an enclosed vine-

yard of twenty acres. In a short time they increased to the extent of a veritable pest, and threatened destruction to the adjacent wine-vaults by their continual burrowing. In her distress the owner applied to M. Pasteur, who sent one of his pupils to the place armed with some recent 'culture' of the microbe of fowl-cholera. This was mingled with some food spread for the rabbits, and was quickly consumed. On the following day, all the rabbits were dead, mostly dying in their burrows. This mode of death, unlike that by poison or trap-methods, which have been largely adopted by the Australian colonists, is said to be quite painless. The animal affected wraps itself up in a ball and dies, 'to all appearance in a painless sleep.'

A resident at Herne Bay was lately walking along the beach near that place when he noticed a somewhat remarkable projection from a stratum of clay in the cliff. He at once saw that it was the fossilised remains of some animal, and with assistance removed it. It was found to be a tusk of the hairy northern elephant, which measured fifty-seven inches in length, with a circumference of seventeen inches at its thicker end.

The advent of a new musical instrument, especially if it promises to be of real use, is always an interesting event. Such an instrument has lately been invented by M. Dietz of Brussels; it is called the Claviharp, and, as the name suggests, it consists of a harp furnished with a *clavier*, or keyboard. The strings are of metal, furnished with an insulating covering, so as to give the tone of catgut strings, but without their liability to be affected by changes of atmosphere. But the most important feature of the Claviharp, and one in which it differs from all other keyboard instruments, is, that its strings are not struck by hammers, but are *plucked* as by the fingers of a harpist. Skilled harpists are so few in number, and modern orchestration so often requires their presence, that a great difficulty is often experienced in filling their places. The Claviharp is intended to fill this gap, and there is little doubt that it will do so, more especially as it can be played by any one accustomed to the pianoforte. At a concert in London recently, the capabilities of the new instrument were effectually demonstrated.

In a German botanical journal, a new method of retaining the natural colours of flowers when put under pressure for preservation has recently been published; it consists of dusting salicylic acid upon the leaves, and removing the powder with a brush when the petals are dry. Or the same acid may be used as a solution, one part of acid to fourteen of alcohol. Cotton-wool or blotting-paper impregnated with the solution is laid above and beneath the flowers as they lie in the press. It is said that red colours in particular are well preserved by this simple process.

The administration of ammonia and other alkalies as a remedy for the stings and bites of venomous insects has long been known, the theory of the treatment being the neutralisation of the acid poison. And as surely as autumn comes round, ammonia, soda, &c. are pointed to as convenient aids to the cure of wasp-stings. It is so seldom, however, that an authentic case of cure of snake-bite by such simple means comes to hand, that the details of such a case, published in the *Indian Medical Gazette*, cannot fail to be of

interest. The sufferer was bitten in the hand by a small cobra, and the usual symptoms—inability to stand, gasping for breath—quickly set in. At the same time the hand and arm were much swollen. Permanganate of potash in powder was rubbed into the wound, and hypodermic injections of ammonia diluted with water were administered at frequent intervals. The patient was also given draughts containing ammonia. Although apparently brought almost to the point of death, the man gradually took a turn for the better, and eventually recovered.

Although we have occasionally to deplore instances of individual bigotry or intolerance, we must all admit that the sure march of education has had the effect of eradicating these faults from civilised nations to a very great extent. An instance of improvement in this respect is afforded by the recent decision of the Italian government to issue a new edition of the works of Galileo at the expense of the state. We may remember that it was less than three hundred years ago that poor persecuted Galileo was forced by the authorities to do penance for publishing his opinions, and was made to declare that to be false which he well knew to be true. The works will be published in about twenty-five volumes, under the auspices of the university of Padua, and copies will be presented gratis to the chief public libraries of the world. A better monument to the first man who turned a telescope towards the heavens could hardly be imagined.

The great interest which has of late years been developed in the art of photography, mainly on account of the ease with which modern methods can be practised by amateur workers, is evidenced by the number of important Exhibitions which have taken place since the commencement of the year. Of these we may mention those at Nottingham, Gloucester, Dundee, Liverpool, and the most important of all, that at the Crystal Palace, Sydenham. This last has been so successful in every way, that it will probably be repeated next year upon a still larger scale. In addition to these Exhibitions, there has been an important Conference of photographers in London, and a Photographic Convention with its headquarters at Birmingham is to meet in a few months' time.

Some account of the poisonous properties of the yew have lately been published, from which it would appear that the poisonous qualities of the tree are confined to the leaves. A very small quantity is fatal to the horse, the ass, and the mule; but it requires a far larger amount in proportion to the size of the animal to kill the goat. These observations may be new to many, but we may remind our readers that Gilbert White, of Selborne fame, was well acquainted with the poisonous nature of the tree, and gives several particulars concerning its action upon cattle.

A new form of Letter-copying Book has been recently introduced, in which the use of water and brush is dispensed with. The leaves of the book are so chemically prepared that they remain in a damp condition until after they have received the impression from the documents to be copied, when the moisture disappears on the application of blotting-paper. The importance of retaining copies of letters is known to all men of business; and probably more will avail themselves of that method of registering their transactions, when

they know that by this new plan the trouble of doing so is reduced to a minimum.

Mr Robert Irvine, Caroline Park Works, Edinburgh, has recently published, in pamphlet form, a paper which he read a short time ago before the Society of Chemical Industry. This paper takes the form of 'A Note on the Action of Bleaching Agents upon Writing-ink as a Means of detecting Fraud.' Mr Irvine has found that the age of written characters can be gauged to some extent by the action of a dilute solution of bleaching-powder, commonly known as chloride of lime, upon them. The newer the writing, the more quickly will it disappear. This discovery will be of obvious use in suspected cases of alteration of old documents, for interpolations can by it be made conclusively evident. The pamphlet in question gives particulars of the method, as well as details of other experiments in the same useful direction.

While different methods of dealing with that difficult problem, the disposal of the sewage of large towns, are constantly brought before the public, the sewers themselves give their own testimony, in the shape of evil-smelling and disease-bearing gases, that the present method of drainage is fraught with perils to health. Through every street-grating noxious effluvia are expelled, and nothing is done to remedy the evil. Keeting's Sewer-gas Exhauster and Destructor is a simple appliance for both ventilating these unsavoury water-ways and for rendering the gases extracted from them innocuous. It consists of an upright pipe connected with the sewer, which for convenience can be crowned with an ordinary street lamp. Within this pipe is a special form of gas-burner, capable of raising its metallic surroundings to an intense heat. This burner in the first case raises such a draught that the gases from the sewer below are drawn into the pipe, and the heat from it then decomposes those gases into harmless products. Careful experiments have shown that the apparatus will do what is claimed for it at an expenditure of six cubic feet of coal-gas per hour, and that a single burner will effectually ventilate the sewers for a radius of about two thousand feet. The cost of maintaining the system can thus be roughly estimated, but we have no information as to the expense of the original plant.

Mr Brode of Glasgow has patented a method of utilising coal-dust, or slack, which is said to afford a convenient and efficient form of fuel. He mixes the dust with an adhesive solution made of water, ground-rice waste, and silicate of soda. The mass is well incorporated in a mixing-machine, and is then moulded into blocks. It is curious to note that fuel in block-form, although it has been in use for a great many years on shipboard, has only very lately been employed in the domestic fire-grate.

Mr Wigham, who is so well known as an authority on lighthouse illuminants, recently delivered a lecture on that subject to the Belfast Natural History and Philosophical Society. He was able to point to more than one lighthouse in Ireland where his gas system has been adopted with success. He pointed out how gas could be made to give as intense a light as electricity, with the advantage of possessing that predominance of red and yellow rays which are of such service in penetrating fog. In the course of his lecture, he

described several improvements which he had devised, including a method of doing away with chimneys round the burners. The plan consists in supplying under pressure a cylinder of air, which encircles the flame and acts as a chimney to it.

Captain Doty, who has for some years been noted for the invention of one of the best lamps for burning mineral oil, has lately produced a Gas-flame Lamp, or retort-burner light, which is likely to prove of great service to builders, railway contractors, and others, who require to illuminate large open spaces for temporary purposes. The apparatus consists of a tank to contain the oil, at the top of which is a special form of burner for vaporising it. This consists of a coil of pipe through which the oil flows, which coil terminates in a jet which is carried to its base. An air-pump forms part of the apparatus by which an initial pressure is put upon the liquid in the tank. In starting the lamp, a little tow saturated in oil is ignited within the coil, when the metal speedily becomes heated, and the oil within issues as gas. From this moment, the lamp is self-acting, the flame itself giving the necessary heat to the coil which surrounds it. The consumption of three-quarters of a gallon of oil per hour is said to give a flame of five hundred candle-power. The lamp is quite portable, and in this feature lies its great value.

A correspondent of the *Chicago Herald* has recently published some interesting particulars of his journeyings to the Asiatic empires, where he had gone some time back for the purpose of introducing the electric light. He found that his mission was warmly espoused by the Japanese, and says that their principal cities are now lighted by electricity. The palace of the Mikado at Tokio is similarly lighted. The Chinese did not seem so ready to avail themselves of the latest advances in science, and his success with them was therefore not so pronounced. The Koreans, on the other hand, were eager to believe in anything born of the United States, and welcomed the new light. The king's palace was illuminated for the first time with three hundred lights on the occasion of the birthday of his mother-in-law, a festival not generally so much honoured in more civilised communities. But the workmen ran an uncomfortable risk in placing the wires, for, by the law of the country, no foreigner may look upon the features of the king and queen without suffering death. For this reason, they were carried to and from their labours in palanquins, while trumpeters were sent before them to warn any loitering members of the royal family to get out of the way.

In an article contributed to the *Provincial Medical Journal* by Dr Harley, F.R.S., the practice of moderate drinking and its influence upon health is dealt with in a masterly manner. The writer points out that moderate drinkers may be divided into two classes—namely, those who partake of stimulating beverages only at meal-times, and those who indulge in 'nipping' without at the same time partaking of food. He shows the danger of the latter habit in inducing liver and other organic complaints, by abstracting from the Registrar-general's Reports the death-rate from such diseases—for those engaged in such occupations—commercial travellers, brewers, inn-

keepers, barmen, waiters, and others—as are likely to lead to a temptation to take frequent 'glasses.' He then compares the result with the death-rate of gardeners, printers, farmers, drapers, and warehousemen, who are kept away from such temptation. The difference between the figures is startling and most suggestive.

Two hundred and twenty-five pounds sterling for an egg-shell seems to be rather an extravagant price. Yet that sum was paid only the other day for an egg of the Great Auk. There is nothing beautiful about the egg, nor is carbonate of lime, of which it is composed, of any intrinsic value. But the Great Auk happens to be extinct, and only sixty-seven shells are known to exist. Mr Stevens, the well-known London auctioneer, through whom the egg was sold, has informed us that the purchaser was a dealer. The inference, therefore, is that the buyer expects to get a still larger sum for his investment. And he is likely to do so, for when the collecting craze attacks a human being, he thinks not of price so long as he can claim possession of the coveted thing.

Canon Bagot and others, both by voice and pen, have shown how the dairy interests of England and Ireland may be advanced by attending to many small details now neglected, and how a higher price may be secured for butter more scientifically prepared. In this connection we mention what is called a 'Baby Separator,' by the use of which twenty per cent. more butter can be manufactured from milk than from an equal quantity separated by one of the old systems of setting. It was exhibited for the first time in England at the London Dairy Show, where it was awarded the Lord Mayor's Champion Cup. Its price is £12, 10s., and its skimming capacity is twelve gallons per hour. It is made to be fixed on a firm table or stand, and may be turned by a young person, while the separation is as perfect as that of the larger machines. The larger Laval separators, as now made, are adapted to the requirements and the pecuniary resources of every user. The farmer or dairyman who has steam, gas, water, or horse-power available, has two machines, of different prices and capacities, to choose from; those who possess a steam-boiler, but find the use of an engine and gearing impracticable or inconvenient, have their wants supplied by the new steam turbine separator, which for motive-power requires nothing more than a small jet of steam; and those who have manual power only can take their pick from three hand machines. The agents in this country for Dr Laval's 'Baby Separator' are the Dairy Supply Co., Limited, Museum Street, London.

We note in this connection that the recent Report of the Departmental Commission finds that there is a great loss to the country through its want of knowledge of the most effective modes of dairy practice, and that to supply this want state aid is necessary. They suggest the creation of a new system of agricultural education, to be gradually carried out, beginning by meeting the most pressing wants, and by engrafting practical agricultural teaching on a limited number of existing schools, and to proceed on a well-matured system, capable of future growth and extension. The Commission is strongly of opinion that increased facilities should be given to agricultural

instruction in rural elementary schools; that a limited number of scholarships for boys and girls should be instituted; and that further inducements should be offered to teachers to improve their qualifications for giving instruction in agriculture.

THE NEW EL DORADO.

WITHIN the last two years two new towns have sprung into existence with a rapidity that is marvellous, considering the difficulties in the way of transport of the necessary materials for building purposes. Unlike the majority of towns of rapid growth of which one has often read, these two are not of American origin, but are situated in the Transvaal Free State, in South Africa. The older of the two is named Barberton, and is situated about three hundred miles to the east of Pretoria, the capital of the Transvaal; while the younger, Johannesburg, lies between thirty and forty miles south-west of the same place. Both owe their rapid rise to the discoveries of gold which have been made in their immediate neighbourhood.

The place where Barberton now stands was, two years ago, occupied only by a few miners and prospectors, who had discovered rich gold-bearing reefs after long search. The news of the 'finds' soon became known throughout the whole of the South African colonies, and a steady stream of eager miners, speculators, and others, set in. The most popular way of reaching the new El Dorado from the Cape Colony was by way of Kimberley, the terminus of the Cape Government Railway, and thence by mule-wagon, a journey of some hundreds of miles, costing in the early days from twenty to thirty pounds.

Rich discoveries of gold continued to be made, and Companies were floated in rapid succession. Buildings of the roughest materials were erected, and were eagerly competed for, while large numbers of persons had to put up with the accommodation afforded by tents. Transport-riders were, however, soon busily engaged in bringing up the necessary materials for building purposes, the cost of carriage from Kimberley ranging from fifteen to twenty-five shillings per one hundred pounds. The town rapidly grew, and is now a handsome one, containing many buildings of brick and stone; while wood and corrugated iron have entered largely into the composition of most of the smaller dwellings. The population at the end of last year was about eight thousand.

Some months back Barberton passed through a rather severe crisis; for a time there was but very little work done on many of the reefs, nearly every one being busily engaged in dealing in the shares of the various Companies, which rose by leaps and bounds to many times their original value. This state of things could not, of course, go on for ever, and prices of stock began to fall with the same rapidity as they had risen. For a time it looked as though the days of Barberton were numbered. Many persons left for other places. However, machinery began to arrive from England; hard work was commenced in earnest, and gold is now being obtained in quantities which are steadily increasing every month.

While all South Africa was talking of Barberton, prospectors had been busily engaged searching for gold in other places; and about the end of 1886 rumours of rich discoveries at what is now

Johannesberg began to be noised abroad. Numbers of persons made their way thither, and the town began to spring up. Luckily, however, before building had proceeded to any great extent, it was discovered that the main gold-bearing reef ran right through the heart of the site which had been marked out for the new town. Building on such valuable ground was at once suspended, and a new situation fixed upon some few hundred yards away. Johannesburg grew rapidly; and the population is now estimated at about eight thousand, which, for a place that, with the exception of a few shanties and tents, was practically non-existent little over twelve months ago, is really marvellous. The cost of living at Johannesburg is high, butter fetching three shillings per pound, cabbages two shillings each, eggs one pound per one hundred, potatoes thirty-one shillings, and onions twenty-five shillings, per bag, and other articles in proportion. Fodder is also expensive, green barley fetching twenty shillings, and oat-hay thirty shillings, per one hundred pounds.

The output of gold from South Africa for the year 1887 was nearly a quarter of a million; and considering the short time that most of the Companies have been at work, this may be looked upon as satisfactory. The yield for the present year will, it is estimated, reach one million pounds, but many talk of double that quantity.

In conclusion, it may be as well to point out to persons who contemplate rushing off to these newly-discovered fields, that alluvial gold in payable quantities has not yet been discovered. Any one, however, with a practical knowledge of gold-mining machinery and assaying who is prepared to rough it for a time, might do worse than take his passage for the new southern El Dorado.

THE WORLD.

A PLAYGROUND—oft with clouded skies,

That o'er the rosebuds weep,

Where little troubles take the weight

Of sorrows far more deep;

Where loved toys break in tiny hands—

Sad symbols of the time

When hope shall cheat, and joys depart

In Life's swift-passing prime.

A BATTLEFIELD where forces meet,

And unseen hosts contend,

With truces all so short, they seem

With the wild strife to blend:

Strife that leaves none of us unscathed,

Where'er the mastery be;

But who, till the Great Day, can tell

With whom is victory?

A GRAVEYARD, where on every side

Pale monuments arise,

To show how brief is human life,

How vain is all we prize.

A Graveyard filled by memory,

Where phantoms lightly tread,

But each one points with finger raised

To blue skies overhead.

CAMILLA CROSLAND.

In Memoriam

ROBERT CHAMBERS

BORN 1832. DIED 1888.

It is but five years since we had the melancholy duty of recording in these pages the death of the founder of this *Journal*, Dr William Chambers. To the list of the departed must now be added that of the *Journal's* latest conductor, Mr ROBERT CHAMBERS.

Mr CHAMBERS, who was the eldest son of the late Dr Robert Chambers, had been associated with the work of the firm—of which he was finally the head—for a period of thirty-four years. In all departments of the firm's business he took a keen and intelligent interest; but from 1873, when he and the late Dr William Chambers assumed between them the management of *Chambers's Journal*, his work for many years lay chiefly in this department, with the result of a great and continuous success. Mr Charles E. S. Chambers now succeeds to his father's place in the business of W. & R. CHAMBERS, as conductor of the *Journal*, and head of the firm's various literary enterprises.

The memory of the late ROBERT CHAMBERS will long be cherished by those who were associated with him in the work of the firm, his unvarying courtesy and kindness of heart being manifested uniformly to all who came in contact with him. Of his goodness and generosity to contributors and others, only those who worked with him can know; for he himself conferred his favours without ostentation or publicity, always accompanied by a few kindly words that made the gift the sweeter to the recipient.

In literary matters, Mr CHAMBERS possessed a quick and sound judgment, having something approaching to an instinct for the kind of literature required. Until within the last two years he constantly identified himself with all the work of the firm—encyclopædic, educational, and artistic; but since then the state of his health had rendered rest and quiet necessary for him. He passed away at his residence in Edinburgh on the evening of Friday, 23d March.

SATURDAY, MAY 5, 1888.

PRICE 1½d.

DOWN GOYDEN POT.

AN article appeared in *Chambers's Journal* for October 18, 1886, entitled 'Cave-hunting in Yorkshire,' where reference was made to a series of caverns and subterranean watercourses which honeycomb the limestone hills at the head of Nidderdale, and especially to a curious natural tunnel in which the river Nidd flows for nearly three miles, known as Goyden Pot. No one has ever succeeded in following the stream from where it disappears under Beggarmote Scaur to the point at which it appears again from out of the hillside just under the Vicarage below Lofthouse; at least there is no record of such a feat, though tradition tells of a duck which once made the passage, but with the loss of all its feathers.

Thrice have two of us explored this awesome aqueduct of nature's engineering, but each time with comrades less enthusiastic in cavern-work than ourselves, whose ardour cooled after experiencing the pleasures of scaling rocky points in semi-darkness, and wading deep in rushing water, with numbed feet, against which sharp pebbles roll. And so, when we determined to celebrate the year of Her Majesty's Jubilee by a resolute attempt to penetrate to the farthest possible point in this famous and weird Pot, we decided to do it alone, unhampered by companions of any sort. Therefore did we betake ourselves to the little village of Lofthouse, which stands towards the head of Nidderdale (or Netherdale as old authorities have it), some seven miles above the quaint market town of Pateley Bridge, and there, in its one inn parlour, gird ourselves for our task.

'We' were—the 'Captain,' a stalwart officer in the local rifle corps, a dalesman born and bred—and the 'Skipper,' a roving member of the Royal Canoe Club, who follows his Captain, 'Rob Roy' Macgregor, in a fondness for adventures underground.

'Well! ye be noän pretty, but ye lewks loike wark,' is the greeting of the buxom hostess of the *King's Arms* as we descend into the stone-flagged kitchen, which has just been 'weshed,' and is now

receiving the finishing touches at the hands of an artistic if snub-nosed maiden, who is marking it over with bold flourishes and strange winding devices in red ochre. And we mean work too; and so, having donned rough canvas trousers, blouses, and miners' hats, with candles galore and stout rope, march forth.

Clear of the village, our path runs down to, and crosses a rocky gorge by a footbridge, whose rough parapets are covered with soft velvety moss, and then turns off to the right, through fields skirting a long reach, where the rivulet is sunning itself before diving under the bridge. A lovelier walk than the one before us it would indeed be hard to find. A soft westerly wind whispers in the pine copses which stud the hillside to right, and sends the shadows sailing up the slopes to left, until, like ships reaching the open sea, they disappear westward over the great lone moors, where the heather and the ling shimmer in the heat, and the plaintive plovers call 'peewhit.' The fresh luscious grass springs at every step, in which the cattle feed knee-deep, lashing their tails amongst the buzzing flies, seeking the shade of the rough limestone walls which divide the meadows, and through which the pathway leads by the narrowest of stiles. And then the glories of the streamlet itself, whose sweet music, never dying, alternately grows softer and then more loud as it chatters over ridges of white pebbles, or slides past a face of rock which dips into its cool depths; whilst now and again the symphony is broken by noisy plunging, as its waters leap in glittering cascades down tiny fern-fringed cliffs, or rush sobbing over mossy shoots into deep pools and foam-flecked reaches. Water-ousels dip and twitter, and swallows circle round and round; and suddenly a gorgeous kingfisher darts out, his blue and scarlet plumage gleaming like a tiny rainbow, as we reach Limley, a lonely little farmstead, surrounded by stone walls on three sides, and by the stream, or 'beck' as the local term is, on the fourth. A great barking answers the click of the gate as we enter the foldyard, and a couple of sheep-dogs dash furiously at us.

'Come hoäm, wilt'a, Lassie; doon wi' ye, Bob, ye senseless barns!' screams a comely wench, coming to the door; then recognising the Captain, adds: 'Coom in' wi' ye; t'maister's sledding t' hay.'

Declining the proffered hospitality, we pass the end of the house and cross the now almost dry bed of the stream by a line of 'hippen-steäns,' just below the spot where an iron spring flows in, staining the stones a rusty red. A hundred yards farther we turn a corner, and there, right in front, is a quarry-like cliff, pierced by an arched opening a few feet below the surface of the ground, which falls away like a deep rockbound basin. This is the main entrance to the famous Goyden Pot.

Except in very wet weather, this opening is always dry, for the stream sinks into the hillside at a spot a quarter of a mile higher up the valley, called Manchester Hole. But after heavy rains, the swollen river cannot all get away there, and then it comes down, and leaps as of yore over this basin-lip straight into the Pot, making a pretty fall before it is lost in the dark passage within. When the 'floods are out,' the scene is completely changed, and even this capacious mouth cannot swallow the torrent, which rages and dashes its muddy waters down, filling completely, and often overflowing, its ancient above-ground course; and then, a grim swirling at this cliff-face alone marks where a portion of the Nidd is being sucked into Goyden Pot, to choke its caverns roof-full. A cold air blows steadily up from the dark distance as we enter the cave, and a thin mist clings to its damp sides, where the gleam from the daylight catches it. Boots are replaced by canvas wading-shoes, two candles lighted for service, and the remainder pocketed as reserve store, and then, with a last look at the bright world outside, we commence the descent. A muffled roar fills the wild cavern like a longdrawn groan; and as we clamber onward and hear the noise grow louder, we realise somewhat the old Norse Sagaman's story of the descent of Baldur into the realms of Hela.

For the first couple of hundred yards, the passage is roomy, and the rough boulders present little obstacle to an experienced cave-hunter, and ladies even can without difficulty follow it, until a sudden turn opens into a great chamber, and the path drops abruptly into a seemingly bottomless abyss, in which a stream of water is falling somewhere in unseen space. But we are bent on more than merely gazing into this black vault, so make for a hollow half filled up with rubbish, leading into another passage which winds along to the opposite side of the 'Great Chamber,' and ends in another sheer descent into darkness. Here the rope is fixed to a jutting point, and the Skipper disappears into the black gulf, and is within sight of the bottom, faintly discernible in the flickering light of his waving candle, when his hands, slippery with tallow, suddenly lose hold of the line, and next instant he is embracing, not his mother-earth, but the putrid carcases of two defunct sheep which have lain a long time in this odoriferous corner. Another moment, and the Captain comes down with a run, and a mighty 'Ugh!' as he finds his feet. Together, we scramble up and flee the scene, and with all

speed light up our trusty pipes; and as we puff great clouds of fragrant 'honeydew' into each other's faces, we bless the memory of brave Sir Walter Raleigh, and vow we will eschew (braxy) mutton in the future. At one end of this chamber there is a fine cascade, where the water from Manchester Hole comes leaping down some thirty feet or more; and though the dry weather has lessened its volume, yet we get a good douche-bath as we pass behind it. Foaming its way over the rock-strewn floor, the river crosses the cavern, and then plunges down a long lofty passage. Upon a subsequent visit, a few weeks later, a less perpendicular descent was discovered at the extreme end of this Great Chamber; and 'two bonnie maidens frae over the Border' actually accompanied us to the edge of the rushing water. Scrambling gallantly over the rough rocks with tallow-bespattering candles in hand, and fearlessly dropping into black abysses, their ready pluck quite won our hearts, but, alas, woefully damaged their gowns and gear. Stepping into the stream, we follow it down many a swirling run and over rocky steps, wondering to find how warm its waters, knee-deep, are.

A loud shout makes the Skipper turn hastily to where the Captain's stalwart figure is clinging to a glistening rock over which the Nidd leaps in a white curve, whilst he points frantically in the dim light to the pool below. The packet of candles has fallen from his pocket, and six composites are tossing in the rush of waters! Desperately do we grab at three, and save them; but the others elude our eager grasp, and voyage onward, perhaps to float out with the freed river and dance down the Dale; perhaps condemned to slowly dissolve in some sullen deep, or to catch in some ever-dark cranny—but never now, alas, to light us on our way, either in advance or retreat; therefore, it behoves us to husband our remaining stock, for a struggle back up this winding water-fretted channel in pitch darkness would be no joke. It is wonderful what ghostly objects seem to loom out of the gloom as the candle-rays are thrown around, and how fancy makes ghastly corpses of the strangely worn stones which lie about at every bend and turn; gnomish eyes glare fiercely out of deep corners, and sobs and moans seem to fill this weird solitude with painful life; and our own voices rouse unearthly echoes, and sound unnatural in the awful darkness.

But we are too eager to get on to let such uncanny thoughts have play, and bend after bend is turned and left behind. And now the passage widens, but unfortunately grows lower and lower, and in a few moments heads are stooped, and then shoulders. 'It will get higher in a few yards,' foretells the sanguine one; but, alas, like many a Weather-Forecast, the prognostication comes not true, for already we are bent double, and the roof is still descending upon us. It is no good shirking it; if we are to follow the stream farther, we must crawl! So, down we get on to all-fours, or rather all-threes, for one hand is wanted to hold the candle, and splash on for ten yards, and then the Skipper sinks level with the stream, and turning on his side, wriggles ahead; the Captain following suit, lets his light dip under water, necessitating a halt and a backward wriggling until the leader's candle can be reached over his shoulder.

Progress is now very slow, for we are constantly getting wedged fast between the roof and the floor; but we push on somehow, crawling along in the very stream itself, with the water running merrily over us, and constantly putting out our lights in turn with a mischievous splash. Twenty yards more of this amphibious advance, and we stop.

We are really beaten at last, and cannot get a foot farther, for the roof and the water meet, where a big gravel-bed chokes up the whole passage, into which the stream sinks; for a very thin sheet of it only can find its way over the bank. It is certainly very disappointing to be thus stopped; but we have at least proved that much spade-work is necessary before any human being can pass this block, and we have got to the farthest point we possibly can at present in Goyden Pot. So we toast our Sovereign Lady Victoria in whiskied water, and there lying picturesquely in mid-stream, we lift up our voices and sing *God save the Queen*.

The retreat is decidedly more uncomfortable than the advance, for, crawling up stream, the water meets our resisting, pushing bodies, and foams gleefully over shoulders and down necks. At last we reach higher regions. The luxury of standing upright again is something indescribable, and quite unrealisable by those who have never spent an hour imitating the movements of a serpent or an eel. We are to have some reward for our venture after all, for in passing a rocky cliff, we espy a ledge, and beyond, a black band, which betokens another passage; and scrambling up some twelve feet, we find a low opening, nearly filled with soft mud. Sliding over it, we are in a winding cavern which turns away to the southward, gradually rising foot by foot. Following this for some distance, we catch the sound of trickling water, and come suddenly into a most curious place. To the right, the cavern rises; and clambering over a great heap of branches, stones, and flood-debris, we are at the bottom of an almost circular shaft, which goes sheer up like a huge chimney, and down whose sides water is running and sparkling in the feeble rays from our candles. This is evidently a capacious rain-spout, where, in wet weather, the water plunges from the upper ground; and though no glimmer of daylight is visible, yet it shows unmistakably that 'swallow' and 'pot' holes are formed by the surface of the land above falling in. At the bottom, this shoot turns like a corkscrew through an archway, and our lights are reflected under it, like two stars, in a black-looking pool some distance below us. Slipping down over a slimy slant of rock, we see a cavern, lofty but narrow, without any floor but the water. An old rail-post, washed hither by some flood, is lying against the little cape on which we are perched; and by its aid the depth is found to be a yard at the edge, so down into the pool the Skipper drops. 'O Jupiter, it's cold!' Unlike the main stream, warmed by days of hot sun before it leapt into Goyden, this water must have been here long months, for a moment's examination shows that there is no current, and that in fact this is a small subterranean lake. Wading on waist-deep, a point of wall is reached; and beyond, the cavern opens out, and hangs, a

great vaulted dome, over the turgid pool, which suddenly deepens till the rail will not bottom.

Are we to swim across or not? is the question earnestly debated, and finally negatived, not by ourselves, but by want of candles. We have only one spare one—just enough to ensure our return to the outer world—and no matches (the water-crawl having effectually spoilt our supply), with which to relight, if by chance we should dip our lights under when swimming. So we scramble up out of the frigid bath, and ruefully take a last look at the mysterious pond. In all probability, this is one of many chambers of Goyden Pot, and its only outlet is the passage we went up. In floods it fills, and then the waters rise, and overflowing, rush down the passage to join the main stream in the Pot; whilst, when the season is dry, there is only a deep pool in the hollow. Of course, it is possible that there is an outlet at the farther end, like the opening we entered it by, though the utter absence of any current seems to render this improbable. But this point will be thoroughly investigated in our next venture.

Once more in the Great Chamber, we explore it carefully, in hopes of finding some way up to a tunnel which comes into it on the north side, a yard from the roof; but our search is fruitless; so, resolving to bring a light ladder some future day—though how to get it down the winding passage will be a puzzle—we make for the rope, which hangs like a white streak against the black rocks, and hand over hand go up, and stand once more at the end of the gallery, and leaving a candle-end burning at the place of descent, steer for the upper main cavern. For some moments we cannot find the way out, so filled up with gravel is it; and we begin to half fancy we must have made a mistake and taken the wrong turn; but a second careful search shows the opening, and we speedily scramble through, and then turn down for the head of the cascade.

Here we find a new state of affairs, for, instead of boldly springing over the edge of the precipice, the water has forced its way through the floor, leaving a bank across the line of its old leap. On examination, this is found to consist of shingle, held in position by a great tree, which some flood has carried down and wedged like a dam across the channel, to catch and hold everything which the stream washes against it; and the water itself, headed back by it, has made a way down a fissure in the limestone.

The sun is sinking in a purple sea of cloud as we come out into daylight, and the scent of new-mown hay is wafted on the rising breeze as we climb the bank of the dry channel and set out in the hazy evening, homeward-bound.

Thus a fourth attempt to get through Goyden has failed, and the question we now discuss is, can it ever be done? The results of this last venture are, it must be owned, rather discouraging. Evidently there is a large deposit of gravel spread over a considerable distance, which every 'fresh' adds to; and when we come to think that no flood-debris of any moment is washed out at the lower openings below Lofthouse, and that there are no bars or shingle-beds formed near these outlets, we are led to fear that for a long length somewhere the subterranean passage is

pretty effectually blocked. Perhaps it is even silting up; and a succession of heavy floods may in coming years so choke the channel that the Nidd, instead of diving out of sight for nearly three miles, will once more roll its brown waters along its ancient bed in the open day between ash-fringed banks and limestone scaurs. Be this as it may, it will take more than another exploration to satisfy us that the passage of Goyden Pot is impracticable; and until the new-found subterranean lakelet is proved to have no second outlet, we still cherish the hope of being able to follow the river Nidd throughout its three miles of hidden passage.

THIS MORTAL COIL.

By GRANT ALLEN, AUTHOR OF 'IN ALL SHADES,' ETC.

CHAPTER XX.—EVENTS MARCH.

'PAPA is still in Scotland,' Winifred wrote to Hugh, 'slaying many grouse; and mamma and I have the place all to ourselves now, so we're really having a lovely time, enjoying our holiday *immensely* (though you're not here), taking down everything, and washing and polishing, and rearranging things again, and playing havoc with the household gods generally. We expect papa back on Friday. His birds have preceded him. I do hope he remembered to send you a brace or two. I gave him your town address before he left, with *very* special directions to let you have some; but, you know, men always forget everything. As soon as he comes home, he'll make us take our alterations all down again, which will be a horrid nuisance, for the drawing-room *does* look so perfectly lovely. We've done it up exactly as you recommended, with the sage green plush for the old mantel-piece, and a red Japanese table in the dark corner; and I really think, now I see the effect, your taste's simply exquisite. But then, you know, what else can you expect from a distinguished poet! You always do everything beautifully—and I think you're a darling.'

At any other time this naive girlish appreciation of his decorative talents would have pleased and flattered Hugh's susceptible soul; for, being a man, he was of course vain; and he loved a pretty girl's approbation dearly. But just at that moment he had no stomach for praise, even though it came from Sir Hubert Stanley; and whatever faint rising flush of pleasure he might possibly have felt at his little fiancée's ecstatic admiration was all crushed down again into the gall of bitterness by the sickening refrain of her repeated postscripts: 'No further news yet from poor Elsie.—Has she written to you? I shall be simply *frantic* if I don't hear from her soon. She can *never* mean to leave us all in doubt like this. I'm going to advertise to-morrow in the London papers. If only she knew the state of mind she was plunging me into, I'm sure she'd write and relieve my suspense, which is just *agonising*.—A kiss from your little one: in the corner here. Be sure you kiss it where I've put the cross. Good-night, darling Hugh.—Yours ever, WINIFRED.'

Hugh flung the letter down on the floor of his chambers in an agony of horror. Was his crime to pursue him thus through a whole lifetime? Was he always to hear surmises, conjectures, speculations, doubts as to what on earth had

become of Elsie? Was he never to be free for a single second from the shadow of that awful pursuing episode? Was Winifred, when she became his wedded wife, to torture and rack him for years together with questions and hesitations about the poor dead child who lay, as he firmly and unreservedly believed, in her nameless grave by the lighthouse at Orfordness?—There was only one possible way out of it—a way that Hugh shrank from almost as much as he shrank from the terror and shame of exposure. It was ghastly: it was gruesome: it was past endurance; but it was the one solitary way of safety. He must write a letter from time to time, in Elsie's handwriting, addressed to Winifred, giving a fictitious account of Elsie's doings in an imaginary home, away over somewhere in America or the antipodes. He must invent a new life and a new life-history, under the Southern Cross, for poor dead Elsie: he must keep her alive like a character in a novel, and spin her fresh surroundings from his own brain, in some little-known and inaccessible quarter of the universe.

But then, what a slavery, what a drudgery, what a perpetual torture! His soul shrank from the hideous continued deceit. To have perpetrated that one old fatal forgery, in the first fresh flush of terror and remorse, was not perhaps quite so wicked, quite so horrible, quite so soul-destroying as this new departure. He had then at least the poor lame excuse of a pressing emergency; and it was once only. But to live a life of consistent lying—to go on fathering a perennial fraud—to forge pretended letters from mail to mail—to invent a long tissue of successful falsehoods—and that about a matter that lay nearest and dearest to his own wounded and remorseful heart—all this was utterly and wholly repugnant to Hugh Massinger's underlying nature. Set aside the wickedness and baseness of it all, the poet was a proud and sensitive man; and lying on such an extended scale was abhorrent to his soul from its mere ignominy and æsthetic repulsiveness. He liked the truth: he admired the open, frank, straightforward way. Tortuous cunning and mean subterfuges roused his profoundest contempt and loathing—when he saw them in others. Up till now, he had enjoyed his own unquestioning self-respect. Vain and shallow and unscrupulous as he was, he had hitherto basked serenely in the sunshine of his own personal approbation. He had done nothing till lately that sinned against his private and peculiar code of morals, such as it was. His proposal to Winifred had, for the first time, opened the sluices of the great unknown within him, and fathomless depths of deceit and crime were welling up now and crowding in upon him to drown and obliterate whatever spark or scintillation of conscience had ever been his. It was a hateful sight. He shrank himself from the effort to realise it.

And Warren Relf knew all! That in itself was bad enough. But if he also invented a continuous lie to palm off upon Winifred and her unsuspecting people, then Warren Relf at least would know it constantly for what it was, and despise him for it even more profoundly than he despised him at present. All that was horrible—horrible—horrible. Yet there was one person whose opinion mattered to him far more than even Warren Relf's—one person who would hate and despise with a deadly hatred and an utter scorn

the horrid perfidy of his proposed line of conduct. That person was one with whom he ate and drank familiarly every day, with whom he conversed unreservedly night and morning, with whom he lived and moved and had his being. He could never escape or deceive or outwit Hugh Massinger. *Patriæ quis exsul se quoque fugit?* Hugh Massinger would dog him, and follow his footsteps wherever he went, with his unfeigned contempt for so dirty and despicable a course of action. It was vile, it was loathsome, it was mean, it was horrible in its ghastly charnel-house false-ness and foulness; and Hugh Massinger knew it perfectly. If he yielded to this last and lowest temptation of Satan, he might walk about henceforth with his outer man a whitened sepulchre, but within, he would be full of dead men's bones and vile imaginings of impossible evil.

Thinking which things definitely to himself, in his own tormented and horrified soul, he—sat down and wrote another forged letter.

It was a hasty note, written as if in the hurry and bustle of departure, on the very eve of a long journey, and it told Winifred, in rapid general terms, that Elsie was just on her way to the Continent, *en route* for Australia—no matter where. She would join her steamer (no line mentioned) under an assumed name, perhaps at Marseilles, perhaps at Genoa, perhaps at Naples, perhaps at Brindisi. Useless to dream of tracking or identifying her. She was going away from England *for ever and ever*—this last underlined in feminine fashion—and it would be quite hopeless for Winifred to cherish the vain idea of seeing her again in this world of misfortunes. Some day, perhaps, her conduct would be explained and vindicated; for the present, it must suffice that letters sent to her at the address as before—the porter's of the Cheyne Row Club, though Hugh did not specifically mention that fact—would finally reach her by private arrangement. Would Winifred accept the accompanying ring, and wear it always on her own finger, as a parting gift from her affectionate and misunderstood friend,

ELSIE?

The ring was one from the little jewel-case he had stolen that fatal night from Elsie's bedroom. Profoundly as he hated and loathed himself for his deception, he couldn't help stopping half-way through to admire his own devilry of cleverness in sending that ring back now to Winifred. Nothing could be so calculated to disarm suspicion. Who could doubt that Elsie was indeed alive, when Elsie not only wrote letters to her friends, but sent with them the very jewelry from her own fingers as a visible pledge and token of her identity?—Besides, he really wanted Winifred to wear it; he wished her to have something that once was Elsie's. He would like the woman he was now deceiving to be linked by some visible bond of memory to the woman he had deceived and lured to her destruction.

He kissed the ring, a hot burning kiss, and wrapped it reverently and tenderly in cotton-wool. That done, he gummed and stamped the letter with a resolute air, crushed his hat firmly down on his head, and strode out with feverishly long strides from his rooms in Jermyn Street to the doubtful hospitality of the Cheyne Row.

Would Warren Relf be there again, he wondered? Was that man to poison half London

for him in future?—Why on earth, knowing the whole truth about Elsie—knowing that Elsie was dead and buried at Orfordness—did the fellow mean to hold his vile tongue and allow him, Hugh Massinger, to put about this elaborate fiction unchecked, of her sudden and causeless disappearance? Inexplicable quite! The thing was a mystery; and Hugh Massinger hated mysteries. He could never know now at what unexpected moment Warren Relf might swoop down upon him from behind with a dash and a crash and an explosive exposure.—He was working in the dark, like navvies in a tunnel.—Surely the crash must come some day! The roof must collapse and crush him utterly. It was ghastly to wait in long blind expectation of it.

The forged letter still remained in his pocket unposted. He passed a couple of pillar-boxes, but could not nerve himself up to drop it in. Some grain of grace within him was fighting hard even now for the mastery of his soul. He shrank from committing himself irrevocably by a single act to that despicable life of ingrained deception.

In the smoking-room at the club he found nobody, for it was still early. He took up the *Times*, which he had not yet had time to consult that morning. In the Agony Column, a familiar conjunction of names attracted his eye as it moved down the outer sheet. They were the two names never out of his thoughts for a moment for the last fortnight. 'ELSIE,' the advertisement ran in clear black type, 'Do write to me. I can stand this fearful suspense no longer. Only a few lines to say you are well. I am so frightened. Ever yours,

WINIFRED.'

He laid the paper down with a sudden resolve, and striding across the room gloomily to the letter-box on the mantel-piece, took the fateful envelope from his pocket at last, and held it dubious, between finger and thumb, dangling loose over the slit in the lid. Heaven and hell still battled fiercely for the upper hand within him. Should he drop it in boldly, or should he not? To be or not to be—a liar for life?—that was the question. The envelope trembled between his finger and thumb. The slit in the box yawned hungry below. His grasp was lax. The letter hung by a corner only. Nor was his impulse, even, so wholly bad: pity for Winifred urged him on; remorse and horror held him back feebly. He knew not in his own soul how to act; he knew he was weak and wicked only.

As he paused and hesitated, unable to decide for good or evil—a noise at the door made him start and waver.—Somebody coming! Perhaps Warren Relf.—That address on the envelope—'Miss Meysey, The Hall, Whitestrand, Suffolk.'—If Relf saw it, he would know it was—well—an imitation of Elsie's handwriting. She had sent a note to Relf on the morning of the sandhills picnic. If any one else saw it, they would see at least it was a letter to his fiancée—and they would chaff him accordingly with chaff that he hated, or perhaps they would only smile a superior smile of fatuous recognition and smirking amusement. He could stand neither—above all, not Relf.—His fingers relaxed upon the cover of the envelope.—Half unconsciously, half unwillingly,

he loosened his hold.—Plop! it fell through that yawning abyss, three inches down, but as deep as perdition itself.—The die was cast! A liar for a lifetime!

He turned round, and Hatherley the journalist stood smiling good-morning by the open doorway. Hugh Massinger tried his hardest to look as if nothing out of the common had happened in any way. He nodded to Hatherley, and buried his face once more in the pages of the *Times*. 'The Drought in Wales'—'The Bulgarian Difficulty'—'Painful Disturbances on the West Coast of Africa'—'Pah! What nonsense! What commonplaces of opinion! It made his gorge rise with disgust to look at them. Wales and Bulgaria and the West Coast of Africa, when Elsie was dead! dead and unnoticed!

A boy in buttons brought in a telegram—Central News Agency—and fixed it by the corners with brass-headed pins in a vacant space on the accustomed notice-board. Hatherley, laying down his copy of *Punch*, strolled lazily over to the board to examine it. 'Meysey! Meysey!' he repeated musingly.—'Why, Massinger, that must be one of your Whitestrand Meyseys. Precious uncommon name. There can't be many of them.'

Hugh rose and glanced at the new telegram unconcernedly. It couldn't have much to do with himself! But its terms brought the blood with a hasty rush into his pale cheek again: '*Serious Accident on the Scotch Moors*.—Aberdeen, Thursday. As Sir Malcolm Farquharson's party were shooting over the Glenbeg estate yesterday, near Kincardine-O'Neil, a rifle held by Mr Wyville Meysey burst suddenly, wounding the unfortunate gentleman in the face and neck, and lodging a splinter of jagged metal in his left temple. He was conveyed at once from the spot in an insensible state to Invertnar Castle, where he now lies in a most precarious condition. His wife and daughter were immediately telegraphed for.'

'INVERTANAR: 10.40 A.M. Mr Wyville Meysey, a guest of Sir Malcolm Farquharson's at Invertnar Castle, wounded yesterday by the bursting of his rifle on the Glenbeg moors, expired this morning very suddenly at 9.20. The unfortunate gentleman did not recover consciousness for a single moment after the fatal accident.'

A shudder of horror ran through Hugh's frame as he realised the meaning of that curt announcement. Not for the mishap; not for Mrs Meysey; not for Winifred: oh, dear no; but for his own possible or probable disfigurement.—His first thought was a characteristic one. Mr Meysey had died unexpectedly. There might or there might not be a will forthcoming. Guardians might or might not be appointed for his infant daughter. The estate might or might not go to Winifred. He might or he might not now be permitted to marry her.—If she happened to be left a ward in Chancery, for example, it would be a hopeless business: his chance would be ruined. The court would never consent to accept him as Winifred's husband. And then—and then it would be all up with him.

It was bad enough to have sold his own soul for a mess of pottage—for a few hundred acres of miserable salt marsh, encroached upon by the sea with rapid strides, and half covered with shifting, drifting sandhills. It was bad enough

to have sacrificed Elsie—dear, tender, delicate, loving-hearted Elsie, his own beautiful, sacred, dead Elsie—to that wretched, sordid, ineffective avarice, that fractional worship of a silver-gilt Mammon. He had regretted all that in sack-cloth and ashes for one whole endless hopeless fortnight or more, already.—But to have sold his own soul and to have sacrificed Elsie for the privilege of being rejected by Winifred's guardian—for the chance of being publicly and ignominiously jilted by the Court of Chancery—for the opportunity of becoming a common laughing-stock to the quidnuncs of Cheyne Row and the five o'clock tea-tables of half feminine London—that was indeed a depth of possible degradation from which his heart shrank with infinite throes of self-commiserating reluctance. He could sell his own soul for very little, and despise himself well for the squalid ignoble bargain; but to sell his own soul for absolutely nothing, with a dose of well-deserved ridicule thrown in gratis, and no Elsie to console him for his bitter loss, was more than even Hugh Massinger's sense of mean self-abnegation could easily swallow.

He flung himself back unmanned, in the big leather-covered armchair, and let the abject misery of his own thoughts overcome him visibly in his rueful countenance.

'I never imagined,' said Hatherley afterwards to his friends the Relfs, 'that Massinger could possibly have felt anything so much as he seemed to feel the sudden death of his prospective father-in-law, when he read that telegram. It really made me think better of the fellow.'

CURIOSITIES OF NOMENCLATURE.

THE origin of names is a subject which has in this age of research received its full share of investigation. Some writers and antiquaries have made Christian names their theme, and have pointed out the derivations and meanings of those male and female designations which are in common use among European nations. Others, again, have treated of surnames, showing the rise of the employment of such family designations, and the various influences displayed in their choice—influences which we may find even now in full force among the less civilised inhabitants of the world. Most common among these primitive fashions of nomenclature are, we learn, three classes of names: the first being adaptations of the names of places; the second embracing the numerous names ending in 'son,' and those with the Scotch and Irish prefixes of 'Mac' and 'O,' patronymics; the third, descriptive either of the personal characteristics or the surrounding circumstances of the bearers. Our list has no claim to be exhaustive of these phenomena, including nicknames, of which examples are by no means uncommon; but the very mention of this word nickname conjures up before our mental vision such an array of rulers and other public personages, whose personal appearance, whose characters or circumstances have suggested to some imaginative mind an appellation which has clung to their names ever since, that we must impose a restriction on our category, and only admit such designations as have replaced the original name, rather than

been added to it as a further means of identification.

The bearers of these appellations belong to divers ages, and come to us from widely varying countries and nations, though it is remarkable that the sober English mind lends itself but seldom to such trivialities. On the other hand, as might be supposed by any one who has the slightest acquaintance with the character of her light-hearted and impetuous people, Italy, both ancient and modern, supplies perhaps the largest contingent. The annals of the Roman Empire afford three notable examples. We should hardly recognise by his real name of Caius Cæsar the infamous Emperor Caligula; and yet that designation was in his own day only a nickname, derived from the *caligæ* or sandals of the common soldiers, which the young son of Germanicus had worn during his childhood in his father's camp. Hardly more familiar to us is either his real name of Bassianus, or the title of Marcus Aurelius Antoninus, assumed with the purple by Caracalla. In spite of his aversion to the appellation, which we are told he regarded as an insult, this equally ignoble emperor remains known to us by the name of another article of dress, the Gaulish cloak (*caracalla*), which he was fond of wearing, and introduced into the army. The occupation of another imperial ruler prior to his elevation to the throne as a priest of the Phœnician sun-god (*Elagabalus*) in his native city of Emesa gives him the name of Heliogabalus. That he should retain an earnest devotion to the god whose minister he had been, and to whose favour he would ascribe his advancement, is not surprising; but we can picture to ourselves something of the disgust with which a cultured Roman would pronounce the nickname, when we learn that he publicly appeared in the attire of a Syrian priest, dancing wild measures and singing barbaric hymns, and that he decreed that his outlandish idol, to whom he was even suspected of sacrificing human victims, should supersede the time-honoured Jupiter, Mars, and so forth, and be the only celestial power worshipped in Rome.

Of other rulers, the famous Charlemagne may put in a claim to be admitted into our category, for, although the artificial part of his name is merely equivalent to 'the great,' an epithet which the flattery of courtiers has not failed to apply to many a sovereign, it has become so incorporated in his name as to be almost inseparable from it. In later days, another French king was so universally known as Philip Augustus, that the title of Philip II. would hardly establish his identity. The addition of *Augustus* was, however, only a nickname due to the month of his birth. The monk's hood (*capet*) which distinguished Hugues Capet before he ascended the throne, gave a designation not only to an individual but to a dynasty; even as the floral badge of their ancestors, the broom, or *Planta genista*, distinguished in English history a long line of kings.

The names of certain celebrated Christian teachers also fall within the scope of our investigation. One of the greatest of the Fathers of the Church, John of Antioch, is known to us by the epithet of Chrysostom (signifying in Greek golden-mouth), in allusion to his eloquence. It is recorded that his sermon on one occasion produced so much enthusiasm, and so carried

away his audience, that, regardless of the incongruity of time and place, they burst out into expressions of applause. A peculiar practice, affected especially by scholars and divines, became common in the age of the revival of learning—namely, that of substituting for the real name the Greek or Latin synonym. For example, in accordance with this pedantic custom, the son of a Dutchman of the name of Gerhard (signifying amiable) comes to be known to us by its equivalent in both the dead languages as Desiderius Erasmus. Two other theologians of the Renaissance, who came over to England in 1548 to assist in the translation of the Scriptures, are similarly distinguished by translations of their patronymics. Kuhorn was easily rendered (by the two Greek words which signify respectively 'cow' and 'horn') into Bucer; while the German Buchlein (beech-tree) found the equivalent of his name in the Latin Fagius. Even where the name did not lend itself to translation, it was customary to give to us as far as possible a classical sound and to add a Latin termination. By this means it happens that one of the names best known to the student of divinity is preserved to us in its form of Calvin, and many would hardly recognise the bearer by his real patronymic, Chauvin.

We may now pass, disregarding of the ties of chronology, to some instances of epithets applied to certain individuals in Roman history by reason of some special quality or achievement. Two instances of inherited fame first present themselves. Britannicus, the unfortunate victim of Nero's hatred, was so called from the victories which his father, the Emperor Claudius, claimed to have gained in our island. The designation of Germanicus also came by inheritance to its bearer by reason of the conquest of the German tribes by his father, Nero Claudius Drusus; but in this instance the son gained an independent title to it by his military achievements. Another distinguished Roman name, that of Cato, reflects credit on its first bearer, Marcus Porcius, the Censor, as testifying to that practical wisdom which is the result of natural sagacity combined with experience. The qualities implied by this word *cato* received further acknowledgment in the epithet of Sapiens (the Wise) by which, according to Cicero, the same individual was so frequently distinguished that it became almost his cognomen. Legends, too well known to require recapitulation, recur to the memory at the very mention of the first Scævola (from the Latin *scævus*, left-handed), whose right hand had been sacrificed in defiance of his country's foe; and of the original Brutus (irrational), who was obliged to simulate idiocy to escape the death which Tarquin the 'Proud' had already visited on his father and elder brother. Personal valour at the siege of the Volscian city of *Corioli* obtained for Caius Martius, then a common soldier, the title of Coriolanus.

The lapse of centuries divides these characters in Roman history from three national heroes whom we may class together, although in character they have but little in common. George Castriot, the champion of Eastern Europe in the fifteenth century against the power of the Sultan, derives his name of Scanderbeg from an incident of his youth. He was the son of the Prince of Epirus, and having been delivered when a boy as hostage to the Turkish Sultan, Murad II.,

he had been brought up as a Moslem. At the age of eighteen, the Sultan's attention was attracted to him by his noble appearance and his skill in feats of arms, and he was advanced to the rank of *Sandjak-bag*, with the command of five thousand horse. In this capacity he so distinguished himself, that the title in corrupt form clung to him ever afterwards, even after he had forsaken Islam and taken up arms against the Porte. A less noble hero, the half-mad leader of the Neapolitan revolt of 1647, is distinguished as Masaniello, a contraction of his real name, Tommaso Aniello. No Scottish reader need be reminded of the celebrated Robert Magregor, whose sobriquet of Rob Roy (Robert the Red) reminds us of the nickname of Rufus (the Red) which clings to a king of England, and the Barbarossa (Red Beard) which distinguished a German emperor.

Perhaps no class of men have been so frequently known by their nicknames—for in their case the designations deserve no better name—as the disciples of art, especially the Italian painters. It may be that the bohemianism of the craft, its unconventionality and freedom from ceremony, lends itself especially to this practice. Certain it is that many of those who know something of the names at anyrate by which celebrated artists are usually known, would find their powers of recognition taxed to the utmost were they to see a catalogue of some famous gallery, the Louvre, for example, where the painters are all designated by their real names, and where, instead of the familiar Raphael and Titian, they must look for Santi and Vecelli, and in place of Perugino and Correggio, they find Vanucci and Allegri. These may serve as specimens of two easily multiplied classes of designations; the one, to which we might add Michael Angelo and many another of lesser repute, showing the exclusive use of the Christian name long after surnames had become customary; the other, including names no less famous than Da Vinci and Veronese besides a minor host, instances of local appellations. Claude Lorraine the great landscape painter may be taken as an example of one of the many artists who combine these two somewhat commonplace sources of unconventional nomenclature. Others inherit their names in a manner somewhat different from what is usual. Thus, three names high in artistic fame reveal to us the profession of the fathers of their most celebrated bearers. The brothers Pollaiuolo, workers in metal as well as painters, were, it is generally asserted, so called from their father's profession of 'poulterer,' which the word signifies. In view of this circumstance, perhaps, we may imagine that familiarity with the victims displayed in the paternal shop had something to do with the excellence of the quail modelled by Antonio on the bronze gate of the Florentine Baptistery, of which Vasari says, 'it wants nothing of life but to fly.' Another family trade, which would seem to promise equally little in regard to art, gave to Andrea Vanucchi, whose perfect execution gained for him in his own day the title of 'the faultless,' the appellation of del Sarto (of the tailor). Tintoretto, again, is the diminutive applied in childhood to the son of Robusti, a Venetian dyer (*tintore*). The names of others point not to their natural but to their artistic parent, and it is remarkable that in three cases at least the masters are chiefly known to us

through the assumption of their names in gratitude to their memory by their more eminent pupils. We refer to Francia, Botticelli, and del Vaga. The name of one painter, Ghirlandajo, is said to point to his former occupation as a goldsmith, and to his supposed invention of the silver ornaments in form of a wreath (*ghirlanda*) which became the fashion with the ladies of Tuscany. Sebastian del Piombo derived that title from his office of keeper of the leaden (*piombo*) seal of the papal chancery—a mere sinecure, to qualify for which he was obliged to take orders. A peculiarity of his art—namely, the frequent introduction of birds and other animals—gained for Paolo Doni the nickname of Uccelli (birds).

Individual characteristics give the clue to other appellations. Verocchio, the master who gave up painting when his pupil, the great Leonardo, excelled him on his own canvas in softness and brilliancy of colouring, had gained that name by the true eye (*ver-occhio*), which served him in good stead in his subsequent occupation of sculpture. It is amusing to find another nickname which may well be quoted here in contradistinction to the above, Guercino, whose squint (*guercio*), if it gave him his name, does not appear to have affected his artistic powers. We can find no record of the swarthy complexion which we should suppose to be implied by the title of Il Moretto (the Moor), by which a famous portrait-painter was distinguished. The small stature of Bernardino Betti gained for him the sobriquet of Pinturicchio (the little painter). Two men celebrated by their Christian names with an ending expressive in the one case of contempt, in the other of admiration, may next be cited. In Ghiberti's studio there was a boy who had so abstracted an air, was so utterly indifferent to the usual pursuits and sports of boyhood, and so negligent in dress and uncouth in manners, that his fellow-students called him Masaccio (Tommasaccio), dirty or slovenly Tom. By this ignoble nickname is one known who gave a new impulse to art. On the other hand, Giorgione (*giorgio-ne*), the great Venetian colourist, was distinguished even in boyhood by his tall noble figure and dignity of deportment, which gained for him from his playmates the suffix which renders his name equivalent to George the Great. But the greatest tribute of praise is found in the title of Fra Angelico, or Il beato Angelico, conferred on Brother Giovanni of the Florentine monastery of St Mark. We are told of the spirit in which he approached his work—how he ever knelt in prayer before taking up his brush; and in the record of his blameless life, no less than in the inspired beauty of his conceptions of the host of heaven, we find sufficient reason for the name by which he is known to fame.

We pass now to the last phase of our inquiry—the names by which some of the heroes of literature are distinguished. Here, again, the Italian nation leads the way. Their greatest poet, he 'who dreams and sees' for all nations and for all time, is known to us chiefly by his Christian name, and not even by that in its correct form of Durante, but abbreviated to Dante. An instance of change of name occurs to us in the case of another Italian writer, Metastasio, who was taken from the streets, educated and adopted by the learned lawyer Gravina. At his instance, the

boy changed his original name of Trapassi to that under which he appears before the world, Metastasio having in Greek the same meaning of 'transmutation.' One more Italian writer we may mention, the satirist whose venomous tongue and small respect of persons gained for him the title of the 'Scourge of Princes.' The name by which he is known as Pietro Aretino is derived from his birthplace, *Arezzo*. This mode of designation was, as we have seen, so common, that this instance would hardly deserve notice were it not from the significant fact that, on account of a satirical sonnet against indulgences, he was banished at an early age from his native city, and never again saw the place by the name of which he has been distinguished for more than three centuries.

The history of French literature acquaints us with the curious fact, that two of her greatest votaries are known by voluntarily assumed *noms de plume*. Not only are these the disguises under which they wrote, but they have in a degree unprecedented in comparatively modern times, superseded their real names. We may indeed doubt if the authors so well known as Voltaire and Molière would obtain universal recognition under their real names of Arouet and Poquelin. It has been suggested that Voltaire is an anagram of Arouet l. j. (*le jeun*); but we are not aware that any reason but an arbitrary choice has been adduced for the assumed title of the great comedian, who thus set an example now followed by the majority of those who make the stage their profession. In a comment on the names of these eminent Frenchmen, contained in the valuable series of 'Foreign Classics,' the author of the volume on Voltaire classes with them the essay-writer Montesquieu, whose name, he says, was De Secondat. We cannot, however, but think that the parallel is unwarranted, for the title of Baron de Montesquieu devolved upon the essayist from his uncle.

Thus such assumed names have but slight claim to be placed among those personages whom we have endeavoured to commemorate, personages of different nationality and different date, who have but little in common save the peculiarity that their names have been merged, either intentionally on their part, or by the will of their contemporaries, into variously derived and universally applied designations.

MISS BARKLE'S LEGACY.

BY EDWARD D. CUMING.

CHAPTER I.—A SURPRISE.

'If Selina Mary Barkle, only daughter of the late James Fransworth Barkle, of the Honourable East India Company's service, will communicate with Messrs Lambton and Warder, solicitors, 10 Holborn Lane, London, E.C., she will hear of something to her advantage.'

If any observant individual had chanced to be on the beach at the quaint little seaside town of Midport on the morning when the above advertisement appeared in the *Standard*, he might have witnessed the effect it produced on a lady who was seated on a low rock reading that newspaper under the shade of a very small parasol. The

lady, whose somewhat girlish dress made her seem younger than she really was, had as usual begun with the 'marriages,' and was absorbed in the mystic contents of the Agony Column, when she snatched at the paper with both hands and sprang up ejaculating 'Gracious me!' This she did with a degree of consternation quite comprehensible in view of the fact that she herself was no other than the Selina Mary Barkle therein referred to. She stood transfixed with astonishment, and held the newspaper firmly whilst she read the advertisement again. There could be no possible doubt that she was the person wanted; her father's name in full, along with her own, placed that beyond question. But what could Messrs Lambton and Warder want her address for? was her very natural reflection. What could they have heard to her advantage? She had not a relative alive in the world, that she knew of, and her worldly concerns were small enough to be retained in her own hands. Her father had departed this life some five years before our story opens, leaving her a sum sufficient to purchase an annuity of three hundred pounds a year; and on this income Miss Barkle led a quiet, retired existence, in a cottage on the outskirts of Midport, attended by a middle-aged couple, who took care of the house and garden.

She was a good-looking and amiable spinster of seven-and-thirty, whose charms, in spite of her youthful deportment, might without any breach of charity have been regarded as beginning to fade. Time had been when Selina Barkle's presence made men's hearts beat faster than was their wont; when her meaningless words were valued beyond their worth; when her eyes gave birth to hopes she fostered only for her lips to destroy; when, caring for none, she dallied with all, until her day of heedless conquest waned, and little more than its memory was now left to her. Her best friends could not call her an extremely wise person, and her enemies described her as a silly vain creature who did not know her own mind. She had not many foes, however, for she was a kindly, well-meaning woman, devoid of malice, whose chief failing lay in her unshaken belief that, as of yore, she had but to beckon, for men to come and worship. But here in Midport, men were few and far between, and hence opportunities of exercising whatever powers of fascination were left to her were correspondingly rare.

Miss Barkle recovered from her surprise, and folding up the now precious *Standard*, turned in the direction of her house. She would write to the address given by the next post; and whilst sensible that a mere letter would not procure the 'advantages' mentioned, she comforted herself with the thought that the solicitors who inserted the advertisement would tell her what to do. She was speculating with feverish curiosity on the nature of the news in store, when she reached the gate of the cottage garden, at which she found her bosom-friend and confidante, Miss Annie Carston, awaiting her.

'What's happened, Lina?' asked the young lady in a high clear voice. 'You look awfully serious.'

Miss Barkle took her friend's arm and walked her into the little drawing-room with an air of importance which her silence served to emphasise.

She closed the door carefully, handed the paper to Miss Carston, and looked on in triumph while her friend read and re-read the suggestive advertisement.

'You see, my dear, there's no mistaking the fact that I'm the person alluded to,' said Miss Barkle, relieved in being able to disburden her mind; 'and I'm going to write this minute asking what they mean and what I ought to do about it.'

Miss Carston, who was a trim, dark-haired little person, with a pretty animated face, said nothing. She was her friend's chief adviser on small matters; but this, she felt, was quite beyond her province. In so weighty an affair she could not help; and she watched Miss Barkle's preparations in silence until an idea occurred to her. 'Perhaps Mr Brawen might be able to advise you,' she said rather timidly.

'Why Mr Brawen, of all the lawyers in England, Annie?' responded Miss Barkle without looking up.

'Oh, I only thought because he lives here and you know him,' said Miss Carston a little incoherently, turning to look out of the window.

Miss Barkle went on with her letter and made no answer. She knew Mr Brawen; no one knew him better, she often said to herself, for that young solicitor was very fond of dropping in to tea of an afternoon at the cottage, and Miss Barkle was equally fond of seeing him there. The Midport gossips said that the lively man of law would go there once too often if he did not have a care, in spite of the lady's seniority; but the gentleman accepted their warnings in good part, and told his advisers that he could look after himself. It might have been mere coincidence, but was none the less true that Miss Annie Carston seldom failed to be present at the cottage during Mr Brawen's visits, and that he, as often as they met there, escorted her home to her step-mother's house, a quarter of a mile out of his own way. This was a proceeding, however, that gave Miss Barkle little uneasiness, as she could not think he 'saw anything' in such a girl as Annie, who was little more than nineteen, and childish for her age. She had indeed a very tender place for Mr Brawen in her own virgin heart, and really cherished the idea that 'something would come of it.' He was comfortably off, and with her own little property, they could do very well. True, she was seven years older than he; but no one, she imagined, suspected that; he certainly was not aware of it, and she saw no reason why he should find it out, so long as she didn't tell him. If he made the discovery after they were engaged, it would not matter much. Oh, he was all right; and she would not frighten him away by objecting to his civilities to her little friend.

She finished her letter, and turned round in her chair to find Miss Carston still gazing with dreamy, far-away eyes over the sea. 'I don't think I need refer to Mr Brawen yet, Annie,' she said. 'If there should be papers to sign or legal things to be done, he might of course be of use.'

If the 'something to her advantage' proved to be really worth hearing, she promised herself that Mr Brawen should be told about it soon enough; but there was no necessity to tell Annie that.

'Here's Captain Mulbane coming,' said Annie, hastily withdrawing from the window.

'Go and let him in, like a good child; and say I told you to scold him for coming before lunch.'

Annie left the room, and returned with the visitor, a hale, burly specimen of the British sailor, as buoyant and jovial now when nearly fifty as he had been at twenty. The world's cares sat lightly on the shoulders of Captain William Mulbane, R.N., and he was the most popular man in Midport, where most of the inhabitants of all ranks and classes regarded him as guide, philosopher, friend, and oracle. He came in now with one hand on Miss Carston's shoulder, filling the room with his genial presence and deep bass voice.

'I've come to congratulate you, Miss Barkle,' said he, holding out his hand. The lady thanked him, and begged him to sit down with a languid air which betokened the exhausting effect of a state of expectancy.

'How did you hear of it?' said she with serious interest.

'Saw it in the *Standard*, of course,' said the captain with a laugh.

'Ah, yes. I had forgotten every one would know,' said Miss Barkle, upon whom it suddenly dawned that her own copy of the paper was not the only one extant.

'It's all over Midport by now,' continued her guest. 'I hardly met a soul who didn't know about it.' He might have added, 'And I told every one who hadn't heard,' but left that unsaid.

The gallant officer had been constant in his attentions to Miss Barkle for a long time, but had received little encouragement from the lady. He was old enough to be her father, she told her friends, and no doubt considered his mature age an appropriate safeguard in allowing the intimacy to exist. Captain Mulbane was quite as regular in his attendance at the cottage as Mr Brawen; and although the two men were the best of friends, they had not as yet confided their respective ambitions to each other.

Miss Barkle had to submit to a severe cross-examination in the captain's endeavour to obtain her own opinion upon what might be expected to transpire, for he made a point of knowing everything, and would not allow the usual respect shown for other people's private affairs to obstruct his investigations. However, his blunt openness went unrewarded in this instance, and he left the cottage no better informed than he came, and spent the afternoon discussing the subject in all its possible bearings with his numerous friends.

To Midport society, which had little to occupy its mind, the occurrence was as welcome as an angel's message, and Miss Barkle, on her appearance out of doors, enjoyed all the attentions usually accorded to a public character. She could not remember having excited so much interest since she first 'came out' at Brighton—now more years ago than she cared to think—and was acknowledged to be one of the reigning beauties. Miss Barkle, in the new situation in which she was placed, felt that satisfactory warmth of heart which we obtain by benefiting our fellow-creatures without injury to ourselves. She was conscious of being a real benefactress in affording her friends

such a subject to talk about; and when she re-entered her cottage, it was in a state of pleased perplexity as to which of the eight ladies to whom she had promised to impart the news (when it came) first, was best entitled to the privilege.

She had hardly seated herself at the tea-table when a ring at the door-bell disturbed the current of her thoughts, and Mr Brawen was ushered into the room. He was a pleasant-looking, dapper little man, and was at once cordially welcomed and taken into confidence by Miss Barkle. What *did* Mr Brawen think she ought to do about that advertisement? She had written to the people who had put it in the paper, but hadn't the least idea what to do next. She had been longing to see him all day, and now he had come to her at last, what did he think?

Mr Brawen put down his cup and cleared his throat, whilst Miss Barkle leaned towards him with that look of appealing trust which used to do such terrible execution upon the victim of fifteen years ago. She had drawn no distinction in her own mind between Mr Brawen the friend and Mr Brawen the solicitor, and the gentleman took a business-like view of the case, considering it had been presented to him in his professional capacity.

'It will probably be necessary for you in the first place to get certified extracts from the registers wherein your birth and baptism are recorded. The clergyman of the parish where you were born and baptised would of course furnish them if you send to him; or if you wish it, I'—

'O no; thank you,' the lady hastily struck in. 'I couldn't think of troubling you for such a trifle; and besides, Mr Brawen, I can't conceive why the lawyers should want to know these particulars.'

John Brawen the friend might have indulged in a smile at the anxiety of Miss Barkle's tone; but John Brawen the solicitor preserved a judicial stolidity of countenance as he dryly explained: 'If it should happen, for instance, Miss Barkle, that money has been left you, the documents might be required to prove your identity. That is all.'

'Oh, that was all.' And Miss Barkle, to whom this had not suggested itself, regretted having betrayed what came uppermost in her mind at the mention of such papers.

He did not seem to have noticed it, and she felt relieved. It would be very simple to write to old Mr Trafford, the rector of Pellingham, the village where she first saw the light, and obtain the needful certificates, without assistance from any one. It did not matter how much or how little those London solicitors knew about her, but she had a perfectly morbid dread of her age being discovered by the man before her.

Mr Brawen did not display so much interest in the business as Miss Barkle had hoped and expected; he had given his advice in a plain straightforward way, without asking a single question. 'Just as if I had come to him and paid for it like anybody else,' she reflected with a pang of disappointment. Perhaps he thought she would not appreciate being questioned on a matter so purely personal; she would encourage him to share her expectations.

'It's a very curious thing altogether, Mr Brawen,' she said. 'You know I'm quite at a loss to think what it can be.'

'I daresay you will know all about it in a day or two,' he answered indifferently, whilst his attention wandered to the road outside.

'You know I haven't a relation in the world,' she continued pathetically, but without receiving any very comforting response. 'Really,' she said to herself, 'he might show a little more concern than this.' She was half sorry she had mentioned the matter to him at all, he seemed to take it so coolly—not more warmly, indeed, than if it had come before him in the ordinary course of his professional work.

That, in fact, was just the view Mr Brawen did take; and, as he confessed himself, he was not 'good at guessing.' He was, moreover, rather chagrined at not finding Miss Carston there as usual. That young lady, who engaged in ceaseless wordy skirmishes with her step-mother, spent most of her time in Miss Barkle's society, a practice which endowed the cottage with its only charm in John Brawen's eyes. He had other things to occupy him also this afternoon: his sister, who had just lost her husband, had signified her intention of coming down to join him at Midport as soon as she could get away. Of course he was ready to receive her; but some change would be necessary in his style of living, for the neighbours who had lodgings in the same house as himself were principally bachelors, addicted to nocturnal festivities, and musical entertainments more remarkable for vigorous execution than for talent. His rooms were, moreover, not suitable for the accommodation of a lady; and John Brawen was well aware that his sister, who had married a wealthy man, was somewhat exacting in her requirements. He would have to take a furnished house, and having little time to do it in, and no very clear ideas about those mysterious details which constitute a 'desirable residence,' felt that his own hands were for the time sufficiently full. He would have been glad to discuss the business with Miss Barkle, but he had found her too much absorbed in her own concerns; and if he could not feign an interest in them which he did not feel, he could at all events abstain from troubling her to-day with his difficulties.

Conversation flagged hopelessly; but Mr Brawen had no intention of leaving until the lateness of the hour compelled him to: he was particularly anxious to see Annie Carston that day to tell her of the change in his domestic arrangements, which he hoped might serve to bring them more easily together. He found little pleasure in seeing her at her step-mother's house; he was not a favourite with Mrs Carston, and mother and daughter appeared to direct their best energies towards making each other look foolish and uncomfortable, an exercise which usually culminated in their squabbling fiercely, to his considerable embarrassment.

Miss Carston, however, did not appear, and it was getting late when Brawen took up his hat to go. 'You will let me know if I can be of any use to you, Miss Barkle,' he said, as he shook hands. He felt bound to make the offer of his services, after she had asked his advice, and had not failed to see that his indifference was

displeasing to her. 'I have a good deal to do just now,' he added by way of apology, 'but am not too busy to give assistance to *you*, if you should want it.'

Miss Barkle's vexation melted away in a moment at his little speech, and the lingering memory of his listless unconcern faded as he laid stress upon 'you.' John Brawen had made his peace, if that were necessary, and so took his departure, wondering much why Annie Carston had not been to the cottage, when he had been careful to tell her the previous day that he intended calling there that afternoon.

About the time her admirer gave up expecting her, the young lady had concluded a final skirmish with her step-mother by declaring her resolve to leave the house for ever without an hour's delay. Life with Mrs Carston number two was beyond Miss Annie's powers of endurance, and being gifted with an enterprising spirit and some tenacity of purpose, she withdrew from the conflict under a heavy fire of scolding taunts, and made preparations to go with imperturbable coolness. She knew Miss Barkle would take her in if she went to her; and was further perfectly aware that John Brawen was only waiting for a suitable opportunity to make her a definite offer of marriage, so she felt tolerably easy as to the future. She did not, however, know the light in which that gentleman was regarded by Miss Barkle, or she might have done otherwise than form the intention of at once explaining to that lady her own relations towards him. So it happened that an hour after John Brawen had left the cottage, Miss Annie arrived with a quantity of baggage that promised a lengthened stay. Miss Barkle received her with open arms, and professed her willingness to give the young lady a home as long as she was likely to want one. But Miss Annie was spared the explanation she intended to make by Miss Barkle suddenly saying: 'Mr Brawen was here this afternoon, Annie. He was awfully nice, and offered to help me if it becomes necessary to have legal assistance.'

'I knew he would,' replied Annie Carston with a confidence that betrayed her knowledge of him.

'I was quite certain of it myself,' said Miss Barkle modestly; 'but you know I was a little afraid he might misunderstand me.'

'How could he misunderstand you?'

'He has been so much about the house lately, you know, Annie, and—and—well, you know how the people here talk.'

Miss Barkle raised a fire-screen and examined the pattern closely, to conceal the rising blushes; whilst her friend stared in blank astonishment. This was a revelation she had certainly never expected; but was it possible to suppose that Miss Barkle really believed John Brawen, her own Jack, had been dancing attendance at the cottage all this time drawn thither by her allurements? Manifestly, she did; and Miss Annie saw that if she meant to carry out her scheme of taxing that hospitable woman for shelter, it would never do to disabuse her of the idea; but it was scarcely fair and above-board to leave her in the dark. It was awkward, Annie felt, decidedly awkward, and had she only known it a few hours before, she would have put up with Mrs Carston's bitter tongue and irritating vagaries in preference to coming to her best friend under such false colours.

John Brawen had not actually proposed to her yet; but they fully understood each other, and she waited curiously until Miss Barkle should speak again.

'He's a good fellow, Annie,' said she warmly, from behind the fire-screen.

Miss Carston cordially agreed with this opinion, and felt that she must know all, if she died for it. 'When did he say? Did he speak to you, Lina?' she asked.

'He hasn't said anything really yet,' confessed the blushing Selina; 'but I'm sure he will before long.'

Miss Carston was hardly disposed to encourage the theory, and was relieved to find Miss Barkle had no stronger ground for her hopes than her own convictions. If that was all, she might fairly leave her to discover her mistake, and she bade her friend good-night with a smile of reassurance.

Miss Barkle also retired smiling. Hers was a sanguine nature; and that advertisement and the kindly pressure of John Brawen's hand as he left her were the foundations of a delightful castle in the air, which in her dreams contained a Mr and Mrs Brawen, whose income was a mysteriously acquired twenty thousand a year.

'NOT WANTED AT HOME.'

IN the following remarks, I wish to offer a few words of caution to the friends of those who are 'not wanted at home,' against sending them away to inflict them upon total strangers in any part of the world, but more particularly upon the inhabitants of the Great North-west of the United States of America, in which part I have for some years been a resident. In a majority of instances it is a great and fatal mistake. *Experto crede.* It is a step which should only be resorted to when it is intended to abandon the unhappy ones to their fate. Is it at all likely, when a youth has become so demoralised and debased, and has trodden the downward path at home so far, that all its influences for good—his mother's and sisters' tears—are spurned and of no avail, that he is going to regain his self-respect amongst 'strangers who know not him, nor his?' From my own experience and that of many others, I answer, 'No! a thousand times no!'

Few boys are by nature vicious—though there are of course cases of inherited diseases—but when a youth finds himself banished from home, from all that he ever cared for, from all that he is ever likely to care for, after the sting of the separation and banishment is over, he from that moment becomes callous, indifferent, hardened. What does he care for anybody any more, and who cares for him—whether he is sick or suffering or well—whether he prospers, or otherwise? Is it a matter of wonder if he goes from bad to worse? It is almost past belief how low down even those trained in circles of refinement and culture can get. They are restrained by nothing; and they meet with all the encouragement they want in their downward career. Finding themselves strangers in a strange land, they are lonely and home-sick; and as they are glad to associate with anybody, they are not

particular in their choice of companions, if indeed any choice be laid before them. It is most likely that those who first come to relieve their downheartedness are some who like themselves have seen happier days, but have fallen very low, and who too often take pleasure in drawing new-comers down to their own low level. This is especially the case if the new-comer—or greenhorn as he is called—have money; but if he has none, or when he has spent all he had, he may die in a ditch for all that any one cares. His newly-made friends have no further use for him; and respectable people *here* are just as glad to be rid of his presence as were the respectable people who sent him away from them.

It is not right or fair, in any sense, for people to foist their disreputable relations upon others. In many instances the fault lies largely at their own doors. Then what right have they to inflict this incubus upon others? Whether the fault be theirs or not, surely total strangers can be in no way to blame. The United States have for years past been generally chosen as the cesspool for European filth in the shape of hopeless inebriates, paupers, blacklegs, swindlers, &c., in short for all and every class which were 'not wanted at home.' The citizens have, however, become alive to this fact, and now resent the advent of such into their midst. There are just as respectable people out here, who have sons and daughters to bring up and families to regulate, as in Europe, though by many over there this fact would appear to be unknown, or at least overlooked. All good citizens in America are anxious to bring up their children in industry and respectability; and it is a well-known characteristic of the United States—and this, at the present time, applies from Maine to Florida, from New York to San Francisco—that everybody works and works hard, unless incapacitated by infirmity, from the highest to the poorest. To work is honourable here; to be idle is a disgrace. What, then, can such a people have here for the idle and worthless 'cast-offs' who are 'not wanted at home?' At the same time, be it clearly understood that the United States of America and her citizens receive and welcome with open arms all such as are steady and able and willing to work. For these, and these only, are the people to develop and build up a new country, and to such men-immigrants all possible inducements are most frankly and liberally offered.

For a long time, little or no complaint was heard respecting indiscriminate importation of persons of all classes or conditions; and no inquiry was made as to the previous history or antecedents of any immigrants, or at least practically none. But that state of things has in a great measure passed away; and such general dissatisfaction has prevailed as to cause the enactment of laws to prohibit the wholesale importation of disabled paupers, convicts, *et hoc genus omne*. This is a free country; but I warn each and every one of the class 'not wanted at home,' that they are not wanted here either; that unless they can behave themselves when they do come here, it is not a good place to come to, and that they had better stay where they are.

Apart from all this, I should like to ask the parents, guardians, or friends of those who are so

unhappily situated as to be 'not wanted at home,' a few questions. Does it mend matters, or add to your respectability, to have simply cast the wayward one out of your sight? Is your peace of mind greater because you do not see him every day? Does it add to your respectability at home, if he is lying drunk in the gutter, or in the lock-up, or working out a sentence on the stone-heap in the public streets of some town, with a chain round his leg and a ball attached thereto, like a poor slave, because all this happens in a foreign country and away from home? Did your Christmas dinner taste the better, or did some family gathering pass off more pleasantly, because the absent one was perhaps nearly frozen and hungry and shivering in the streets with the bitter cold of a North-western winter, and the—if possible—colder indifference of the passers-by; or perhaps was sweltering under the scorching sun of the treeless, shadeless prairies; or—worse by far than either—was listening to, and it is more than likely taking part in, ribald songs and unseemly jokes and stories at some drunken debauch?

In fine, I ask, does the fact of his being *out of your sight* and away from his home, make you forget that he is *in the sight of and before strangers*, who have no sorrow, no pity for him, only contempt and disgust? Does all this make matters any better? I, for one, cannot think so. If he was bad and vicious near you, depend upon it he is ten times worse far away. At least, such is my experience during some years, during which I have witnessed not a few, but, alas, very many instances of the truth of what I say. Leave no stone unturned, leave no remedy untried, before this last, and generally disastrous step of casting any wayward one out of your sight is taken. It is only in rare and very isolated cases, indeed, that any benefit comes of it. If *you* have no control over him, you can neither expect strangers to have it, nor to trouble themselves about him. Even were they to do so, their influence can never be like that of home and of the dear friends there. Adversity and hardship are good schools; but they may also be *too* severe. Fire purifies metal; but if the ore be left in it too long, or if the fire be too hot, it is apt to spoil and make it valueless. At all events, as I have said, the Great Northwest is not for worthless or idle men or boys, and its people do not care to see them.

IN A TURKISH CITY.

CONCLUDING PAPER.

THE pelting rains which afflict the country all the winter are over for the season; the sun is making all the plants grow with marvellous rapidity, though it is not yet strong enough to scorch the young shoots; therefore, it is a fitting day to call on an acquaintance whose hobby is flower-growing. He is a sailor, and perhaps that is why, when he does get ashore, he makes his little garden as trim and tidy as the deck of a ship, and will not let a square inch of ground go unused. Scodra is twenty miles from the sea, and the Boiana is too shallow to be navigable; but for all that, we have the headquarters

of a portion of the Turkish navy in our midst. Whenever there is a war between Montenegro and Turkey, Lake Scodra is the scene of many a naval battle unrecorded in the pages of history; and accordingly, when the late war broke out, an imposing fleet of threepenny steamboats and a launch was somehow or other coaxed over the rapids and shallows of the Boiana when the river was swollen with the autumn rains. No doubt these vessels did some service; but the commodore is not a talkative man, and prefers his flowers to his ships. To-day, I mean to see the flowers; so, early in the afternoon, an English friend and myself start for the commodore's house, after previously making sure that he is at home and ready to receive us. Achmet is engaged about the house, and so we take my friend's servant to precede us through the streets. '*Casa di vaporji*' (the steamboat man's house) is the direction given him in the curious polyglot language that prevails in this part of the world, and drives to distraction tourists, who travel with every question you can possibly ask in seven different tongues in seven parallel columns.

This man deserves a line or two to himself, as in his way he is the type of the lower-class Christian of the town. As he stalks proudly in front of us, with a couple of brass-handled pistols stuck in his belt, he is a very stately and warlike-looking person; but a few weeks ago he was an altogether different object. In his childhood he played about the narrow streets of the Christian quarter, dressed in a thin cotton shirt in summer, and wrapped in a bit of blanket in winter, and most probably learned to smoke when he was about seven years old. As he grew up, he spent his days hanging about the courtyard of some merchant or rich man, turning his hand to all sorts of odd jobs, when he could not get his piece of maize-bread without exertion, and at night sleeping under the lee of a wall or in an outhouse. In spite of having no visible means of subsistence, he always had some tobacco to twist into a cigarette; and possessed a rusty old flint-lock pistol for use on grand occasions. When the war began, and there was consequently a relaxation of authority, he and some kindred spirits took to foraging expeditions on their own account, and coming into collision with the *zaptiehs*, got thrown into prison. When a man gets into prison in Turkey, he generally stays there, unless he has a great deal of money or luck, and Giorgio proved no exception to the rule. In his case, luck opened the doors of his prison after he had had a pretty lengthy experience of durance vile.

His old mother, who led the same sort of hand-to-mouth existence as himself, was fortunate enough to get the rough washing and cleaning-up to do at one of the European consulates; and after some months, summoned courage to petition the consul's wife to beg the consul to ask the pasha to let her son out of prison. The consul being good-natured, promised to look into the matter; and learning that Giorgio had committed no crime, but had been incarcerated chiefly on suspicion, one day put the case before the Vali, with the result that the pasha, who was of course utterly ignorant of the whole affair, immediately set Master Giorgio free.

When he came out, he was a lank, lean, and

hungry-looking object, clothed simply in a shirt and trousers of the thinnest cotton, and with a felt skullcap on his head. For some weeks he almost regretted his liberty, and was inclined to repent of his mother's influence with those in power; but at last luck befriended him again, and he was engaged as servant by an English traveller. He at once discarded the old shirt and trousers, and assumed the mountaineer dress of white felt embroidered with black silk, in which we now see him. He no longer slinks about like a famished wolf, but, proud of being in the service of a Frank, and certain that a good supper awaits him after *Aksham*, he precedes us with head erect and all the stately swagger of his race.

But by this time we have arrived at the commodore's. A stream separates the road from his garden wall; and crossing the single rough plank that serves as a bridge, Giorgio knocks loudly at the great gates. Presently a voice within inquires who we are, and on Giorgio replying proudly, '*Ingliz milordo*,' the gates are thrown open, and we enter. The commodore, or *vaporji*, as Giorgio calls him, rises at our entry from the garden couch upon which he has been watching the watering of his beloved flowers. We sit down, one on each side of our host. A sailor instantly provides us with cigarettes and brass ashtrays, and then, with his hand on his heart, proffers us a red-hot coal in a little pair of tongs, instead of matches. We have interchanged compliments, and now sit silently inhaling the fragrant tobacco, and looking at the four sailors who are watering the flowers under our host's directions. The garden is a tiny square patch of ground wedged in between the high white walls of the neighbouring houses, and with the commodore's little cottage opening into it. The entire available space is cut up into beds by straight paths about eighteen inches wide, which are scrupulously weeded and laid down with powdered shells. Every bed has its flowers planted in mathematical straight lines; and it is easy to see that tulips are the commodore's favourites; but no one plant is allowed to take up more room than another; and the whole place, trim and neat, with every square inch of available soil put to its fullest use, shows incontestably that the sailor's tidiness does not forsake him when on shore.

The cottage is full of sailors, for the commodore naturally does not mean to go to the expense of keeping a servant when he has all the men of the fleet on Lake Scodra under his command. Another blue-jacket brings us coffee; and then we follow our host in Indian file along the narrow white paths, to inspect the beauties of nature more closely. The commodore is a stout man, in a baggy uniform, that fits him like a sack; and as he winds along the tiny paths, he reminds one irresistibly of a tight-rope dancer. However, he steers his way with marvellous skill, never kicking a single shell on to the flower-beds, and explaining to us as he goes that the garden will look much better in another week, showing us where some of his choicest specimens have been planted, but have not yet shown above ground, and pointing out the buds that lie concealed among the green shoots of others that have come up—and all with the simplicity of a child, and with the grave interest that only a real lover of

flowers who is also a Turk or a Dutchman can exhibit.

After the inspection of the garden, we resume our seats, and more coffee is brought to us. The conversation now turns upon naval matters, upon which the commodore is quite willing to enter, but hardly with the quiet enthusiasm with which he discourses on his flowers. Our host tells us that before coming to North Albania, he was in command of a gunboat on the Danube during the Russo-Turkish war. We cannot discover that he did anything in particular or fought any actions with the Russians; but as he seems to have kept his boat out of harm's way, and not to have wantonly exposed any of the sultan's men or ships, he was doubtless marked out for promotion. The flotilla on the lake consisted originally of three boats; but one is somewhere at the bottom of the Boiana; and so the two survivors are judiciously kept in the lake, in case they should also come to grief if they again attempted to pass the shallows and rapids of the river. The commodore asks us if we should like to go over the fleet, and we accept with pleasure; so, after the final directions have been given to the four gardening sailors, we set off in procession for the bazaar and the outlet of the river Boiana. Giorgio goes first, perhaps with a prouder air than usual; next comes the commodore, sandwiched between our two selves; while the rear is brought up by two sailors. In this order, and at a grave and solemn pace, we proceed through the streets, past the great burial-ground where Ali Haidar Pasha lies buried; and turning aside by the well without entering the bazaar, cross the fields to a spot known as the Twelve Trees. There are only four trees left now to stretch their tall branches towards the cloudless sky, and a melancholy story attaches to them. Standing alone on the bank of the river, they have always been a mark for the thunderstorms which are such constant visitors to Scodra, and gradually their number has been reduced. Only a few years ago, a shepherd and his sheep crouching under their shelter from the pelting storm, were struck by lightning, and all killed; and the scarred trunk of one of the trees still standing serves as a grim reminder that next autumn another may fall victim to the lightning-flash.

A great deal of shouting from the two sailors who accompany us brings a man-of-war's boat from the other side to carry us across to the steamers. We enter the boat, Giorgio and the two sailors remaining on shore. The commodore takes the tiller, and the lithe little crew from the Black Sea coast take us rapidly towards the lake; and it is as well they do so, for before we have gone very far, we discover that the water is unpleasantly high in the bottom of the boat. The commodore explains that this is one of two new boats lately sent from Constantinople, and that they were left some time on the shore at the mouth of the Boiana before being brought up the river, and consequently some of the seams have started. He trusts resignedly that they will close when the boat has been in the water a little while, and meantime counsels us to put our feet up on the thwart in front of us. The brown little sailors are dressed much as sailors usually are, except that they wear the fez, which

has become almost the only distinguishing part of an Ottoman Turk's dress; for their loose trousers, and shirt with full wide collar of dark-blue cotton, might be worn by the mariners of any power. In a few minutes' time we bump against the side of the flagship, and mount the broad and commodious ladder which hangs over the side. Both the commodore and his second in command are stout and dignified, and have no intention of scrambling up the side even of a penny steamer in any but the very easiest fashion.

The captain having seen us on the shore, has made preparations in our honour by girding on his sword and hastily buttoning up the front of his uniform all awry. He salaams courteously; and the bright blades of four sailors drawn up in line flash in the sunshine as they salute the commodore and ourselves. Instantly four rush-bottomed chairs are thrust up the hatchway by an unseen hand, and we take our seats in a circle, while cigarettes and coffee are handed round—a ceremony which it would be a most terrible breach of etiquette to omit. This done, we stroll round the ship, a duty very quickly finished. The vessel carries two guns, one a little brass popgun in the bows, used for firing salutes; and the other a long Krupp gun in the stern, which would in all probability shake the old tub to pieces if it were fired. In the cabin below, a dozen Martini-Peabody rifles, and as many cutlasses, all well kept and brightly polished, are arranged in a stand, and constitute the armament of the ship's company.

As for the vessels themselves, they were built at Glasgow about the commencement of the Crimean war, and after doing good service on the Clyde, were bought by the Turkish government, and transferred to the Bosphorus. There they ran to and fro for some fifteen years, and then the Porte conceived the brilliant idea of turning them into men-of-war, and sending them into Lake Scodra to aid in the campaign against Montenegro. On the wheel are recorded the builder's name and the date. Poor old boats; they still do the journey backwards and forwards across the lake, especially when any distinguished personage wishes to go from Scodra to Montenegro; and after the signature of the Virbazar Convention, they transported several families of ragged refugees into the already poverty-harassed city of Scodra.

The commodore evidently takes a sort of pride in his command, although he admits that he can get no great speed out of his ships. Pressed on this point, he confesses that he does not know their rate of speed, but that it takes several hours to steam to Lissendra, at the far end of the lake. 'No, there is no coal; that is a great drawback. Sometimes a ship brings coal, and leaves some at Medua for the squadron; but there has been none for some time past. They burn wood; and when they cross the lake, the whole deck is cumbered with firewood, so that at first there is hardly room to move; but the furnaces burn such a quantity that the pile is soon diminished.'

The captain tells us with considerable satisfaction that he can speak English; but as he makes this avowal in Turkish, we are naturally rather sceptical on the point, until it slowly

dawns upon us that the queer sounds with which he follows up his assertion are English words of command—'Easer, stopper, bakker, turnerastern, goaed.' The captain reels off the phrases in a low voice, without pause or inflection, and looking very like a sheepish schoolboy repeating a French lesson. He also gives us the English names for parts of the engines and gear; for the Turks, like most eastern races, have adopted the English terms for machinery and the like, the Turkish language even boasting such a verb as 'Trnrstrn-etmk,' which means, 'to turn her astern.'

But the sun is drawing near Mount Rumia; and if we wish to be home before *Aksham*, we must leave at once; so, as the commodore expresses his intention of remaining on board for some time longer, we take leave of him and the captain, and once more trust ourselves to the leaky boat. On shore, Giorgio receives us, evidently rather bored by his long wait; and after giving a present to the boat's crew, we join the crowd of merchants going home from the bazaar, and reach the house just as the muezzin is mounting the rickety wooden minaret of the mosque near my door and preparing to summon the Faithful to the evening prayer.

A NOVEL ASCENT.

SOME little time since, under the title of 'A Subaqueous Excursion,' we embodied our impressions on visiting the caissons of the Forth Bridge at Queensferry, and portrayed the scenes enacted in the air-chambers, where, some ninety feet below water-level, the foundations of the huge structure were being excavated. All this is now changed; the busy workers no longer ply pick and shovel deep down beneath the water; but high up in mid-air above the 'gallant Forth' are rearing the steel superstructure of the giant cantilevers. The main steel piers are now erected to their full height, and their ascent forms an expedition so novel and unique, that we have endeavoured to briefly depict our experiences in gaining the summit.

Leaving the classic *Hawes Inn*, immortalised in the *Antiquary*, and which at one time or another has sheltered many historic personages on their way across the Forth, a steam-launch conveys us to Inchgarvie, the island in mid-channel. We pause on landing, and look upwards at the mighty towering structure. The Forth Bridge stands three hundred and sixty feet above water-level, below which its foundations at their greatest depth extend some ninety feet—giving an overall measurement of about four hundred and fifty feet—a height but little exceeded by the Great Pyramid of Egypt, which reaches four hundred and sixty feet, or by Cologne Cathedral and Old St Paul's, standing respectively five hundred and ten and five hundred and eight feet above ground-level.

The 'cage' which we now enter will accommodate about a dozen men. It is strongly constructed of steel, and differs but little from those similarly employed in coal-mines. The bar across the entrance is closed; a signal is given to the man in charge of the winding-engine, and we are off. Visits to collieries have been so frequently described, that the sensations generally experi-

enced are tolerably familiar, at least on paper, even to those who have never personally ventured on that somewhat trying novelty. But here all is reversed. The same cage is attached to a wire-rope, wound by a similar hauling-engine; but darkness gives place to light, and the dread feeling of sinking into the bowels of the earth never to return yields to a sensation of easy and luxurious elevation and airy ascension, as we rise higher and higher through complex masses of bracing and strutting, till we land on the platform at the summit, and jumping from the cage, experience a pleasing sense of exhilaration in the fresh breezes, the vast expanse of country open to our gaze, and the thought that we have beneath us the largest railway bridge in the world.

A glance over the edge reveals to us the very great height at which we stand. Far below in the giddy depth we see men, reduced to the size of pigmies, hurrying about; whilst the guardship is dwarfed into a toy-boat. The view is one never to be forgotten. It is a clear day, and one by one we see the islands of the Forth reposing on its placid surface, and mark the grand outline of the western hills, fading away into the blue distance. Arthur's Seat stands sharply marked against the glowing skies, and the smoky canopy of Auld Reekie fringes the glories of the beautiful grounds of Dalmeny. Turning northwards, Inverkeithing and 'Dunfermline gray' lie almost at our feet, and the Ochil Hills flank a scene seldom if ever surpassed.

We turn from the beauties of nature to the gigantic cantilevers beneath our feet, and mark the busy workers at their toil. No light task that, to labour hour after hour betwixt heaven and earth, summer and winter. All honour to British pluck and determination, to the minds that direct, and the hands that execute such an undertaking!

THE POET'S WORLD.*

He lives within a world which he has made
But for himself from out all things most fair,
Where perfect light dies into perfect shade
'Neath endless summer air.

There is not any winter in that land,
Nor spring-time born to fade and die too soon;
But every breeze by which his cheek is fanned
Breathes a perpetual June.

He crowns himself with royal crown of bay,
And laughing, bids the flowers to laugh with him;
Then wanders forth, all happy, till the day
Dies, and the eve grows dim.

He is a Child! O let him have his will,
And dream his dreams, and use his every breath
In song and rhyme and innocent mirth, until
His voice is hushed in death!

J. S. FLETCHER.

* Suggested by the peculiarity of one 'Daft Jemmie,' who innocently imagined himself to be a great poet.

ARTIFICIALITY.

A DEFENCE of artificiality may seem scarcely compatible with the warnings against its dangers with which from our childhood we are made familiar. It is easy enough to see why, from the commonplace point of view, our parents and teachers so warmly inculcate the merit of naturalness; but is it not just possible that, on the contrary, most of us do not sufficiently study how to be gracefully artificial—that, in short, we neglect to introduce enough art into the artificiality of every-day life? Our pastors and masters preach to us the moral rectitude of being natural; but were the doctrine carried out to the letter, is it not clear that life with our fellow-creatures would become intolerable? Without a large dash of artificiality, it is certain that refined existence would be impossible. It is difficult, indeed, to imagine a state of existence from which all artificiality should be banished. Good-breeding in itself largely consists of what, when it comes to be analysed, is essentially artificial, for good-breeding demands a due consideration for the failings and weaknesses of those with whom one may be brought in contact. The concession to such weaknesses distinctly carries with it an element of artificiality from which it is impossible to escape.

Your horny-handed son of toil fresh from the fields is natural enough; but when brought into town, how little his awkwardness chimes in with the accepted standard of urban civilisation, or how little can it be held up as affording any of that moral beauty which, if we are to believe some teachers, is naturally associated with the possession of naturalness, and *mutatis mutandis*. The loud laughter of the uncultivated is natural enough; but how jarring is its effect on the nerves of the refined. We are apt, in a thoughtless way, to say that the noble savage is natural; but an acquaintance with his manners and customs proves how complicated, under its apparent absence of affectation, is the ritual of his existence.

With the very first germs of civilisation, artificiality may be said to have commenced its sway; indeed, civilisation may be said to consist in properly understood artificiality. As a matter of fact, our teachers, instead of warning us against the dangers of an absence of naturalness, should urge the introduction of more art into our artificiality. What, indeed, is that truly invaluable quality of tact, in which so many of us are sadly wanting, but a very highly developed form of artificiality? The artificiality of the well-bred man of the world, how admirably it serves him in cases where downright naturalness would simply disgust society! There is a good story told of Lord Palmerston once keeping a corporation dinner waiting some two hours or more after the appointed time. When at length his arrival seemed hopeless, it was determined that it would be best to commence without his presence. On his appearing, a few moments later, his ready tact enabled him to throw on his entertainers the whole awkwardness of his own want of punctuality, by expressing his delight at his hosts having commenced without waiting for him. Were it not for polished artificiality of this nature, how could life continue?

Those good folk who cry out so loudly for naturalness seem to be oblivious how largely the friction of every-day life is avoided by well-considered artificiality. What is more perfect than the artificiality which makes a well-bred person conceal his feelings from the persistent button-holder, or the even more polished and enviable artificiality which enables the well-bred possessor of tact to shake off the attentions of the bore, whose conduct, let it be remembered, is thoroughly natural? What is more graceful or necessary than the artificiality with which a person of delicate taste will conceal from a stranger or a dear friend the pain that is being endured or the grief that is felt?

Those folks who pride themselves on their naturalness are, after all, only indulging their innate selfishness; it costs a little trouble to be artificial; it is ever so much easier to speak

out whatever first enters our heads. Beshrew such naturalness! A little artificiality will contrive to rob of its sting and annoyance a criticism or a piece of advice which would otherwise fail utterly of its purpose, if it be any other than to ruffle the temper of the recipient. With a little more artificiality introduced into married life, is it not evident that the sum of misery caused by 'incompatibility of temper' would be reduced? But no. We are told that we must be natural; and so husband and wife go their own ways, regardless of each other's failings, to conciliate which in any manner would demand a call upon that artificiality which is so universally decried and clumsily practised. Would it not be far happier for both were they mutually to pretend to overlook, indeed not to notice, each other's troublesome failings? Would not thus a grain of artificiality succeed in enabling even characters otherwise utterly incompatible, to get on very satisfactorily? Indeed, were this not well understood by a great number of excellent people, how miserable would be the world!

Nowadays, those who move much among their fellow-creatures hear a good deal about what is termed Bohemianism, and it is argued that those who join its motley ranks have done so because they chafe against the artificiality of modern existence. It is a specious plea set up by every backslider from the paths of respectability. The truth is that the artificiality of social intercourse implies an element of restraint which is found irksome, and so your Bohemian—in the bad sense—and your ne'er-do-well, in order to enjoy themselves, fall back upon the society of those nominally free from artificial tendencies—with what result is it necessary to state?

Is it not clear that in cases such as these the artificiality of society has its good points? Discipline of every nature, military or official, is largely composed of artificial elements, without which government would be impossible. 'There is but a form between yourself and your shoemaker,' once remarked that model of well-bred artificiality, Bulwer-Lytton. The forms of everyday life, without which it would be difficult to exist, are artificial to a degree. The requirements of society in what is termed etiquette are essentially artificial, and the code has been drawn up with a care which is not the result of fancy or caprice. Deep artistic consideration has been given to every point. In the item of dress, which is specially artificial, how rarely man, but more particularly woman, is seen to advantage when natural! Painters and sculptors may admire humanity in its workaday costume, because that costume is appropriate to its wearer; but the artificiality of our complicated social existence has made it a hereditary instinct with most of us to be careful how we are too natural in the presence of those whom we wish to impress with a sense of our dignity. We are aware that it is dangerous to be seen by everybody in our shirt-sleeves, which constitute, however, a very natural dress.

Sum-total: It is evident that the ethics of artificiality have not received that attention to which as a science they are entitled. It is a deficiency in our social education that the bearings of rightly understood artificiality are not more thoroughly inculcated. Paradoxically, it

may be said that it is the absence of artificiality in our modern complicated ritual of every-day life which is the cause of much of that friction from which we all suffer.

THIS MORTAL COIL.

CHAPTER XXI.—CLEARING THE DECKS.

WARREN RELF had arranged for his mother and sister, with Elsie Challoner, to seek the friendly shelter of San Remo early in October. The sooner away from England the better. Before they went, however, to avert the chance of a disagreeable encounter, he met them on their arrival in town at Liverpool Street, and saw them safely across to the continental train at London Bridge. It chanced to be the very self-same day that Hugh Massinger had posted his second forged note to poor fatherless Winifred.

Elsie dared hardly look the young painter in the face even now, for shame and timidity; and Warren Relf, respecting her natural sensitiveness, concentrated most of his attention on his mother and Edie, scarcely allowing Elsie to notice by shy side-glances his unobtrusive preparations for her own personal comfort on the journey. But Elsie's quick eye observed them all, gratefully, none the less for that. She liked Warren: it was impossible for anybody not to like and respect the frank young painter, with his honest bronzed face, and his open, manly, out-spoken manners. Timid as she was and broken-hearted still, she could not go away from England for ever and ever—for Elsie never meant to return again—without thanking him just once in a few short words for all his kindness. As they stood on the bare and windy platform with which the South-Eastern Railway Company woos our suffrages at London Bridge, she drew him aside for a moment from his mother and sister with a little hasty shrinking glance which Warren could not choose but follow. 'Mr Relf,' she said, looking down at the floor and fumbling with her parasol, 'I want to thank you; I can't go away without thanking you once.'

He saw the effort it had cost her to say so much, and a wild lump rose sudden in his throat for gratitude and pleasure. 'Miss Challoner,' he answered, looking back at her with an unmistakable light in his earnest eyes, 'say nothing else. I am more than sufficiently thanked already.—I have only one thing to say to you now. I know you wish this episode kept secret from every one: you may rely upon me and upon my mate in the yawl. If ever in my life I can be of any service to you, remember you can command me.—If not, I shall never again obtrude myself upon your memory.—Good-bye, good-bye.' And taking her hand one moment in his own, he held it for a second, then let it drop again. 'Now go,' he said in a tremulous voice—'go back to Edie.'

Elsie—one blush—went back as he bade her. 'Good-bye,' she said, as she glided from his side—'good-bye, and thank you.' That was all that passed between those two that day. Yet Elsie knew, with profound regret, as the train steamed off through the draughty corridors on its way to Dover, that Warren Relf had fallen in love with her; and Warren Relf, standing alone upon the dingy, gusty platform, knew with an ecstasy of

delight and joy that Elsie Challoner was grateful to him and liked him. It is something, gratitude. He valued that more from Elsie Challoner than he would have valued love from any other woman.

With profound regret, for her part, Elsie saw that Warren Relf had fallen in love with her; because he was such an honest, manly, straightforward, good fellow, and because from the very first moment she had liked him. Yet what to her were love and lovers now? Her heart lay buried beneath the roots of the poplar at Whitestrand, as truly as Hugh Massinger thought it lay buried in the cheap sea-washed grave in the sand at Orfordness. She was grieved to think this brave and earnest man should have fixed his heart on a hopeless object. It was well she was going to San Remo for ever. In the whirl and bustle and hurry of London life, Warren Relf would doubtless soon forget her. But some faces are not easily forgotten.

From London Bridge, Warren Relf took the Metropolitan to St James's Park, and walked across, still flushed and hot, to Piccadilly. At the club, he glanced hastily at that morning's paper. The first paragraph on which his eye lighted was Winifred Meysey's earnest advertisement in the Agony Column. It gave him no little food for reflection. If ever Elsie saw that advertisement, it might alter and upset all her plans for the future—and all his own plans into the bargain. Already she felt profoundly the pain and shame of her false position with Winifred and the Meyseys: that much Warren Relf had learned from Edie. If only she knew how eagerly Winifred pined for news of her, she might be tempted after all to break her reserve, to abandon her concealment, and to write full tidings of her present whereabouts to her poor little frightened and distressed pupil. That would be bad; for then the whole truth must sooner or later come out before the world; and for Elsie's sake, for Winifred's sake, perhaps even a wee bit for his own sake also, Warren Relf shrank unspeakably from that unhappy exposure. He couldn't bear to think that Elsie's poor broken bleeding heart should be laid open to its profoundest recesses before the eyes of society, for every daw of an envious old dowager to snap and peck at. He hoped Elsie would not see the advertisement. If she did, he feared her natural tenderness and her sense of self-respect would compel her to write the whole truth to Winifred.

She might see it at Marseilles, for they were going to run right through to the Mediterranean by the special express, stopping a night to rest themselves at the *Hôtel du Louvre* in the Rue Cannebière. Edie would be sure to look at the *Times*, and if she saw the advertisement, to show it to Elsie.

But even if she didn't, ought he not himself to call her attention to it? Was it right of him, having seen it, not to tell her of it? Should he not rather leave to Elsie herself the decision what course she thought best to take under these special circumstances?

He shrank from doing it. It grieved him to the quick to strain her poor broken heart any further. She had suffered so much: why rake it all up again? And even as he thought all

these things, he knew each moment with profounder certainty than ever that he loved Elsie. There is nothing on earth to excite a man's love for a beautiful woman like being compelled to take tender care for that woman's happiness—having a gentle solicitude for her most sacred feelings thrust upon one by circumstances as an absolute necessity.—Still, Warren Relf was above all things honest and trustworthy. Not to send that advertisement straight to Elsie, even at the risk of hurting her own feelings, would constitute in some sort, he felt, a breach of confidence, a constructive falsehood, or at the very best a *suppressio veri*; and Warren Relf was too utterly and transparently truthful to allow for a moment any paltering with essential verities.—He sighed a sigh of profound regret as he took his penknife with lingering hesitation from his waistcoat pocket. But he boldly cut out the advertisement from the Agony Column, none the less, thereby defacing the first page of the *Times*, and rendering himself liable to the censure of the committee for wanton injury to the club property; after the perpetration of which heinous offence he walked gravely and soberly into the adjoining writing-room and sat down to indite a hasty note intended for his sister at the *Hôtel du Louvre*:

MY DEAR EDIE—Just after you left, I caught sight of enclosed advertisement in the second column of this morning's *Times*. Show it to Her. I can't bear to send it—I can't bear to cause her any further trouble or embarrassment of any sort after all she has suffered; and yet—it would be wrong, I feel, to conceal it from her. If she takes my advice, she will not answer it. Better let things remain as they are. To write one line would be to upset all. For heaven's sake, don't show Her this letter.—With love to you both and kind regards to Her, Your affectionate brother,
W. R.

He addressed the letter, 'Miss Relf, *Hôtel du Louvre*, Marseilles,' and went over with it to the box on the mantel-shelf, where Hugh Massinger's letter was already lying.

When Edie Relf received that letter next evening at the hotel in the Rue Cannebière, she looked at it once and glanced over at Elsie. She looked at it twice and glanced over at Elsie. She looked at it a third time—and then, with a woman's sudden resolve, she did exactly what Warren himself had told her not to do—she handed it across the table to Elsie.

Hugh's plot trembled indeed in the balance that moment; for if only Elsie wrote to Winifred, ignoring of course his last forged letter, then lying on the hall table at Whitestrand, all would have been up with him. His lie would have come home to him straight as a lie. The two letters would in all probability not have coincided. Winifred would have known him from that day forth for just what he was—a liar—and a forger.

And yet if, by that simple and natural coincidence, Elsie had sent a letter from Marseilles merely assuring Winifred of her safety and answering the advertisement, it would have fallen in completely with Hugh's plot, and rendered Winifred's assurance doubly certain. Elsie had sailed to Australia by way of Marseilles, then. In a novel, that coincidence would surely have

occurred. In real life, it might easily have done so, but as a matter of fact it didn't; for Elsie read the letter slowly first, and then the advertisement.

'Poor fellow!' she said as she passed the letter back again to Edie. 'It was very kind of him; and he did quite right.—I think I shall take his advice, after all.—It's terribly difficult to know what one ought to do. But I don't think I shall write to Winifred.'

Not for herself. She could bear the exposure, if it was to save Winifred. But for Winifred's sake, for poor dear Winifred's. She couldn't deprive her of her new lover.

Ought she to let Winifred marry him? What trouble might not yet be in store for Winifred?—No, no. Hugh would surely be kinder to *her*. He had sacrificed one loving heart for her sake; he was not likely now to break another.

How little we all can judge for the best. It would have been better for Elsie and better for Winifred, if Elsie had done as Warren Relf did, and not as he said—if she had written the truth, and the whole truth at once to Winifred, allowing her to be her own judge in the matter. But Elsie had not the heart to crush Winifred's dream; and very naturally. No one can blame a woman for refusing to act with more than human devotion and foresight.

Hugh Massinger had left the headquarters of Bohemia for twenty minutes at the exact moment when Warren Relf entered the Cheyne Row Club. He had gone to telegraph his respectful condolences to Winifred and Mrs Meysey at Invertnar Castle, on their sad loss, with conventional politeness. When he came back, he found, to his surprise, the copy of the *Times* still lying open on the smoking-room table; but Winifred's advertisement was cut clean out of the Agony Column with a sharp penknife. In a moment he said to himself, aghast: 'Some enemy hath done this thing.' It must have been Relf! Nobody else in the club knew anything. Such espionage was intolerable, unendurable, not to be permitted. For three days he had been trembling and chafing at the horrid fact that Relf knew all and might denounce and ruin him. That alone was bad enough. But that Relf should be plotting and intriguing against him! That Relf should use his sinister knowledge for some evil end! That Relf should go spying and eavesdropping and squirming about like a common detective! The idea was fairly past endurance. Among gentlemen such things were not to be permitted. Hugh Massinger was prepared not to permit them.

He passed a day and night of inexpressible annoyance. This situation was getting too much for him. He was fighting in the dark: he didn't understand Warren Relf's silence. If the fellow meant to crush him, for what was he waiting? Hugh could not hold all the threads in his mind together. He felt as though Warren Relf was going to make, not only the Cheyne Row Club, but all London altogether too hot for him. To have drowned Elsie, to be jilted by Winifred, and to be baffled after all by that creature Relf—this, this was the hideous and ignominious future he saw looming now visibly before him!

It was with a heavy heart that next evening at seven he dropped into the club dining-room. Would Relf be there? he wondered silently. And

if so, what course would Relf adopt towards him? Yes, Relf *was* there, at a corner table, as good luck would have it, with his back turned to him safely as he entered; and that fellow Potts, the other mudbank artist—they hung their wretched daubs of flat Suffolk seaboard side by side fraternally on the walls of the Institute—was dining with him and concocting mischief, no doubt, for the house of Massinger. Hugh half determined to turn and flee: then all that was manly and genuine within him revolted at once against that last disgrace. He would not run from this creature Relf. He would not be turned out of his own club—he was a member of the Committee and a founder of the society. He would face it out and dine in spite of him.

But not before the fellow's very eyes; that was more than in his present perturbed condition Hugh Massinger could manage to stand. He skulked quietly round, unseen by Relf, into the side alcove—a recess cut off by an arched doorway—where he gave his order in a very low voice to Martin, the obsequious waiter. Martin was surprised at so much reserve. Mr Massinger, he was generally the very freest and loudest-spoken gentleman in the whole houseful of 'em. He always talked, he did, as if the club and the kitchen and the servants all belonged to him.

From the alcove, by a special interposition of fate, Hugh could hear distinctly what Relf was saying. Strange—incredible—a singular stroke of luck: he had indeed caught the man in the very act and moment of conspiring.—They were talking of Elsie! Their conversation came to him distinct, though low. Unnatural excitement had quickened his senses to a strange degree. He heard it all—every sound—every syllable.

'Then you promise, Frank, on your word of honour as a gentleman, you'll never breathe a word of this or of any part of Miss Challoner's affair to anybody anywhere?'

'My dear boy, I promise, that's enough.—I see the necessity as well as you do.—So you've actually got the letter, have you?'

'I've got the letter. If you like, I'll read it to you. It's here in my pocket. I have to restore it by the time Mr Meysey returns to-morrow.'

Mr Meysey! Restore it! Then, for all his plotting, Relf didn't know that Mr Meysey was dead, and that his funeral was fixed to take place at Whitestrand on Monday or Tuesday!

There was a short pause. *What* letter? he wondered. Then Relf began reading in a low tone: 'My darling Winifred, I can hardly make up my mind to write you this letter; and yet I must: I can no longer avoid it.'

Great heavens, it was his own forged letter to Winifred! How on earth had it ever come into Relf's possession!

Plot, plot—plot and counterplot! Dirty, underhand, hole-and-corner spy-business! Relf had wheedled it out of the Meyseys somehow, to help him to track down and confront his enemy! Or else he had suborned one of the Whitestrand servants to steal or copy their Master's correspondence!

He heard it through to the last word, 'Ever your affectionate but heart-broken ELSIE.'

What were they going to say next?—Nothing. Potts just drew a long breath of surprise, and

then whistled shortly and curiously. 'The man's a blackguard, to have broken the poor girl's heart,' he observed at last, 'let alone this. He's a blackguard, Relf.—I'm very sorry for her.—And what's become of Miss Challoner now, if it isn't indiscreet to ask the question?'

'Well, Potts, I've only taken any other man into my confidence at all in this matter, because you knew more than half already, and it was impossible, without telling you the other half, fully to make you feel the necessity for keeping the strictest silence about it. I'd rather not tell either you or anybody exactly where Miss Challoner's gone now. But at the present moment, if you want to know the precise truth, I've no doubt she's at Marseilles, on her way abroad to a farther destination which I prefer on her account not to mention. More than that it's better not to say. But she wishes it kept a profound secret, and she intends never to return to England.'

As Hugh Massinger heard those words, those reassuring words, a sudden sense of freedom and lightness burst instantly over him in a wild rush of reaction. Aha! aha! poor feeble enemy! Was this all? Then Relf knew really nothing! That mysterious 'Yes' of his was a fraud, a pretence, a mistake, a delusion! He was all wrong, all wrong and in error. Instead of knowing that Elsie was dead—dead and buried in her nameless grave at Orfordness—he fancied she was still alive and in hiding! The man was a wind-bag. To think he should have been terrified—he, Hugh Massinger—by such a mere empty boastful eavesdropper!—Why, Relf, after all, was himself deceived by the forged letters he had so cleverly palmed off upon them. The special information he pretended to possess was only the special information derived from Hugh Massinger's own careful and admirable forgeries. He hugged himself in a perfect transport of delight. The load was lifted as if by magic from his breast. There was nothing on earth for him, after all, to be afraid of!

He saw it all at a glance now.—Relf was in league with the servants at the Meyseys'. Some prying lady's-maid or dishonest flunkey must have sent him the first letter to Winifred, or at least a copy of it: nay, more; he or she must have intercepted the second one, which arrived while Winifred was on her way to Scotland—else how could Relf have heard this last newly fledged fiction about the journey abroad—the stoppage at Marseilles—the determination never to return to England?—And how greedily and eagerly the man swallowed it all—his nasty second-hand servants'-hall information! Hugh positively despised him in his own mind for his ready credulity and his mean duplicity. How glibly he retailed the plausible story, with nods and hints and additions of his own: 'At the present moment, I've no doubt she's at Marseilles, on her way abroad to a farther destination which I prefer on her account not to mention.' What airs and graces and what comic importance the fellow put on, on the strength of his familiarity with this supposed mystery! Any other man with a straightforward mind would have said outright plainly, 'to Australia'; but this pretentious jack-anapes with his stolen information must make up a little mystification all of his own, to give himself importance in the eyes of his greedy gobe-

mouche of a companion. It was too grotesque! too utterly ridiculous! And this was the man of whom he had been so afraid! His own dupe! the ready fool who swallowed at second-hand such idle tattle of the servants' hall, and employed an understrapper or a pretty *soubrette* to open other people's letters for his own information! From that moment forth, Hugh might cordially hate him, Hugh might freely despise him; but he would never, never, never be afraid of him.

One only idea left some slight suspicion of uneasiness on his enlightened mind. He hoped the lady's-maid—that hypothetical lady's-maid—had sent on the forged letter—after reading it—to Winifred. Not that poor Winifred would have time to think much about Elsie at present, in the midst of this sudden and unexpected bereavement: she would be too full of her own dead father, no doubt, to pay any great attention to her governess's misfortunes. But still, one doesn't like one's private letters to be so vulgarly tampered with. And the worst of it was, he could hardly ask her whether she had received the note or not. He could hardly get at the bottom of this low conspiracy. It was his policy now to let sleeping dogs lie. The less said about Elsie the better.

Yet in his heart he despised Warren Relf for his meanness. He might forge himself: nothing low or ungentlemanly or degrading in forgery. Dishonest, if you like; dishonest, not vulgar. But to open other people's letters—pah!—the disgusting smallness and lowness and vulgarity of it! A sort of under-footmanish type of criminality. *Pecca fortiter*, if you will, of course, but don't be a cad and a disgrace to your breeding.

OLD SHIPS.

A FEW months ago the *Victory* was in imminent danger; Nelson's famous fighting ship showed symptoms of senile decay; her time-tried timbers were no longer strong enough to exclude the water that ripples caressingly against her hoary frame. The old ship was launched in 1765, and has therefore withstood the flight of time, the attack of the enemy, and the fury of the elements for more than a century. The necessary repairs have been made, and this revered specimen of an extinct system of naval architecture is good for another hundred years, provided she remain in her present position. The proud privilege of gazing upon the spot where Britannia's hero breathed his last will be transmitted unimpaired to future generations of his admiring countrymen. The sight of such a ship tends to perpetuate the glorious memory of the daring deeds of our forefathers, which have assured to their posterity the stability of our institutions and the supremacy of our flag. What a competition there would be in order to obtain a fragment of her frame if she were to be condemned! The smallest chip would become a treasured heirloom.

The *Sovereign of the Seas*, the first British three-decker, was, as a quaint old writer has it, 'built to the great glory of the English nation, and not

to be paralleled in the whole Christian world.' Her keel was one hundred and twenty-eight feet long, or but one quarter the length of our finest Atlantic steamships. She carried one hundred guns, and measured sixteen hundred and thirty-seven tons burden. It was deemed a happy omen for the king that her tonnage unexpectedly proved to be exactly the same as the year of her launch. Her cost was borne by the ship-money, the most notorious of all the illegal imposts of Charles I. The exaction of this tax led to the deposition and execution of the king, so that the omen was a left-handed one. The good ship saw much service against France and Holland, and was destroyed by fire, at a ripe old age, in 1696, at Chatham, where so many illustrious ships have met their fate.

The *President*, built sixty years ago, lies moored head and stern in the south West India Docks, London. She is a drill-ship for the men of the Royal Naval Reserve; and her inlaid wooden walls, studded with gaping portholes, look strangely out of place among the clipper-built iron and steel vessels of the present era. Half-a-dozen men-of-war that were built at Bombay in the infancy of the present century, and several of equal antiquity built in the home dockyards, are still afloat. Some of them possessed good sailing qualities, having regard to their bulk; but the modern ironclad has driven them from off the seas.

The *Resolute* scoured the Arctic seas in search of Sir John Franklin. She was frozen fast in the middle of a wide waste of ice, and abandoned by her crew. The ice setting outwards from the frigid zone, bore her southward; and after a remarkable drift, she was picked up by an American whaler. The United States government refitted and returned the derelict to Great Britain. She lay uncared for at her moorings in the Medway for several years, and was ultimately taken in dock and pulled to pieces. A suite of furniture was fashioned from her oaken timbers and presented to the President of the Republic. Small pieces of her were smuggled out of the dockyard, and many a wooden article is held dear at Chatham as a relic of the brave old discovery-ship.

The duel between the *Shannon* and the *Chesapeake* (June 1, 1813) forms an interesting page in the history of the struggle between the United States and Great Britain from 1812 to 1815. The Americans had crowded the *Chesapeake* with inexperienced landmen, and had made ready, it is said, a feast on shore for the crew on their return flushed with victory. The unexpected happened as usual: the American frigate became the prize of the ship of the mother-country. The *Shannon* also was broken up at Chatham, and parts of her hull were sold at a premium.

Sir Francis Drake's tiny ship, the *Golden Hind*, at a still more remote period came to a similar end at Deptford. A chair made out of her timbers is treasured by the university authorities

at Oxford. In reference to this circumstance, Cowley has left the following felicitous epigram:

Drake and his ship could not have wished from fate
A happier station or more blest estate;
For lo! a seat of endless rest is given
To her in Oxford, and to him in heaven.

Our country could better have borne the destruction of a more costly vessel. The vandals might at least have left us a well-constructed model of her.

Would that Captain Cook's *Endeavour* could be rehabilitated! The great circumnavigator had mastered the mysteries of his profession as a seaman in a collier brig. He chose the *Endeavour*, a ship of the collier class, to place a girdle about the round world, in preference to a frigate placed at his disposal. Several of his scientific instruments are preserved to this day; but the good ship, where is she?

The French sent out two ships, the *Astrolabe* and the *Boussole*, soon after the return of Cook's successful expedition. They were lost with all hands among the rocky islets of the Pacific. The place at which they were wrecked was discovered, years afterwards, by an English captain. The French were unable to recover the vessels, but erected a Column in Paris to the memory of the unfortunate crews, and decorated it with such parts of the ships' outfits as they were able to wrest from Neptune.

The *Vitoria* made the first voyage round the world. Her commander was richly recompensed; and a terrestrial globe which bore the words 'Primus circumdedit me' was assigned to him as armorial bearings. The *Vitoria* was drawn up on to the dry land and preserved for many years. She was probably not so well looked after as our *Victory*, and no part of her has escaped destruction.

Once a year the red banner of St Mark with its golden lion waved over the heads of the doge of Venice and the principal personages of the haughty republic who thronged the decks of the *Bucentaur*, a two-decked highly ornamented gondola. Attended by an immense cortège of gondolas, she would leave the port and her consorts far behind. The doge, clothed in golden robes, would elevate his hands heavenwards and cast a sapphire ring into the Adriatic, saying: 'O sea! we espouse thee as a symbol of veritable and unending sovereignty.' Republic and ship have both passed away. A mast of the *Bucentaur* is preserved by the authorities at Venice. The gondoliers have some small portions of her: these are bequeathed to their heirs, and serve to recall from the dim distance the former importance of their fatherland and the days of its glory and liberty.

Some remarkable worn-out war-vessels have been sold to private firms, and broken up in order to get out the valuable copper bolts with which they are fastened together. Huge figure-heads of the *Queen* and *Goliath* are affixed to the entrance of a ship-knacker's yard adjacent to Vauxhall Bridge, London. They are curiosities in their way and afford food for reflection.

If the old warships could choose, they would probably prefer death to dishonour. There is a lower depth of degradation than to be dismantled and dismembered. Not long since we had occa-

sion to visit officially the Norwegian ships *Rota*, *Freia*, and *Galathea*. They had arrived with timber from American ports. Much to our surprise, we discovered that they were superannuated Danish men-of-war, built in 1822, 1824, and 1832 respectively. Sold out of the service, they had been bought by Norwegian merchants. Shorn of their high estate, there was, however, a massiveness and a dignity about their hulls that contrasted painfully with the poorness of their top-hammer and the scantiness of their crews.

A veteran warship appeals with fervency to the patriotic emotions of the veriest tyro in things nautical. She is an inspiration to a sea-loving youth; the picturesque embodiment of his day-dreams lies before him. The ships of Marryat, of Chamier, and of Armstrong have assumed a substantial form, and he seems to hear vividly the shrill scream of the pipe and the tramp of the blue-jackets along the deck. Will the sullen, sombre ironclads of to-day evoke similar enthusiasm? The old order passeth away, and the writer of nautical novels will find it hard to break out into raptures over the plated leviathans. The engineer has it all his own way now.

A halo of glory surrounds our old warships; but it is far otherwise with the vessels of the mercantile marine. The average life of a merchant-ship is from ten to fifteen years. Many survive but a few years; a few live to a painful old age. No matter how favourable the auspices may be when the merchant vessel glides down the ways, her hardships increase with old age, and her end is pitiable. Her early days are passed under sunny skies. Laden with fragrant teas and shimmering silks from far Cathay, she scuds before the gale or climbs the hill of impeding waters. Age grows on her apace, and she is sold at last to the Norwegians, those buyers of unseaworthy British ships. Then she may be seen struggling along with a cargo of timber, which alone she is fit to carry.

The *Betsy Caius* brought over William of Orange to this country in 1688, and was cast away in 1827—one hundred and thirty-nine years later. This historical ship, that helped to change a dynasty, was over one hundred and fifty years old when she ceased her combat with the winds and waves. The *Brothers*, a wooden brig, built at Maryport in 1786, is even now ploughing the waters of the North Sea. We noticed a good model of her in South Kensington Museum. She is one of those box-like craft that sailors say are built by the mile and cut off as they are wanted. The *Robert*, a wooden barquentine built at Barnstaple just ten years after H.M.S. *Victory*, is in active service. The *Truelove* of London, an American-built barque of 1764, would appear to be the oldest trader in this country, or indeed in the whole world. The *Goodwill*, built at Sunderland in 1785, the *Eliza*, built at Whitehaven in 1792, and the *Cognac Packet*, built at Bursledon in the same year, complete the tale of British ships remaining to us from last century. The Norwegians possess three vessels that have been employed actively for one hundred years. We have made an exhaustive analysis, and find there are two hundred and ninety vessels afloat that were launched before the accession of Her Majesty to the throne.

Some of the more modern merchant-ships become handmaidens to the steamships that are

fast taking their place in the carrying-trade. They have already supplanted them in the passenger traffic. Several famous vessels are anchored abroad as coal-hulks. The *Marlborough*, one of the old-fashioned East Indiamen, formerly commanded by Captain H. Toynbee, of the Meteorological Office, is moored at Gibraltar. How times have changed since she walked the waters like a thing of life, her white wings glistening in the sun! How many thousands of our troops she has borne in comfort and safety to our conquests in India. How many leagues of azure waters she has traversed in her voyages around the Cape of Storms! Her hands would man half-a-dozen equal-sized iron ships of the present day! Competition has not been an unmixt good to the British seaman nor to the shipowner. The *La Hogue* lies anchored off Funchal, Madeira. She was originally one of Duncan Dunbar's celebrated colonial passenger-ships. Her name is as familiar in Australia as a household word. When on board of her three years ago, we were informed by her captain that people would come from the interior to look once again on the good ship that brought them safely through the region of icebergs to the land of gold. How many well-to-do colonists have restlessly paced her deck without a penny in their pockets! What castles in the air were built on board of her by the emigrants whose children are the aristocracy of the rising cities! There are other ships of this kind stationed at Diego Garcia, Zanzibar, and elsewhere.

The competition between the tea-clippers of twenty years back awakened an intense excitement among the mercantile public. The British vessels in the end ousted the American clippers from the tea-trade, of which they enjoyed the monopoly; and other causes have conspired to destroy the supremacy of America as an ocean-carrier. Much money changed hands on the result of the ocean races. The *John Bertram* and the *Nightingale*, two of the famous American tea-clippers, were sold to the Norwegians. The former foundered in 1885 while bound to England with a cargo of petroleum from the American wells. We visited these two old vessels in their adversity, and dwelt with sadness on the days when they raced home against the London ship *Challenger* from Shanghai. Stakes were laid to the extent of twenty thousand dollars, which were won by the backers of the British ship. The *Thermopylae*, one of the most famous of the clippers, looks as fresh as ever. Her owners, George Thompson & Co. of Aberdeen, possess the finest fleet of ships that sail the seas; and the absence of loss of life in their extensive trade is phenomenal. This vessel sailed from London to Melbourne in sixty days; from Newcastle, New South Wales, to Shanghai, in twenty-eight days; and from China to England in ninety-one days—an unprecedented voyage, truly. The *Jerusalem*, one of this firm's old ships, has lately been sold to the Norwegians. What will become of the famous *Thermopylae*? She is worthy of a better fate.

Old ships serve as finger-posts along the path of progress. An interesting collection of models was exhibited by the Shipwrights' Company in 1882. There was one of the Viking's ship brought to light in 1880, having been embedded during one thousand years on the Scandinavian shore; and

another of the *Sovereign of the Seas*, previously referred to; and close by were others of the most advanced forms of steamship. The most superficial observer could not but be impressed with the rapid development of the art of the naval constructor.

MISS BARKLE'S LEGACY.

CHAPTER II.—A MEETING ON THE SANDS.

BEFORE that mysterious advertisement was explained, Midport society remained in the tortures of ungratified curiosity for five long days, for Miss Barkle had been summoned to London by telegram almost immediately after its appearance. During her absence, nothing was heard to enlighten her expectant friends; and when it became known that she was once more back at the cottage, that humble dwelling sustained something like a siege for the whole of the subsequent day.

The story Miss Barkle had to tell spread like wildfire, and received the usual variations from the gossips who passed the romantic tale from mouth to mouth, according to the ingenuity or veracity of the teller. We, however, can go straight to the fountain-head, and learn the actual facts, as Messrs Lambton and Warder told them to Miss Barkle. They had the honour of acting as executors to the late Mr George Penbury, and as such, wished to inform her that their late client had bequeathed to her the sum of ten thousand pounds, provided she was unmarried at the time of the testator's decease. Miss Barkle, as previously directed by Mr Brawn, had entered the office of the executors with her proofs of identity in her hand; and the matter so far as she could advance it was settled. But there was another phase of it to be considered. Mr Penbury had left a widow, a lady he had married only three years before his death; and Mrs Penbury had displayed so much resentment when the contents of her husband's will were made known to her, that Messrs Lambton and Warder felt it their duty to warn Miss Barkle that the bequest might form the subject of an action at law. They recommended her to let the business stand over for the present; the widow's feelings were most natural; but they had no doubt that a satisfactory settlement would be arrived at out of court if the legatee would bide her time.

Miss Barkle sat mutely at the lawyer's table, whilst he harped upon the possibility of a lawsuit and the hopes of an amicable arrangement to deaf ears. The name of her benefactor had awakened a train of thought scarcely pleasant to her now. Yes, she had known George Penbury sixteen years before; of her many admirers, he had been the most sincere and the least appreciated. She had laughed at him when he laid his wealth at her feet, for the Miss Barkle of twenty-one was a giddy ambitious girl, whose head had been turned by flattery. He left her without another word after his rejection, and they never met again. Long since she had totally forgotten him; his marriage had never come to her ears: his memory for her, however, had been more enduring, and she felt that his widow had some reason on her side for the hostile attitude she was expected to assume.

So Miss Barkle left the lawyer's office and made her way back to Midport, where her neighbours eagerly awaited her return. Of course they did not hear all the details of the case, but the bare reality was sufficient to raise her to the pedestal of a heroine in the eyes of her friends, and these dispersed their several ways, enchanted at having in their midst the central figure of so charming a little romance. We are certain of sympathy when fortune is kind to us, and the old ladies of Midport insisted on extolling Miss Barkle as the constant maid who had remained faithful to a lover unworthy of her regard. His bequest was pointed to as testimony of his remorse, and desire to do scant and tardy justice to a deeply injured woman, who deserved much more than she was to receive.

Mr Brawn was absent from Midport when she returned; he had been called away by his sister during her stay in London, and was not expected back for some time. He had not even left an address behind him, so Miss Barkle had to curb her impatience to claim his aid in meeting any steps Mrs Penbury might take towards disputing the clause in her husband's will. Although she was eager to do this, it is due to her to say that she appreciated the view Mrs Penbury might be expected to take of the matter, and purposed, if necessary, to make her aware of the extent of her acquaintance with her late husband. She had no wish to come in contact with the widow herself; but Mr Brawn should inform her how long it was since she had known the dead man, and how completely she had lost sight of him. It might not do much to pre-dispose Mrs Penbury in her favour; but it could do no harm to place that lady in possession of facts which she perhaps had no knowledge of, to the exclusion of theories which she might otherwise form for herself.

The cottage was now a favourite afternoon resort of the friends who rallied round Miss Barkle on her access to fortune. They had of course learned that there was the possibility of Mrs Penbury objecting; but the general consensus of opinion, led by Captain Mulbane, was favourable to the chance of the legacy being paid without serious opposition. Messrs Lambton and Warder were to write and inform her as soon as the widow made known to them the course she proposed to adopt; and until that decision arrived, Miss Barkle could not feel that the money was absolutely secure. If her friends did nothing else, they brought comfort to her anxious mind; it could not be very long before the business was settled one way or the other; and with Annie Carston living at the cottage and her numerous callers, she had little leisure to brood over it by herself.

It was a fine summer evening a few days after her return from London, when Miss Barkle, finding herself alone, was tempted to take a solitary walk along the beach. Armed with a novel, she set out along the stretch of sand that led far from the pier with its crowds of children and idlers.

Her thoughts, as they had often been since her late windfall, were occupied with Mr Brawn and that gentleman's 'intentions.' Would this money bring him any nearer her? She did him the justice to say to herself that it would have no

influence one way or the other; but still she could not altogether crush out a tiny lurking hope that it *might* further her wishes. She sat down and drew figures on the sand with her stick, whilst she surveyed the events of the past week in a dreamy way, as though they had happened to some one else, and had had no effect upon her prospects whatever. What a perfect evening it was: not a breath of wind, and not a cloud in the blue vault above. Her eyes wandered over the rippling sea to the distant fleet of fishing-boats, whose white sails flashed like wings in the setting sun.

She rose to continue her walk, but finding a little pebble in her shoe, sat down again, and having shaken it out, remained with it in her hand, thinking of the time when she was a little girl paddling on the beach with bare feet. An only child, she had been indulged in every possible way, and she laughed as the escapades of her girlhood rose to her recollection. If she could but live her life over again and once more be a child. The seaside was different then! A clear shallow pool lay before her, and some mischievous sprite suggested that she might enjoy a delicious little paddle there now. Miss Barkle blushed at the very thought at first; but presently took a careful look all round. No one was in sight; and so, smiling at her own childishness, she laid aside shoes and stockings and stepped warily across the sand to the water's edge. How the old women would chatter if they heard of this.—But how? Eh? Wasn't that sound suspiciously like a man whistling?—and no great distance from her, either?

She looked round and turned pale, for not a hundred yards away she discerned the portly form of Captain Mulbane, whose approach had been hitherto concealed by the rocks! Throwing an agonised glance in the direction of her shoes, she saw that the gentleman must pass close by the place where she had left them. Instant action was her only hope, and she made a dash to recover her property before he came up. In her blind haste she missed the spot, and then to her horror found she was too late. He had recognised her, of course; but a kindly ledge of rock concealed her feet; and as the captain came round it to greet her she sank down on the sand overwhelmed with confusion, smiling faintly. Captain Mulbane, of all men! If he knew it, all Midport would know it; and poor Miss Barkle shrank from the playful badinage she might expect from her friends. Anything would be preferable to discovery; she would sit there all night, if she died of cramp, rather than take him into her confidence. He had detected nothing yet, for he sat down, and in his usual easy way prepared for a chat. The opportunity seemed to him favourable for a little quiet love-making. His admiration for the lady had been stimulated by her reported good fortune; so he made himself as comfortable as a fifteen-stone man can on a seat of hard sand, and gazing amorously at Miss Barkle, began operations with a heavy sigh.

'It's a beautiful evening, Miss Barkle,' he observed with some lack of originality.

'Very fine,' replied the lady, who was relieved to find her companion's eyes fixed upon her face. 'If he only does that, I may get rid of him without being found out,' she thought.

A long pause. Miss Barkle was not going by conversation to encourage him, and the captain was racking his brains for something to say. He wanted to make a beginning, but how to do it he did not know.

'Ain't you afraid of cold, sitting out of an evening, Miss Barkle?' How utterly unable he felt to soar above stupid commonplaces to-night. He couldn't understand it, for he had plenty to say to her as a rule.

'O no. I'm very fond of spending an hour like this,' she said.—Like this! Heaven forgive the little fib!

Another pause, whilst Miss Barkle cast stealthy looks around for those shoes, and thought in despair that the interview might last for hours. The captain was thinking hard, and an idea struck him suddenly: he would begin with another love affair which all Midport was just noticing for the first time, and then work round to his own feelings from that.

'Brawen's been paying your friend Annie Carston a good deal of attention lately,' he said.

'That child!' said Miss Barkle. 'I don't think Mr Brawen is the man to be attracted by her pretty face, though she is as good a girl as I know.'

'You don't think there's anything in it, then?'

'Nothing serious, I imagine,' she replied thoughtfully. 'Annie is with me at the cottage now, and I should have heard, had there really been anything between them.'

'Then, if he means nothing, he's got no business to hang about after her as he does,' said the captain indignantly. 'It isn't fair to the girl.'

Miss Barkle forgot her unpleasant situation and pricked up her ears. This was something new. It was odd she had never heard a whisper of it before.

'I don't know that he does hang about after her, as you express it, Captain Mulbane,' she said.

'Then will you tell me what on earth takes him to your house three or four times a week, Miss Barkle?' he asked vehemently. He really meant no disparagement to her herself, but that she might be the attraction never occurred to him.

The lady longed to say, 'Miss Barkle,' but couldn't well do that, so shook her head with a slight but knowing smile as she murmured 'time would show.'

Captain Mulbane saw the smile, and a thrill of jealousy pierced his soul. Were the Midport gossips wrong? (They were more often so than not.) Was it possible that that little lawyer fellow was also a worshipper of the lady before him? That is not love which sees not in every fellow-man a possible rival. Our nautical friend was an observant individual, but he could not recall anything which would lend colour to the belief that Miss Barkle was John Brawen's idol. Still, she seemed to think she was. The captain was nonplussed, and stared blankly before him, till the lady, fearful of discovery, hastened to attract his attention.

'People might ask what brings you to my house, Captain Mulbane,' she said with unusual sweetness. Oh, if he would only go! She was growing dreadfully stiff!

Her tone gave him new heart. Surely this was

the chance he wanted, and he turned over half-a-dozen 'forms of declaration' in his mind as he struggled into a more suitable position in which to make one. A small cleft rock separated him from the object of his affections, and on this he rested his elbow 'whilst he feasted his yearning eyes, and began with impressive tenderness. 'Lina,' he said. The lady looked up quickly, and the captain's arm slipped into the cleft rock; he glanced down as he withdrew it, and his gaze remained rooted where it fell. Slowly and perplexedly, he drew out something, and raising his eyes, met those of Miss Barkle, who sat petrified. There was an awful pause for a minute, and she hid her face in her hands, whispering almost in tears: 'They're mine.'

Captain Mulbane was dumfounded, and for a few seconds he sat gaping awkwardly. It was an embarrassing check for any one to receive when he was on the very verge of an ardent avowal of love. He collected himself, and wisely decided on instant flight. He was deeply disappointed at their tête-à-tête being brought to so abrupt and singular a close, but could not help seeing that his only policy now was to cut it short at once.

'I'll say good-evening, if you will excuse me, Miss Barkle,' he said; 'I'm in a hurry to go to the club.'

He had not taken his eyes off those little shoes since he first discovered them, and hardly knew what he was saying to cover his retreat; but the lady gladly saw him turn away, and watched him out of sight with mingled feelings of relief and dismay. She prepared for her walk home in a very downcast frame of mind. Captain Mulbane's love of repeating such tales was, she well knew, so great that even his regard for her might not suffice to keep him silent, and she wondered how long it would be before the story came round to her, and what shape it would wear when it did come. He had been on the point of proposing to her, when his arm slipped and he made the discovery. Oddly enough, that phase of the meeting had been almost forgotten until this moment, when she seized upon it joyfully as a point that justified her in believing her garrulous friend would say nothing about it. She made up her mind to be particularly engaging in her manner to him, by way of insuring his continued silence, and then bent her thoughts on his remarks about Mr Brawen and Annie Carston. They had met frequently at her house, it was true, and were on very good terms, but nothing more, so far as she could judge. Still, there might be something in it, though Captain Mulbane was such an old gossip. She shrank from speaking to Annie on the subject, after the chat they had had on the evening the young lady came and begged the hospitality of the cottage; she had told her confidante then that she was sure Mr Brawen would declare himself before long, and now—hardly a week afterwards—she hears that the gentleman has been observed to pay marked attention to the confidante herself! She felt that she stood in rather a false position towards her friend, and entered her house harassed with jealous doubts. If she had been anxious for Mr Brawen's return before, she was doubly anxious now; his presence and nothing else could put matters right.

Captain Mulbane meantime was on his way to his own lodgings, bewildered and piqued. He

had seen Miss Barkle run up the beach, but had not noticed how she had been amusing herself; never suspected it till the look she gave when he used her Christian name startled him into making the slip which resulted in that unlucky find. No wonder she had been silent and constrained, no wonder he had found it difficult to talk to her. Why, from the moment he sat down she must have been praying silently for him to take himself off; and he, not only had he kept her in suspense for a good half-hour—quite enough to disgust her with him—but, like a blundering jackass, he must select that opportunity of all others to try and propose to her!

'Nice hash I've made of it,' said the gallant officer to himself. 'I've put my foot in it often before; but if ever I executed a worse manœuvre than this, I'm—I'm scuttled,' he concluded, casting about for an expression strong enough to suit his frame of mind.

He reached his lodgings, and taking an arm-chair, began to consider the case in earnest over a pipe, for he felt the necessity of 'repairing damages' at once. It was a difficult point, and the captain knitted his brows and smoked vigorously as he concentrated his mind upon it. He couldn't go up to the cottage and apologise for taking so innocent a share in the *contretemps*. He had been in no way to blame, and it wouldn't help him to assume that he had. At the same time he wished to avert the unpleasantness that might attend their next meeting if it took place before the freshness had worn off the incident.

'It's just as unlucky a business as ever I had a hand in,' ruminated the captain; 'now, particularly, when that money has just come to her and the lawyer fellow is hanging about. Most unfortunate! However, she isn't likely to tell any one but the little Carston girl, perhaps; and William Mulbane won't be such a fool as to mention it either. No fear of it.'

So the captain came to a conclusion that would have cheered Miss Barkle's heart had she known of it. She had said nothing about her afternoon's adventure to Annie Carston, and that sprightly young lady was at a loss to account for her friend's dejection. She took her own troubles very philosophically, and her one anxiety now was to know when John Brawen would return. A letter was awaiting her at home, but her step-mother had refused to give it up until Annie returned to the house. As the writer would be back before long, she preferred to go without it rather than pay such a price. It would be easy to explain her silence, and she waited patiently for his reappearance.

The morning that succeeded the little episode on the beach found Miss Barkle in high spirits. Mr Brawen had written to beg for her assistance in finding a house suitable for his sister and himself; he was sorry to trouble her at a time when she had doubtless much to do herself, but he had not even looked into his sister's affairs yet, and hoped he might count upon her kindness. Miss Barkle was enchanted with this mark of confidence, which she thought capable of bearing a double signification, and showed the letter to Annie with a complacent smile.

'You must come and help me,' she said; 'I couldn't undertake the responsibility alone.'

Annie was quite willing to assist, and the two

started on their house-hunting expedition with thoughts curiously similar.

'It's his nice way of consulting me about the house,' mused Miss Barkle. 'I suppose we should have to live in Midport, since John has his business here; but I'd rather settle near town if I could choose.'

'It's jolly to have a voice in taking a house one has an interest in,' thought Annie Carston. 'I hope the sister won't be with us always, though; and I wish we could live anywhere but in Midport.'

They were careful, however, to conceal their ideas from each other; but when the actual business was in hand, and they were looking through the furnished villa they selected to go over first, the elder lady was within an ace of betraying herself a dozen times.

'That little room will just suit you, Annie, when you come—I mean if you go—that is, if Mr Brawen's sister asks you to visit her.' Miss Barkle had nearly tripped into saying, 'when you come to stay with us,' and wisely resolved to try and regard the matter for the present as one in which she had no personal concern; but constant watchfulness was essential to succeed in this.

They satisfied themselves at length, and arrangements were made for 'Lansdale House' to be cleaned and got ready for the occupants. A telegram to Mr Brawen to announce what had been done was crossed by another from that gentleman saying that he had left his sister's concerns in the hands of her own solicitors and would be down with her on the following day.

'It's lucky we didn't lose an hour, Annie,' said Miss Barkle that evening; 'it will take us all our time to get the place presentable before they come to-morrow.'

They arranged to meet the travellers at the house to show them anything that might be necessary. They should then leave Mr Brawen alone with his sister, who would not care about seeing strangers yet.

Their labours were scarcely over the next morning, when John Brawen and his sister arrived, and were received at the door by the two ladies.

'Miss Barkle has kindly put the house in order,' said he to the widow, who entered beside him.—'Let me introduce my sister to you, Miss Barkle—Mrs Penbury.'

MUNGO.

My friends often ask me how it is that I can show so much attachment towards Mungo, a hideous little dog who is my companion in my walks, and trots at my heels just as if there was nobody and nothing else he cared for in the world. From an æsthetic point of view, I confess Mungo is a complete failure; and from the same standpoint I might be regarded as a person of deplorably bad taste. Picture to yourself all possible points of beauty in a dog, imagine exactly the opposite in every particular, and there you have Mungo. His hairless body, with its hideous patches in various colours, and his ill-shaped limbs, make him look like one of those creatures that the victims of delirium tremens see in their dreams. But my attachment towards Mungo is too deeply

rooted to be disturbed by his unattractive appearance. It is to him that I once owed my life, and so long as he lives I will look after him. This is how it happened.

Towards the close of my term of service in India, Mungo—a native mongrel of some sort or other—used to prowl about the barracks picking up bits here and there, although kicked and cuffed alike by officers and men. As, however, he seemed to be half-starved, I used to throw him some bones and scraps of food, so that after a time he began to get into quite a plump condition. For these little attentions he showed his gratitude by attaching himself to me and following me about as a well-bred English dog would do. At that time we used to go out once a month or so, on shooting expeditions into the jungle, and it was on one of these occasions that the event occurred which has made so indelible an impression on my memory. I was not in very cheerful spirits, for an incident of the previous night had somewhat troubled me. The sergeant's wife, one of the smartest little women in camp, had been left alone with her little boy, ten years old, her husband having been unexpectedly called away on duty. Soon after dusk they were horrified to see the head of a monstrous tiger come through a hole in the veranda, the eyes being fixed on them. Almost beside themselves with terror, they scarcely knew what to do; but a thought suddenly struck the mother. Picking up a tray, she placed it against the hole, thus compelling the monster to withdraw his head. But the tray had to be held there, in case the tiger should return; and mother and son relieved one another in standing there throughout the whole night, afraid to open the door to give an alarm, lest the tiger should be prowling about in search of another entrance to the room.

My thoughts were so fixed on this incident as we walked along through the jungle that I failed to keep up with the other members of the party, who had got on some distance ahead; when suddenly I heard a rustle in the underwood, and almost at the same moment an enormous tiger presented himself and prepared to spring upon me. I had never seen a more magnificent beast, and I could not help admiring him, notwithstanding the danger of my position. But there was no time to be lost. I immediately presented my rifle and fired. As ill-luck would have it, neither shot struck; and in another second the tiger was on me and had thrown me down, his claws buried in my left shoulder. I had no particular sensation of fear, and I remember thinking quite calmly as I lay on the ground, the tiger's hot breath coming against my face, 'It's all up with me now.' But at that moment my faithful little Mungo came to the rescue: he bit the tiger's tail so severely, that the beast immediately released his hold and turned round to seize its new adversary. But Mungo, as sharp and wary as he was plucky, was off in the tall grass in an instant. The tiger followed; but the dog had the advantage over him, as it could run through the grass and under the brushwood at a pace which the other could not keep up with. In fact it was almost comical to see how the great creature bounded about in its useless chase after the dog. But I knew that the tiger, disappointed

of seizing Mungo, would soon be back again to attack his master; so I reloaded my gun and stood awaiting his return. In a short time he was before me once more; and again I levelled my gun as well as I could, considering the pain in my left shoulder. The first shot missed; but the second struck the tiger in the shoulder, crippled him, and made him roll about in agony. Reloading as rapidly as possible, I went nearer to him, aimed very deliberately, and this time gave him his quietus. Scarcely had I done so before Mungo came bounding up to me, looking into my face, and whining as if with joy at seeing me safe. How I patted and fondled him, and how utterly unconscious I was then of his extreme ugliness, can easily be imagined.

I examined the tiger's tail, saw the marks left on it by Mungo's severe bite, and then returned to camp to get the assistance of some of my comrades in removing the animal's skin as a trophy of my adventure, and as a practical proof that I was entitled to the reward which was allowed us for every tiger we killed.

ECONOMICS OF RAILWAYS.

RAILWAYS are so familiar in present-day thoughts and habits, that few of us perhaps realise what an immense economic force they have become, not only in our own country but also in the world at large; and yet only sixty odd years have elapsed since that now historic incident, the construction of the Stockton and Darlington Railway. The Act of Parliament authorising it was passed in 1821, and the line was opened in 1825. But the Stockton and Darlington was not the first railway, nor does its first Act make any mention of steam-engines; and in 1823 it had to apply for another Act for power to use locomotives. It was in this year that the first Act of Parliament was passed authorising the conveyance of passengers on a public railway by means of locomotive engines. But really the first Railway Bill was passed twenty-two years previously, namely, in 1801, for the construction of a line from Wandsworth to Croydon. In 1803 another line was authorised from Croydon to Reigate; and in 1804 another from Swansea to Oystermouth. These were the pioneer lines; and there were several others sanctioned by Parliament before the Stockton and Darlington scheme was submitted in its first form. But although there was no mention of steam-power in these schemes, the locomotive had prior existence, for Symington's locomotive was drawing barges along the Forth and Clyde Canal in 1785, although Trevethick's engine—tried first in 1804—was three years later than the first public railway. Of course everybody knows that it was the success of Stephenson's locomotive which led to its adoption on the Stockton and Darlington Railway, and of what resulted from that bold experiment; but everybody does not know the other little facts given above.

We do not propose to tell again the oft-told tale of the Stockton and Darlington and Chatmoss railways; but we propose to give some interesting matter illustrative of what we mentioned at the outset—the great economic force which has

developed in railways. For many of the facts and most of the figures we are indebted to Mr J. S. Jeans, whose work on *Railway Problems* is a marvel of industrious labour and of intelligent application.

In the time when stage-coaches ran between London and Edinburgh, many days were taken to complete the journey. At the beginning of the century it cost thirteen pounds per ton to convey goods by wagon from Leeds to London; and two pounds per ton from Liverpool to Manchester. Even in 1825 it was complained in Parliament that cotton, which came three thousand miles across the Atlantic in twenty days, required *six weeks* to traverse the thirty odd miles between the Liverpool docks and the Manchester mills.

Within about a dozen years after this time, there were nearly five hundred miles of railway in England and Wales, and about fifty miles in Scotland, open for public traffic. And what is there now? The total length of railways in the United Kingdom is now, with sidings, estimated at close upon twenty-five thousand miles, and the capital invested in them at over eight hundred and twenty millions sterling.

Let us see for a moment what this means as regards labour-power. Our railways carry in round numbers one hundred and seventy millions of tons of 'minerals' annually. Supposing the average distance carried be twenty miles, this means that they carry four thousand millions of tons of minerals *one mile* every year. The same method applied to American railways will show that in the United States between forty-five and fifty thousand millions of tons of traffic are annually moved *one mile*.

The total volume of actual goods carried to all distances on the railways of Europe and the United States is over a thousand millions of tons per annum. This gives an average of about three tons per inhabitant. But in the United Kingdom the average of actual traffic carried is 7·5 tons per inhabitant; and in the United States it is 7·6. Were the same average attained throughout Europe, the total annual traffic would be two thousand five hundred and twenty-five millions of tons. It will help us to understand the significance of these figures if we remember Dr Lardner estimates that a horse of average strength, working for eight or ten hours a day, cannot transport on his back more than two hundredweight, and can only carry this at the rate of twenty-five miles a day over an average level country.

And now about passengers. In 1885 the railways of the United Kingdom carried six hundred and ninety-seven and a quarter millions of persons, which, in round terms, is about equal to every inhabitant making twenty journeys in the year. No other country in the world approaches such an average; the corresponding figure in the case of Belgium, which is the next highest, being only about eleven journeys per inhabitant; while the United States average is six; that of Germany and France about five and a quarter; and that of Austria, Spain, and Italy between one and two. Of course, many persons in all these countries do not travel at all by railway from one year's end to the other, and the sum of population includes both women

and children. But there are no means of getting at the actual number of journeys performed by each traveller; that is to say, that although we know that six hundred and ninety-seven and a quarter millions of 'passengers' were booked by the railways of the United Kingdom in 1885, we cannot possibly tell how many times a single individual is represented in the total. There were six hundred and ninety-seven and a quarter millions of *journeys* made; but by how many separate persons is not recorded, so we can only fall back on 'averages.' But if we extend the average of the passenger traffic of the United Kingdom to the continent of Europe, we shall see that, instead of seven hundred millions of travellers, the continental railways would have five thousand four hundred and fifty-six millions of travellers per annum! And who shall say that such a result will never be reached, when we look back on the rapid development in our country?

One may get some idea of what railways mean in the saving of time and money to passengers, by taking the case of London. It is estimated that about half a million persons, or about one-tenth of the population of the entire area of the metropolis, require to travel to and from their business every day all the year round. If we remember the distances, it is not too much to assume that the railway will economise for each at least two hours in the week—or, say, five days per annum each. This over half a million of people means two and a half millions of days—or an economy of eight thousand three hundred years of three hundred working-days each! Suppose the average earnings of these half-million of people to be one hundred pounds per annum each—not too high an average when we remember the number of millionaires included in the total—we shall see a total money-saving—in the sense of time being money—of equal to eight hundred and thirty thousand pounds per annum. And this in London alone!

We have said that the capital invested in British railways is over eight hundred and twenty millions sterling. A good deal of that has been misspent money—that is to say, money spent in parliamentary contests, extortionate 'compensations,' hush-money to overcome threatened opposition, and the like. In Germany, the railway capital-cost is stated to be four hundred and sixty-five millions; in France, four hundred and sixty-two millions; in Austria, two hundred and sixty-four millions; in Russia, two hundred and eighty-five millions; in Spain, ninety-one millions; and in Belgium, forty-three millions; but in most if not all of these countries some of the railways have been constructed by the State, whereas in Britain every inch has been constructed by private enterprise. The United States, however, have a still more stupendous investment, for the capital embarked in the railways of that country in 1884 was one thousand five hundred and ninety-nine and a quarter millions sterling, and it has grown considerably since. But in the United States also, a considerable part of the railway system was constructed at State cost.

The railways in the United Kingdom constructed up to the end of 1884 cost an average of £42,486 per mile. Our railways are the

dearest in the world; for the average cost in France was only £27,704; in Belgium, £36,508; in Germany, £21,236; in Russia, £20,000; in Scandinavia, £10,000; and in the United States, £11,000 sterling per mile. The large cost in England seems due to these among other causes: the greater cost of the land—generally bought at fancy prices—the greater strength of the permanent way, the larger proportion of double-line, and the heavy expenses of parliamentary and other contests, already alluded to.

The total amount of land acquired and possessed by our Railway Companies was stated in 1868 to be over two hundred and fifty square miles, which is equal to over twelve acres per lineal mile of railway, and to an average width of one hundred and two feet over the whole. If the purchases since have been in the same proportion, the railways must now own about two hundred and thirty-five thousand acres, or one-three-hundred-and-twenty-third ($\frac{1}{323}$) part of the entire area of the United Kingdom. Mr Jeans places the capital outlay by the railways for land at an average of four thousand pounds per mile of railway, which would mean that seventy-six millions sterling of the capital has been expended on land-purchases. Curiously enough, this would give an average cost of three hundred and twenty-three (323) pounds per acre.

The following table shows the actual total of railways open in the several countries in 1883, which is the latest year in which we can find returns from all the countries:

Countries.	Railways Open.
Germany.....	22,423 miles.
Belgium.....	2,700 "
France.....	18,725 "
Switzerland.....	1,795 "
Italy.....	5,871 "
Austria.....	12,846 "
Holland.....	1,406 "
Denmark.....	1,005 "
Norway.....	970 "
Russia.....	14,478 "
United States.....	120,549 "
United Kingdom.....	18,681 "

With regard to these figures, it is to be noted that the number of 'miles open' for traffic does not mean the total mileage of railway tracks; for there are sidings and so forth which do not count in the traffic returns. Thus, the United States had actually 149,181 miles of rails, although only 120,549 miles were open for traffic; and the figure for the United Kingdom including sidings is now close upon twenty-five thousand miles.

As regards colonial railways, the totals in 1884 were as under:

Countries.	Railways Open.
India.....	10,447 miles.
Canada.....	9,575 "
Cape Colony.....	1,344 "
Victoria.....	1,562 "
New South Wales.....	1,618 "
New Zealand.....	1,396 "
Queensland.....	1,207 "
South Australia.....	1,036 "

Total.....28,185 miles.

This gives an average of one mile of railway to every two hundred and sixty-nine square miles of area, and every seven thousand three hundred and seventy-nine inhabitants. But in the United

States there is one mile of railway to every twenty-five square miles, and every two thousand three hundred and twenty-one inhabitants; and in the United Kingdom, one mile of railway to every six miles of area, and every two thousand inhabitants. What room for possibilities there is for railway expansion in the colonies, these figures can help us to guess.

The economics of railways cannot be considered without some examination of them as forms of invested capital—vehicles, so to speak, of industrial production, for a railway is in one sense as much an instrument of production as is a factory. Many Railway Companies are indeed manufacturers in a large and literal sense, making locomotives, wagons, &c. for their own use; while each of them is a large employer of labour, and all of them form a system which is indispensable to the industrial existence of the country at large.

The most noticeable thing about British railways, as a form of invested capital, is that since 1854 there have only been three years when the average dividend fell below four per cent., and only three years in which it exceeded four and a half per cent. From this, then, it would appear that the normal average return over a period of years ranges between four and four and a half per cent.; but while the average remains so stable, there are, of course, considerable and frequent fluctuations in the fortunes of the individual lines. Then, as regards the component parts of the United Kingdom—the system of England and Wales pays an average of 4·27 per cent.; that of Scotland, one of 3·6 per cent.; and that of Ireland, one of 3·5 per cent.—taking the returns of 1884 as bases. The average would be higher in each case but for the fact that there are a number of lines so loaded with ‘guaranteed’ and ‘preferential’ capital, that the ordinary share-capital has not received any dividend at all for years. In 1884 there was a total of about two hundred and ninety-nine millions sterling of such capital which has received no dividend since 1870. As a set-off to this, we find that the five largest railways in the country—the Midland, the London and North-Western, the Great Northern, the North-Eastern, and the Great Western—representing together about three hundred and thirty-eight millions sterling—paid in 1884 an average of over six per cent. on the ordinary share-capital.

In the United States, the one thousand five hundred and ninety-nine and a quarter millions sterling invested in railways yielded an average dividend of 5·4 per cent.; but yet more than eighteen per cent. of the whole paid either nothing at all or less than one per cent.

Few persons are aware of the enormous mass of labour employed, as well as saved, by railways. In the United Kingdom, according to a return obtained by Mr Broadhurst in the House of Commons, there were in 1884 no fewer than 367,793 persons directly employed on and in connection with the railways. In the United States, the railway employees numbered 630,000; and on the Continent, 1,076,649. This gives a total of over two millions of individuals whose labour is directly employed in railway enterprise; but this total does not by any means represent all who are indirectly employed, in the manufacture of rails, locomotives, sleepers, stores, in furnishing

fuel, &c. In our country, our textile and mining industries employ directly more persons than do our railways; but in the United States there is no single industry, except agriculture, which absorbs so much labour as do their railways.

Now, how do the earnings of our railways compare with the profits from other capital investments forming the wealth of the country? In 1884 the net profits of railways were, say, thirty-three and a quarter millions sterling; the rents of house-property, one hundred and twenty-seven millions; the rents of landed property, sixty-five and a half millions; the returns from mines, seven millions; from iron-works, three millions; from gas-works, four millions; and from quarries, nine millions. All of these sources of income fluctuate very much more, over a term of years, than do railways, and are, therefore, not so attractive for steady investment. But taking the figures as they are, we see that railways represent one of the most important capital-stocks in the country. We may look at it in another way. If all the agricultural land in the United Kingdom were capitalised on an average of twenty shillings per acre and twenty years’ purchase, the capital value of the land would now be one thousand millions sterling. Our railways, as we have seen, represent a capital value of eight hundred and twenty millions sterling, or only one hundred and eighty millions less than our agricultural land.

Thus, we see that King Railway is growing to be the most powerful economic force in the world, with reference to both labour and capital.

We may see, and be thankful for it, that railways have really been the factor which has cheapened the cost of living to our struggling millions; has opened up the great New World in the West, and enabled it both to produce and to find markets for its produce; has placed alike the Russian peasant and the Indian ryot in touch with the Western world; has welded the nations together as with an iron hand. One may go further, and say that King Railway has done more than either the Peace Society or the ingenuity of inventors of destructive weapons in preventing and shortening wars. The nations still quarrel and still fight; but campaigns are now short, if sharp, and the more railways are extended, the shorter and less frequent must they become.

AT A VILLAGE OFF THE MAIN ROAD IN PERSIA.

WE had started at midnight. It is raining cats and dogs. We are pretty well wrapped up, my wife and I; but the continuous downpour is beginning to penetrate, and I get suggestive hints as to the luxury of a good cry. We are marching; that is to say, day after day we are riding stages of twenty to thirty miles. Without any break, our journey will last twelve days. Our twenty mules, carrying our luggage, road-kit, and servants, are some ten miles behind, for with our head-man we have pushed on in hope of shelter. The rain comes down in sheets. My heavy ulster, soaked with moisture but still waterproof, seems to be a ton-weight upon my tired shoulders; a tiny stream of icy water is trickling

into my right boot. I have taken off my gloves some time ago—they were as wet sponges. My wife is in a similar plight. She is wearing a Mexican blanket—with a hole in it, through which she has thrust her head—over her habit. Her mare has cast a shoe, and has consequently gone lame. My tobacco has given out. Our plight is sufficiently miserable. At our side, alternately thrashing his wretched muleteer's pony and cursing his luck, rides our treasure, our factotum, Malek Mahommed, my servant of twelve years, the man whose talents as a cook and intriguer make life in Persia bearable, and even pleasant. The load on which he is perched gives out a metallic clank. From his pack-saddle on one side hangs a smouldering firepot; on the other, a huge leathern water-bottle. He is smoking his *kahian*, or hubble-bubble. My man is quite dry, for he has on a *yapunja*, or shaggy woollen coat. It is black in colour, and exactly like a very shaggy bearskin in appearance.

All at once out goes the hand of Malek Mahommed. 'There it is, sahib. I see the smoke.'

Sure enough, just then something looms up out of the mist and rain. There is no doubt, for we hear the welcome barking of the village dogs. My man gives a yell and rides on. When we arrive, we find him pounding on the apparently inhospitable gates of a walled village two hundred yards square. 'Dogs, sons of burnt fathers, open! May your,' &c.—Not a sound save the violent barking. Is it uninhabited? No; the telltale smoke answers this question. 'Asses, fools! I tell you it is a sahib!' yells Malek Mahommed as he rattles at the wooden gates.

I now join him in shouting, and assure the reluctant inhabitants that all is right. In the meanwhile our horses are literally knee-deep in mud, and down comes the rain. At length a shrill voice demands what we want.

'Want!' shrieks Malek Mahommed—'want! daughter of the nether regions. Shelter, of course!'

The gates are flung open; and an aged crone of repulsive aspect, leaning on an iron-headed stick, appears; a crowd of lean and barking curs rush upon us; a few cuts from my hunting-whip make them slink back. Slowly we blunder into the gateway through the black and slippery mud. Within the village walls there is no sign of life save the smoke and the loud bleating of lambs.

There are some twenty hovels of a beehive shape, some sheds; a few of the rough implements of Persian agriculture are strewn about. The hag precedes us.

'This way, my darling—this way, lord of my soul.'

Why all this sweetness? Whence this welcome? Does not the old woman's hand clasp a bright *keran* (tenpence), and is she not aware that we are Europeans? A Persian bigwig enters a village or house by force—by force he lives at free quarters on the inhabitants. If the place suits him, he will not leave until compelled, or bribed, to do so. The European of course pays for what he has, gives a small present in leaving, and is ever a welcome guest.

At the door of one of the beehives I descend;

a woman takes our horses, when I have helped down my wife. We enter the beehive by a door four feet high. The place is full of smoke, acrid smoke. We get out of our dripping wraps; a smiling and unveiled village woman takes them. We hurriedly lie down on the carpet, for only the upper part of the beehive is full of smoke. Now we escape it. Our boots are removed by giggling women. Our cook has taken possession of an adjoining beehive. As we sprawl on the carpet, we take stock of the place. We lean on the rolls of bedding of our village host; it is poor, but scrupulously clean. The lower part of the walls is whitened; the upper part, jet black from the smoke, which makes its exit from a round hole in the apex of the hive. This curious room is some twenty feet in diameter, and is lighted by the chimney-hole and the door. Another door communicates with another hive-like room at the side. Furniture there is none. A few timeworn leathern trunks contain our host's worldly wealth; a few grimy jars his treasure, his opium harvest. Some cotton pods lie in one heap, some barley in another. He trusts us entirely, or rather his wife does, for all the able-bodied men are at work in the fields in the rain.

Malek Mahommed enters smiling, and divested of his wraps. A ferocious-looking fellow truly. A broad *kummar*, or straight sword, hangs from his side; a single-barrelled pistol and a straight knife are in his girdle, into which is also thrust a riding-whip with many tails and a short handle. His boots—carefully wiped—and his gay scarf add to his tremendous appearance. His nose is red from exposure; his eyes run from standing over the smoky fire. But he smiles as he hands us the steaming tea he has just prepared, and then hurries off to bring my private hubble-bubble. We swallow our tea. I smoke my pipe, and as I do so, I hear the shouts of our servants and the muleteers, who are just arriving. We drop off to sleep: it is ten o'clock in the morning.

We awake, and lazily stretch ourselves. It is now one. What a change! The sunlight is streaming in at the open door. It is hot, terribly hot. The rain is over. We gingerly make our way over the stepping-stones through the black mud. In front of and outside the village is a piece of turf; here are some thirty women and girls gossiping. From a pen in the centre of the grass comes the bleating of lambs; there the little things lie and cry in a party-coloured mass of black, white, brown, and gray. Malek Mahommed is selecting a victim for our dinner: he finds at length the fattest of the flock; he pays two shillings to the owner, after some haggling. Both parties are evidently pleased, for both grin happily. And we are now surrounded by the women, all unveiled, for the villager only veils in the towns. Such questions, such laughter, such compliments. Tongues go twenty-four to the dozen. We inform the village beauty that she has eyes like a gazelle; she discreetly retires, smiling, but lowering her veil. Some little joking takes place. My wife distributes a few needles. We are all like old friends. But the bleating from the pen becomes more urgent; responsive baas are heard approaching. Shouts and barking proclaim the arrival of the village flock and shepherds. The ewes rush violently

towards the pen; so do the village wives and maidens. Each singles out a lamb and rushes with it to its expectant mother. There is a considerable mixture; many mistakes occur; indignant mothers repudiate lambs not their own. At last, each ewe having found its offspring reposes at ease. The loud bleating decreases. The sons and fathers of the village now make their appearance. My wife retires. I sit and smoke, chatting with the village graybeards—local politics, the price of grain, the wickedness of provincial governors. 'Yes, sahib, the opium, the opium—that is our salvation; but it is gambling, pure gambling.' We assent; and so on, and so on.

These Persian villagers are dressed cheaply but comfortably; in fact they are well and warmly clad. Every man has his thick felt overcoat, impervious to wind or weather; his blue cotton *pyjamas* and shirt. They are all barefooted, for it is muddy; but each man carries his *ghevas*, or shoes of leather-bound cotton, in his girdle. Every man has his conical hat or round cap of brown felt. By judicious pumping, I get a pretty accurate insight into the life of the Persian villager. He lives well, he dresses in a homely fashion, and if his landlord or the government tax-gatherer arrives—taxes are paid in kind—he puts on his most ragged garments. Money he seldom sees; barter is the usual mode of conducting business. If he gets hold of actual coin, he buries it; for in Persia there are no banks save in the great towns, and even there the bankers are in the position of mere tradesmen and live by usury. The villager seldom sees roast-meat; but he lives well on bread, boiled rice, soup, milk, butter, cheese, and curds. Fruits are a staple food, as grapes, apples, apricots, and plums. So are vegetables, as radishes and cucumbers. The latter are eaten in immense quantities, and are quite harmless.

This is a village off the main road, and we are the first Europeans the women-folk have ever seen. The sun is nearly set as we sit smoking and chatting. And now my smiling *peishkhidmut* (table-servant) announces dinner and that our beehive is carpeted and furnished. Welcome news! I hasten off, for we must be in the saddle again an hour after midnight. We travel thus to avoid the noonday sun.

A DEFENCE AGAINST SCAMPED AND DEFECTIVE PLUMBER-WORK.

Some years have now elapsed since the Court of the London Plumbers' Company recommended a scheme for the registration of efficient plumbers, both masters and journeymen, and for giving technical instruction in plumbing and for the thorough inspection of work done. The conference on this subject at the 'Healtheries' in 1884 was a great success, and somewhat advanced the question. The Plumbers' Company has already spent two thousand pounds in advancing the matter, and have received between seven and eight hundred pounds in registration fees. The movement has spread to Scotland; and at influential meetings held in Edinburgh and Glasgow co-operating district Councils have been formed for the east and west of Scotland. The design

of the movement is to enable the public to distinguish between qualified and unqualified plumbers. The system of registration adopted makes it necessary that there shall be one standard of excellence to which all men must attain before they can be registered as plumbers. No man can receive a certificate of registration until he has given satisfactory evidence that he is capable of doing his work thoroughly and well; and failing this, no one will be put on the register of plumbers.

The London and Scottish conferences brought out the same facts. To sanction inferior plumber-work was a penny-wise and pound-foolish policy. The work of the mason and painter can be so far inspected and criticised; that of the plumber is largely secret and hidden. Defects become known through a leakage of gas, or of foul air from a soilpipe. The bursting of a pipe sometimes destroys twenty times the value of the plumber-work which caused the mischief. Loss of health can sometimes be directly traced to bad plumber-work. Mr G. Shaw, the originator of the movement, is of opinion that our present system of building, which prevents the architect from coming into direct contact with the plumbers, is a vicious one. Contracts were given to general builders who had little or no knowledge of plumber-work, and who employed incompetent men at a lower rate of wages than was paid to efficient plumbers, who should be held responsible for the effective nature of the work done. The co-operation is sought of local authorities, architects, the medical profession, and others who can practically advance this work. It is also proposed to help the formation of technical classes of instruction for plumbers. This movement is so bound up with the interests of suffering humanity, that we heartily wish it all success.

THE FLOWER QUEEN.

A DEWY rose, blood-red,
Sweet perfume whilom shed,
For me alone:
It was the last of all;
And now its petals fall,
Their crimson radiance gone, their odorous duty done.

The bright flowers of the sun,
Though day is long begun,
Hang sadly down;
They mourn the dying Queen;
And all their golden sheen,
My garden's sunny crown, has faded into brown.

Pale, snow-white lily-bells
Ring sweet sad soundless knells,
Mourning the dead;
Dim requiems of the breeze
Sigh 'mid the tasselled trees,
Where Autumn's gold and red with fading leaves are wed.

EMIN PASHA.

ALTHOUGH the name of the heroic governor of the Equatorial Province of the Soudan is now familiar to every schoolboy in both hemispheres, it is not every one who knows that the name is an assumed one. The word 'Emin' is Arabic; it means 'The Faithful One,' and surely never was adopted name more appropriate to the person using it.

The real name of the bearer of it is Eduard Schnitzer, a native of the small town of Oppeln, in Prussian Silesia, where he was born on the 28th of March 1840. His father was a merchant, who in 1842 removed to Neisse, in the same province, where his mother and sister still reside. According to a biographical sketch in a work published in Germany last year, and a translation of which has recently been published in this country under the supervision of Dr Felkin,* Eduard was educated first at the Gymnasium at Neisse, and then at the Universities of Breslau and Berlin, at the latter of which he graduated in medicine in the year 1864. He was distinguished even as a boy by a strong desire to travel and a great love for natural history; and it was for the gratification of both feelings that, after receiving his degree, he began to look for work in a foreign land. About the end of 1864 he went to Turkey, and there made the acquaintance of the Vali Mushir Divitji Ismail Hakki Pasha, who gave him a post on his staff during official journeys through Armenia, Syria, and Arabia. This appointment seems to have occupied Dr Schnitzer until 1873, when Hakki died. After spending a couple of years or so in Turkey, Schnitzer returned to Neisse, and spent a few months with his family there, devoting himself the while to the study of natural history. But the wandering spirit was irrepressible, and in 1876 Dr Schnitzer went to Egypt and entered the service of the Khedive as Dr Emin Effendi. His

reason for adopting this name was that he might get rid of every external indication which might stand in the way of his usefulness in the Mohamadan world in which he was resolved to labour. He knew the prejudices of the followers of Islam, and their dislike, and even hatred, of anything of 'Frankish' association, and he believed that he could best carry on his work by discarding his German name. Writing to his sister from Trebizond, he informs her that he has quickly gained a reputation as a doctor among the Turks, and adds: 'This is due to the fact that I know Turkish and Arabic as few Europeans know them, and that I have so completely adopted the habits and customs of the people, that no one believes that an honest German is disguised behind the Turkish name. Don't be afraid: I have only adopted the name; I have not become a Turk.'

His German biographer informs us that Emin has an extraordinary gift for the acquisition of foreign languages. Besides German, French, English, and Italian, he knew several Slavonic languages, and Turkish, Arabic, and Persian. No doubt he is now quite proficient in many of the dialects of Central Africa. To this talent, so invaluable in a traveller, must be ascribed a large measure of Emin's success. Then his medical training has been greatly in his favour; and his cast of mind and of temper seems to be eminently fitted for dealing with the dark races of Africa. He seems, moreover, to have all the firmness and decision of character of his great predecessor, Gordon, without the latter's nervous temperament.

It was under Gordon that Emin served his apprenticeship to African life. Gordon was in 1876 governor of the Equatorial Province, and Emin was sent to him to act as chief medical officer. But Gordon soon saw that the German doctor could be of much more effective service than in walking the hospital, and he was accordingly despatched on various tours of inspection through the districts, and was also sent on important missions to the kings of Uganda and Unyoro—countries and potentates which bulk so

* *Emin Pasha in Central Africa: being a Collection of his Letters and Journals.* Edited and annotated by Professor Schweinfurth, Professor Ratzel, Dr Felkin, and Dr G. Hartlaub. London: George Philip and Son.

largely in the story of Africa. Gordon relinquished his governorship of the Equatorial Province in 1877, and returning to Egypt, was succeeded by incompetent and corrupt native officers, who soon undid all that he had organised. He left the province peaceful and settled, although labouring under a heavy debt; but his successors quickly reproduced the system of oppression, brutality, and injustice, which had taken so much labour and so many years to put down. Emin, meanwhile, was surgeon-in-chief, but without any definite rank, owing to the intrigues of Khartoum officials. But in the early part of 1878, Gordon came back to Khartoum as governor-general of the whole Soudan, and appointed Emin to be governor of the Equatorial Province, the post which he had himself held for over three years.

That province was once more in a state of disorganisation. It was peopled by a number of different tribes, who had thriven under Gordon's rule, but were now suffering under the oppression of his successors. The slave-dealers had recommenced their operations, and were settled in fortified villages all over the land. The officials were mostly disreputable men—criminals in many cases, banished from Egypt, but whose sentences had expired—and the Egyptian soldiers were untrustworthy. The stations had fallen into disrepair, and a block on the Nile cut off Emin's supplies for the first two years of his rule.

Within a year, however, Emin had reduced the province to order. 'Slowly but surely, and with ever-increasing success,' says Dr Felkin, 'he became master of the situation; and when I passed through his province for the second time in 1879, a most wonderful change had taken place. Stations had been rebuilt, discontent was changed into loyal obedience, corruption had been put down, taxation was equalised, and he had already begun the task of clearing his province from the slave-dealers who infested it. This was a difficult and dangerous undertaking, for they had rooted themselves very firmly in the soil, and most of the officials in Emin's employ were in full sympathy with them. Emin was entirely alone: no friend or helper was near. Indeed, with the exception of a few months when Lupton Bey was his second in command, he has been alone from the day of his appointment in March 1878 until the present time.'

Before the end of 1882, Emin had proved himself not only a capital doctor, a capable and humane governor, and a skilful general, but also a most successful economist and financier. Not only were the slave-dealers banished and the Egyptian soldiers replaced by trustworthy natives, but also large districts had been added to his territory by peaceful diplomatic negotiation, and the people had settled down to the cultivation of cotton, indigo, rice, coffee, sugar, &c. Gardening was being industriously prosecuted at the stations, the roads between them were being made permanently passable, and a weekly post had been established through the territory. And lastly, a province which even in Gordon's time could not pay its own expenses, and involved a charge of over thirty thousand pounds sterling a year on the Egyptian exchequer, was not only now self-supporting, but was showing

a clear profit of eight thousand pounds, and later of ten thousand pounds sterling per annum. It is well, indeed, for Emin that he did make the province self-supporting, since, from 1878 to 1884, only six steamers had come to Lado (his chief station) from Khartoum with supplies; and since 1884—the year of the Mahdi successes—he has been wholly shut off from the world.

Of course, during the disturbances of the Mahdi revolt, the prosperity of the province suffered considerably; and indeed at one time it seemed as if Emin would have to follow the example of Lupton and surrender to the False Prophet. Those disturbances began so far back as 1881, although it was not till December 1884 that they reached a climax in the fall of Khartoum and the murder of Gordon, who had returned, as all know, at the request of the British government, at a time when he was preparing to go to the Congo. It was towards the end of 1883 that Emin began to feel things uncomfortable, and to receive reports of the serious troubles in the north. Dr Junker reached him towards the end of January 1884, but was unable to progress farther down the Nile, and had to remain with Emin until January 1885. Then he made a push through Uganda, was enabled to despatch some needful supplies to Emin, and managed finally to reach Cairo by way of Zanzibar, in time to meet Stanley on his way out to relieve Emin. Writing in August 1884, Emin says that for fourteen months he had had no news from Khartoum, and that his magazines were empty; but he had heard of the surrender of Lupton, and had himself been called on peremptorily by one of the Mahdist commanders to surrender also. His troubles and difficulties then were many and great; but he held on, and by-and-by heard of the Mahdist reverses, which confirmed him in his determination to stick to his post and his trust. In March 1886, he received from Dr Junker a packet of letters and newspapers, which for the first time made him acquainted with all the events in Egypt and in the Soudan, and also with the first news from Europe he had had for over three years. He writes: 'So now I had the whole of the sad drama before me which ended in Gordon's death, the retreat of the English, and the loss of the Soudan; and it came back to my mind most vividly how the editor of the *Times* had remarked in a note to a communication from me that I took too gloomy a view of the situation; for I had warned the English not to think too lightly of the state of affairs in the Soudan, and not to let themselves be deceived by an illusory religious movement where very different objects were really aimed at. Poor Gordon!'

With the packet from Dr Junker he received a despatch from the Egyptian government, informing him that they were unable to assist him, that the Soudan was to be given up, and that he might leave the country as soon as he pleased. Emin calls this 'a cool business despatch in the fullest sense of the word,' and says: 'They simply suggest to me the way to Zanzibar just as they would a walk to Shubra.' But the way to Zanzibar was no longer open; and even if it had been, Emin would not forsake his people and the country which he had

laboured so long and so successfully to bring into a condition of order and prosperity.

Of the future of the country, he has large expectations: its natural beauties, its fertility, its mineral resources, and the growing habits of industry of the people, all mark it as a promising field for commercial expansion. The products are such as Europe requires—india-rubber, ivory, sugar, coffee, cotton, skins, &c.—and the people are settling into a condition for requiring European manufactures in return.

So far we have looked at Emin in his administrative capacity mainly; but in his journals and letters we find him to be distinctively a man of science. Nothing escapes him, and his powers of observation are remarkable. Dr Hartlaub says: 'The amount of work which Emin Pasha has performed in making zoological collections, observations, and notes, is astonishing in the highest degree. It could only have been performed by a man whose heart was aglow with the pure fire of scientific instinct, with enthusiastic, absolutely unselfish, love of Nature, and with an irresistible impulse to add to the knowledge of her treasures to the full extent of his powers. Emin was able to turn this impulse into action, notwithstanding the pressure of difficult surrounding circumstances and the many and varied duties which his high position compelled him to fulfil.'

The journals as yet received, and now published, contain the records of a number of journeys made through his territories down to 1887. They are so full of most interesting information about the physical characteristics of the country, about the people, the botany, the zoology, &c., that it is difficult to know what selection to make for the purposes of this paper.

One of the most striking things to be met with in the earlier pages is a reference to a report which is brought to him between Lado and Dufile on the Upper Nile, that a race of dwarfs inhabit mountain caves to the west of Bedén. They were said to be only forty inches high, of a brown colour, and of great agility, to eat white ants and roots, and to shoot with very small arrows which are poisoned, and very difficult to extract. These pygmies he was inclined to regard as the remainder of a dwarf population which ages ago spread itself over Central Africa. Four years later, he himself comes upon some specimens of the Akka, a pygmy people, divided into numerous small tribes, who lead a nomadic life in the Monbuttu country. One of these Akka 'had a reddish but rather dark skin (probably dirt), was very prognathous, rather swag-bellied, but exceedingly nimble. His height was three feet six inches. His whole body was covered by thick stiff hair, almost like felt, which was especially thick on the breast.' A girl fourteen years of age measured three feet and seven-eighths of an inch in height! These people are said to be very expert hunters, but also very vindictive, so that the neighbouring tribes are glad to let them have all they want for maintenance in return for skins and feathers, the products of the chase, which they prosecute with bows and arrows alone.

In the country of the Bari (near Gondokoro or Lado) Emin had a curious experience with a lion. One day he came upon one caught in a pitfall, and a chief named Lottor was sent for to get it out. He pushed into the pit branches of trees, by

means of which the lion came out of the hole, and after giving a roar of acknowledgment, walked off unharmed. This is mentioned as illustrative of the fact that 'the lions here are really good-tempered, and also much admired.' He was told by the negroes that this Lottor always keeps two tame lions in his house, and as long as he receives occasional presents of corn and goats, prevents the wild lions from doing any mischief.

Among one of the Dinka tribes he comes upon an ingenious method of utilising snakes. These are secured by stratagem, and then a pool of water is enclosed by a strong thorn fence, so arranged that the game coming to drink must pass through a narrow lane. The snakes, which are fastened by a hole bored through the tail, and placed near this opening, bite the animals as they attempt to pass. In this way a supply of game is always obtainable without the trouble of hunting.

A curious method of salutation is noted among the Shuli, a people who inhabit the Fatiko district. They are very polite, but must be somewhat uncomfortable acquaintances. They are always greeting each other, and always inquiring after the health of those they encounter, and their method of greeting is to raise the arms of the visitor four or five times above his head. Morning-calls in that country must be a severe and fatiguing gymnastic exercise.

In the Kedebu country we come upon the pile-dwellings. 'A platform supported upon over three hundred stout piles, each one six feet high, stood within a broken-down bamboo fence. It had a length of ninety feet, a width of eighty feet, and was made of timber and brushwood, and covered with clay and cow-dung, to form a level flooring. The ground-floor among the piles serves as a kitchen and storehouse; the water-jars and the *murhakka* (grindstone) are placed in it, and the servants sleep there. A square hole in the centre of the platform provides this lower room with light, and ladders lead through the hole to the platform. This latter is divided by a reed-fence into an outer and an inner compartment, the former containing two large huts, each about fifteen feet in diameter, with neat mud walls about three feet high, and a lofty conical roof. These two huts serve as a dwelling-place for the master of the house. The inner compartment, or harem, contains six smaller huts. The whole arrangement is really curious, especially here, where the ground is not swampy, and where termites [white ants] are only seldom found, so that there appears to be no real reason for such a method of house-building.' Around each homestead is a garden, in which are grown maize, onions, beans, egg-apples, bananas, lemons, bitter oranges, &c.

The journals are full of curious matter, from which we would willingly extract further did space permit. The chief practical interest, however, consists in the manner in which Emin has contributed to the more accurate mapping out of the whole country, and in the attention which he has given to testing the fertility of the land and its suitability for productive and commercial cultivation. Doubtless more will be heard from him on these points when Stanley returns.

That one who has lived so long in this isolated region, and who has so identified himself with the people, should be able to present us with more

life-like descriptions and more accurate reports than any mere occasional traveller, goes without saying. It may therefore be truly said that the world will owe more to Emin for knowledge of Central Africa than to any other single individual. His powers of description are great; and we have Dr Felkin's testimony that his whole heart is centred in the welfare of his people and in the advancement of science, without any thought of personal fame. But such fame he has already secured by the peculiar nature of his situation, and by the heroic manner in which he has clung to his post and devoted himself to the duty bequeathed to him by Gordon. No figure in all the strange and moving romance of African story will stand out with greater distinctness and in greater eminence than that of the unselfish, hard-working, science-loving, and humanitarian German doctor now known as Emin Pasha.

THIS MORTAL COIL.

CHAPTER XXII.—HOLY MATRIMONY.

THE way of the transgressor went easy for a while with Hugh Massinger. His sands ran smoother than he could himself have expected. His two chief bugbears faded away by degrees before the strong light of facts into pure nonentity. Relf did not know that Elsie Challoner lay dead and buried in a lonely grave at Orfordness; and Winifred Meysey was not left a ward in Chancery, or otherwise inconvenienced and strictly tied up in her plans for marrying him. On the contrary, the affairs of the deceased were arranged exactly as Hugh himself would have wished them to be ordered. The will in particular was a perfect gem: Hugh could have thrown his arms round the blameless attorney who drew it up: Mrs Meysey appointed sole executrix and guardian of the infant; the estate and Hall bequeathed absolutely and without remainder to Winifred in person; a life-interest in certain specified sums only, as arranged by settlement, to the relict herself; and the coast all clear for Hugh Massinger.

Everything indeed had turned out for the best. The late Squire had chosen the happiest possible moment for dying. The infant and the guardian were on Hugh's own side. There need be no long engagement, no tremulous expectation of dead men's shoes now: nor would Hugh have to put up for an indefinite term of years with the nuisance of a father-in-law's perpetual benevolent interference and well-meant dictation. Even the settlements, those tough documents, would be all drawn up to suit his own digestion. As Hugh sat, decorously lugubrious, in the dining-room at Whitestrand with Mr Heberden, the family solicitor, two days after the funeral, he could hardly help experiencing a certain subdued sense of something exceedingly akin to stifled gratitude in his own soul towards that defective breech-loader which had relieved him at once of so many embarrassments, and made him practically Lord of the Manor of Consumptum per Mare, in the hundred of Dunwich and county of Suffolk, containing by admeasurement so many acres, roods, and perches, be the same more or less—and mostly less, indeed, as the years proceeded.

But for that slight drawback, Hugh cared as

yet absolutely nothing. One only trouble, one visible kill-joy, darkened his view from the Hall windows. Every principal room in the house faced due south. Wherever he looked, from the drawing-room or the dining-room, the library or the vestibule, the boudoir or the billiard-room, the Whitestrand poplar rose straight and sheer, as conspicuous as ever, by the brink of the Char, where sea and stream met together on debatable ground in angry encounter. Its rugged boles formed the one striking and beautiful object in the whole prospect across those desolate flats of sand and salt marsh, but to Hugh Massinger that ancient tree had now become instinct with awe and horror—a visible memorial of his own crime—for it *was* a crime—and of poor dead Elsie in her nameless grave by the Low Lighthouse. He grew to regard it as Elsie's monument. Day after day, while he stopped at Whitestrand, he rose up in the morning with aching brows from his sleepless bed—for how could he sleep, with the breakers that drowned and tossed ashore his dear dead Elsie thundering wild songs of triumph from the bar in his ears?—and gazed out of his window over the dreary outlook, to see that accusing tree with its gnarled roots confronting him ever, full in face, and poisoning his success with its mute witness to his murdered victim. Every time he looked out upon it, he heard once more that wild, wild cry, as of a stricken life, when Elsie plunged into the careering current. Every time the wind shrieked through its creaking branches in the lonely night, the shrieks went to his heart like so many living human voices crying for sympathy. He hated and despised himself in the very midst of his success. He had sold his own soul for a wasted strip of swamp and marsh and brake and sand-hill, and he found in the end that it profited him nothing.

Still, time brings alleviation to most earthly troubles. Even remorse grows duller with age—till the day comes for it to burst out afresh in fuller force than ever and goad its victim on to a final confession. Days and weeks and months rolled by, and Hugh Massinger by slow degrees began to feel that Othello was himself again. He wrote, as of old, his brilliant leaders every day regularly for the *Morning Telephone*: he slashed three-volume novels with as much vigour as ever, and rather more cynicism and cruelty than before, in the *Monday Register*: he touched the tender stops of various quills, warbling his Doric lay to Ballade and Sonnet, in the wonted woods of the *Pimlico Magazine* with endless versatility. Nor was that all. He played high in the evening at Pallavicini's, more recklessly even than had been his ancient use; for was not his future now assured to him? and did not the horrid picture of his dead drowned Elsie, tossed friendless on the bare beach at Orfordness, haunt him and sting him with its perpetual presence to seek in the feverish excitement of roulette some momentary forgetfulness of his life's tragedy? True, his rhymes were sadder and gloomier now than of old, and his play wilder: no more of the rollicking, humorous, happy-go-lucky ballad-mongering that alternated in the *Echoes from Callimachus* with his more serious verses: his sincerest laughter, he knew himself, with some pain was fraught, since Elsie

left him. But in their lieu had come a reckless abandonment that served very well at first sight instead of real mirth or heartfelt geniality. In the old days, Hugh had always cultivated a certain casual vein of cheerful pessimism: he had posed as the man who drags the lengthening chain of life behind him good-humouredly: now, a grim sardonic smile usurped the place of his pessimistic *bonhomie*, and filled his pages with a Carlylese gloom that was utterly alien to his true inborn nature. Even his lighter work showed traces of the change. His wayward article, 'Is Death Worth Dying?' in the *Nineteenth Century*, was full of bitterness; and his clever skit on the Blood-and-Thunder school of fiction, entitled *The Zuluhiad*, and published as a Christmas 'shilling shocker,' had a sting and a venom in it that were wholly wanting to his earlier performances in the same direction. The critics said Massinger was suffering from a shallow spasm of Byronic affectation. He knew himself he was really suffering from a profound fit of utter self-contempt and wild despairing carelessness of consequence.

The world moves, however, as Galileo remarked, in spite of our sorrows. Three months after Wyville Meysey's death, Whitestrand received its new master. It was strange to find any but Meyseys at the Hall, for Meyseys had dwelt there from time immemorial; the first of the bankers, even, though of a younger branch, having purchased the estate with his newly-gotten gold from an elder and ruined representative of the main stock. The wedding was a very quiet affair, of course: half-mourning at best, with no show or tomfoolery; and what was of much more importance to Hugh, the arrangements for the settlements were most satisfactory. The family solicitor wasn't such a fool as to make things unpleasant for his new client. Winifred was a nice little body in her way, too; affectionately proud of her captive poet: and from a lordly height of marital superiority, Hugh rather liked the pink and white small woman than otherwise. But he didn't mean to live much at Whitestrand either—'At least while your mother lasts, my child,' he said cautiously to Winifred, letting her down gently by gradual stages, and saving his own reputation for kindly consideration at the same moment. 'The good old soul would naturally like still to feel herself mistress in her own house. It would be cruelty to mothers-in-law to disturb her now. Whenever we come down, we'll come down strictly on a visit to her. But for ourselves, we'll nest for the present in London.'

Nesting in London suited Winifred, for her part, excellently well. In poor papa's day, indeed, the Meyseys had felt themselves of late far too deeply impoverished—since the sandhills swallowed up the Yondstream farms—even to go up to town in a hired house for a few weeks or so in the height of the season, as they had once been wont to do, during the golden age of the agricultural interest. The struggle to keep up appearances in the old home on a reduced income had occupied to the full their utmost energies during these latter days of universal depression. So London was to Winifred a practically almost unknown world, rich in potentialities of varied enjoyment. She had been there but seldom, on

a visit to friends; and she knew nothing as yet of that brilliant circle that gathers round Mrs Bouverie Barton's Wednesday evenings, where Hugh Massinger was able to introduce her with distinction and credit. True, the young couple began life on a small scale, in a quiet little house—most æsthetically decorated on economical principles—down a side-street in the remote recesses of Philistine Bayswater. But Hugh's coterie, though unsuccessful, was nevertheless *ex officio* distinguished: he was hand-in-glove with the whole Cheyne Row set—the Royal Academicians still in embryo; the Bishops Designate of fate who at present held suburban curacies; the Cabinet Ministers whose budget yet lingered in domestic arrears; the germinating judges whose chances of the ermine were confined in near perspective to soup at sessions, or the smallest of small devilling for rising juniors. They were not rich in this world's goods, those discounted celebrities; but they were a lively crew, full of fun and fancy, and they delighted Winifred by their juvenile exuberance of wit and eloquence. She voted the men with their wives, when they had any—which wasn't often, for Bohemia can seldom afford the luxury of matrimony—the most charming society she had ever met; and Bohemia in return voted 'little Mrs Massinger,' in the words of its accepted mouthpiece and spokesman, Hatherley, 'as witty a piece of Eve's flesh as any in Illyria.' The little 'arrangement in pink and white' became, indeed, quite a noted personage in the narrow world of Cheyne Row society.

To say the truth, Hugh detested Whitestrand. He never wanted to go near the place again, now that he had made himself in very deed its lord and master. He hated the house, the grounds, the river; but above all he hated that funereal poplar, that seemed to rise up and menace him each time he looked at it with the pains and penalties of his own evil conscience. At Easter, Winifred dragged him home once more, to visit the relict in her lonely mansion. The Bard went, as in duty bound; but the duty was more than commonly distasteful. They reached Whitestrand late at night, and were shown upstairs at once into a large front bedroom. Hugh's heart leaped up in his mouth when he saw it. It was Elsie's room: the room into which he had climbed on that fateful evening; the room bound closest up in his memory with the hideous abiding nightmare of his poisoned life; the room he had never since dared to enter; the room he had hoped never more to look upon.

'Are we to sleep here, Winnie?' he cried aghast, in a tone of the utmost horror and dismay. And Winifred, looking up at him in silent surprise, answered merely in an unconcerned voice: 'Why, yes, my dear boy; what's wrong with the room? It's good enough. We're to sleep here, of course—certainly.'

He dared say no more. To remonstrate would be madness. Any reason he gave must seem inadequate. But he would sooner have slept on the bare ground by the river-side than have slept that night in that desecrated and haunted room of Elsie's.

He did not sleep. He lay awake all the long hours through, and murmured to himself, ten thousand times over, 'Elsie, Elsie, Elsie, Elsie!'

His lips moved as he murmured sometimes. Winifred opened her eyes once—he felt her open them, though it was as dark as pitch—and seemed to listen. One's senses grow preternaturally sharp in the night watches. Could she have heard that mute movement of his silent lips? He hoped not. O no; it was impossible. But he lay awake till morning in a deadly terror, the cold sweat standing in big drops on his brow, haunted through the long vigils of the dreary night by that picture of Elsie, in her pale white dress, with arms uplifted above her helpless head, flinging herself wildly from the dim black poplar, through the gloom of evening, upon the tender mercies of the swift dark water.

Elsie, Elsie, Elsie, Elsie! It was for this he had sold and betrayed his Elsie!

In the morning when he rose, he went over to the window—Elsie's window, round whose sides the rich wistaria clambered so luxuriantly—and looked out with weary sleepless eyes across the weary dreary stretch of barren Suffolk scenery. It was still winter, and the wistaria on the wall stood bald and naked and bare of foliage. How different from the time when Elsie lived there! He could see where the bough had broken with his weight that awful night of Elsie's disappearance. He gazed vacantly across the lawn and meadow towards the tumbling sandhills. 'Winifred,' he said—he was in no mood just then to call her Winnie—'what a big bare bundle of straight tall switches that poplar is! So gaunt and stiff! I hate the very sight of it. It's a great disfigurement. I wonder your people ever stood it so long, blocking out the view from their drawing-room windows.'

Winifred rose from the dressing-table and looked out by his side in blank surprise. 'Why, Hugh,' she cried, noting both his unwonted tone and the absence of the now customary pet form of her name, 'how *can* you say so? I call it just lovely. Blocking out the view, indeed! Why, it *is* the view. There's nothing else. It's the only good point in the whole picture. I love to see it even in winter—the dear old poplar—so tall and straight—with its twigs etched out in black and gray against the sky like that. I love it better than anything else at Whitestrand.'

Hugh drummed his fingers on the frosted pane impatiently. 'For my part, I hate it,' he answered in a short but sullen tone. 'Whenever I come to live at Whitestrand, I shall never rest till I've cut it down and stubbed it up from the roots entirely.'

'Hugh!'

There was something in the accent that made him start. He knew why. It reminded him of Elsie's voice as she cried aloud 'Hugh!' in her horror and agony upon that fatal evening by the grim old poplar.

'Well, Winnie,' he answered much more tenderly. The tone had melted him.

Winifred flung her arms around him with every sign of grief and dismay and burst into a sudden flood of tears. 'O Hugh,' she cried, 'you don't know what you say: you can't think how you grieve me.—Don't you know why? You must surely guess it.—It isn't that the Whitestrand poplar's a famous tree—a seamark for sailors—a landmark for all the country round—historical almost, not to say celebrated! It isn't that it

was mentioned by Fuller and Drayton, and I'm sure I don't know how many other famous people—poor papa knew, and was fond of quoting them. It's not for all that, though for that alone I should be sorry to lose it, sorrier than for anything else in all Whitestrand. But, oh, Hugh, that *you* should say so! That *you* should say, "For my part, I hate it."—Why, Hugh, it was on the roots of that very tree, you know, that you saw me for the very first time in my life, as I sat there dangling my hat—with Elsie. It was from the roots of that tree that I first saw you and fell in love with you, when you jumped off Mr Relf's yawl to rescue my poor little half-crown hat for me.—It was there you first won my heart—you won my heart—my poor little heart.—And to think you really want to cut down that tree would nearly, very nearly break it.—Hugh, dear Hugh, never, never, never say so!'

No man can see a woman cry unmoved. To do so is more or less than human. Hugh laid her head tenderly on his big shoulder, soothed and kissed her with loving gentleness, swore he was speaking without due thought or reflection, declared that he loved that tree every bit as much in his heart as she herself did, and pacified her gradually by every means in his large repertory of masculine blandishments. But deep down in his bosom, he crushed his despair. If ever he came to live at Whitestrand, then, that hateful tree must for ever rise up in mute accusation to bear witness against him!

It could not! It should not! He could never stand it. Either they must never live at Whitestrand at all, or else—or else, in some way unknown to Winifred, he must manage to do away with the Whitestrand poplar.

IN THE GARDEN OF ENGLAND.

It lies asleep, this beauty-spot of mine, in a far corner of fair Kent; and when you pass out of the shingle-roofed cottage on the hill and linger by the skirts of the wood, there opens before you such a prospect as Fancy, with half-closed eyes, might love to picture. I am standing on the velvet ridge of Harbledown, close by the time-stained almshouses which in the olden days gave shelter to the hapless leper. You may still see the high casement from which was wont to swing the opened wallet that pleaded dumbly for charity from the passers-by, from the pilgrims on their way to the shrine of St Thomas à Becket down in the hollow yonder. They are alike at rest now, pilgrim and suppliant; but the shrine remains, and we ourselves are but pilgrims of a later day. Nor can you rid yourself of the subdued emotions which the place and the prospect inspire. It is the same scene which greeted the eyes of those long-past travellers with staff and scallop-shell, after their self-appointed toils. Here are only images of rest—gleaming meadows with slumberous cattle in their midst, such as Sidney Cooper (the English Cuyt) delights to paint; golden mazes of the hop-vine; and gently undulating groves, that here and there open out into cool green glades and give glimpses of distant cottage roofs or church spire. There are here no rude manifestations of nature—no brawling streams or rugged rocks, or shaggy undergrowth

or dense wood. In this spot the north wind has long forgotten to blow. The wind that comes in from the far-off sea where the white cliffs are for ever gleaming is the softest of zephyrs, that scarce stirs the rose-leaves, and only whispers now and again in the long sedge-grass. And as you descend the hill, your way lies through ripening orchards and scented copses where the filbert and the hazel grow.

It is high noon, and the stillness is profound as you pass in under the overarching orchards with their carpets of softest turf. It is the silence as if of some vast cathedral, whose 'long drawn aisles' and fretted columns are here reproduced in the twilight vistas beneath the trees. Now and again come a faint rustle and twitter: it is the little brown birds that are clinging close to the darkened boughs. Just now they are songless; but when great Orion begins to slope westward and the leaves to play in the afternoon breeze, they will take up the thread of their song.

It is thus you go onwards towards Canterbury, through gardens of fruit and across rich spaces of meadow-land, past ivy-clad churches, and red-tiled cottages half smothered by the clinging embrace of jessamine or honeysuckle, with the river Stour gleaming in front like a silver ribbon, and the great towers of the cathedral standing solemnly against the sky. And there is its great clock, too, and its pendulum, which is for ever swinging, and saying:

For ever, never;
Never, for ever.

You can almost hear, distant as you are, its silver-tongued bell. To come upon it in this fashion is like a prelude of sweet music; it attunes the mind to the place and its surroundings. If you care, however, you may dash into the ancient city at express speed, either by the London, Chatham, and Dover, or the South-Eastern Railway, in little more than an hour after leaving London; and in half an hour more, with guide-book in hand, you may 'do' all the principal sights in the place. But such methods are only fitted for the soulless being who would visit Jerusalem as a Cook's excursionist, or get himself personally conducted through the Vale of Tempe, or play skittles on the Pyramids. The quiet old city does not lend itself to such treatment. Therefore it happens that after the shrieking train has disgorged its human load, a very short time suffices to satisfy the ordinary sightseer. A hasty scramble through the cathedral, and a beefsteak at the old *Rose*, added to the purchase, perchance, of a shilling set of views—these are the pleasures which suffice most tourists until the train is ready to whirl them somewhere else, leaving the place once more to quietness and to me. Let such people, so far as Canterbury is concerned, go stay at home. It has no charms for the great army of professional sightseers. Its charms of sentiment and association cannot be weighed, measured, and duly labelled. They reside, mayhap, in the crumbling stones of an old ruin; in the battered front of a quaint gateway; in the note of a distant bell, or the 'coo' of an amorous or complaining dove; the subdued quiet of the street, the old-fashioned gardens, the sweet air, the calm river, the all-pervading restfulness of men and things. These be its

charms, and so they vary with the passing mood of the pilgrims: let the brand-new tourist pass on his clattering way.

If this be your mental attitude, then England holds for you no more congenial haunt. It is a straggling town of one street, long and narrow, with curious little lanes branching off on either side into still quadrangles or leafy solitudes, where you may muse throughout a summer day and be a better man for it. Or you may mount the ruined city wall and linger among the remains of early Christian times, undisturbed save by the solemn music of the chimes; for it is a city of many churches. Chapels, too, it has; but the modern spirit rests upon them, and they chime not except on the Sabbath. There, half-way up the main street is Mercery Lane, leading and pointing like a crooked arm right up to the door of the cathedral. Take off your hat, my friend. Dan Chaucer has been here before you with his attendant train of pilgrims. You have but to shut the eye in order to conjure up vivid visions of the old England which the courtly and passion-steeped *trouvreur* has pictured for us with such magnificent art in the *Canterbury Tales*. It requires no effort of the imagination, as you stand in this quaint alley with the sad and beautiful wrecks of time about you, to reconstruct the gorgeous procession of our English Froissart. There is the Wife of Bath, merry, impudent, droll, and *dégagée*—very *dégagée*; and the Knight and the Miller and the Clerk—all of them breathing types of the dead middle ages, the fine old time of 'ruggin' and rivin'.' Across the open space, over the way, a leap of the imagination carries you back to the landing of St Augustine and his band of Christian monks. They have come all the way from Rome in order to convert the Angles: men and maidens, blue-eyed and golden-haired, surcharged with the fierce-flowing blood of a Scaldic race as yet but half-civilised. It is high noon, and the time of day is clashed and hammered from the cathedral tower; and in the pauses of the solemn din you hear the intermittent tread of the incense-bearing monks and their exultant shout of 'Alleluia!'

The scene is worthy the recalling: it is that of the introduction of Christianity into Britain, at that time the abode of brave but cruel barbarians. You will scarcely realise the strange beliefs and practices of that far-removed time, standing as you do in the bright summer sunshine of Canterbury with mild and modern accessories about you. If you have touch of Orkney, you shall recall, as you take in the charms of the premier cathedral in the world, the immemorial fabric of St Magnus, looking with stony glare into the 'still vexed' ocean. Not that there is any resemblance, any suggestion of similarity, between the two structures. The one stands in the garden of England, in a rich-hued landscape, whereon the vine ripens and the nightingale's note is heard, where the very blood is warmed by the process of the suns; the other stands by the brim of the sea, the centre of a little world of barren slopes, where the shrill scream of the scart and the gannet and the kittiwake replaces the mellow strain of the beautiful bird of night. Yet they are not unlike in those features, in those suggestions, which are inspired

by the contemplation of kindred beauties, of ineffable charms which are inherent in such venerable relics of man's genius and of man's piety—the higher attributes of men here below.

MISS BARKLE'S LEGACY.

CHAPTER III.—THE WIDOW.

'My sister, Mrs Penbury!'

Miss Barkle stood for a moment with the hand she had offered still outstretched. The widow started violently, stared, and swept past her with an almost imperceptible bow. John Brawn looked after his sister in amazement; whilst Miss Barkle took one step towards him with extended arms, and, with a low cry, fell fainting at his feet before he could save her. Mrs Penbury, turning as she reached the stairs, faced the group in the hall, pale but collected.

'That is the name I could not remember,' she said to her brother in a calm steady voice—'Miss Barkle.' She cast a glance at the prostrate figure, bowed slightly to Annie Carston, and continued her retreat up-stairs, as John Brawn, in astounded silence, raised the senseless lady in his arms.

He carried her into the dining-room, and leaving her with Annie and the servants, followed his sister. She had informed him of what she described bitterly as a most extraordinary, an utterly unaccountable bequest by her husband to a woman she had never heard of before the will was read, and whose name she had forgotten, or affected to forget. Now, the advertisement which had so excited Midport curiosity recurred to him, and he saw what he had done. He had unwittingly brought his sister in contact with the one woman on earth she would wish to avoid. Undoubtedly, it was most distressing for them both, but still the meeting itself was hardly sufficient to account for the effect it had produced on Miss Barkle. That seemed to require explanation, but the present was not the time to ask for it.

He found Mrs Penbury outwardly composed, but in a state of suppressed excitement, such as he felt was only to be expected. She turned questioning to him as he entered, but did not speak.

'If you had only told me the name of the woman George left the money to, you should not have undergone this, Nora,' he said.

'Where is she now?' asked his sister quietly.

'Down-stairs, in a dead faint. Miss Carston and the maids are with her.'

'You might go down and see how she is, John; I must see her before she leaves.'

'Not to-day, Nora: spare her just now; she has been awfully upset,' he urged.

Mrs Penbury looked at him for an instant before she spoke; when she did, her voice rang through the room in tones that boded ill to the unhappy Miss Barkle if an interview took place between them then.

'Spare her!—Then, is this nothing to me?' Her lips moved silently as she motioned to him imperiously to go; and he left the room bent on getting Miss Barkle out of the house as quickly as possible.

She had recovered, but sat in a dazed dreamy condition, as though she heard and saw nothing around her.

John Brawn went forward and took her hand. 'I have sent for a cab to take you home, Miss Barkle, as soon as you are able to go.'

His voice roused her; and as she looked up at him, it crossed his mind that if he could learn particulars of this wretched legacy business from her, it might satisfy his sister. It would never do to bring the two face to face again to-day—neither was equal to it. So he sat down, and cautiously approaching the subject, drew from her all she had intended to lay before him after her visit to Lambton and Warder. It was a long rambling story as she told it; but he waited patiently until she finished speaking and gave way to tears.

'Then, after the date you mention—sixteen years ago now—you never saw my late brother-in-law?' he asked.

'Never. I never saw him again after I—I refused him,' sobbed the unfortunate lady.

'Nor heard from him?'

'I didn't even know whether he was alive.'

John Brawn paused for a moment; the matter was repugnant to him; but he wished to get it over once for all, now he had entered upon it. 'Well, I won't trouble you any further,' he said, rising. 'I'll come over, or write as soon as there may be anything to tell you.'

He accompanied them to the door, detaining Annie, as Miss Barkle passed out. 'Try and come over to us this evening,' he whispered.

Miss Carston nodded, and followed her friend, who had relapsed into her former state of passive apathy, and seemed incapable of understanding the simplest remark.

Her mind was busy with the one thought—that John Brawn was separated from her for ever. The process of reasoning by which she arrived at this conclusion was simple: Mrs Penbury was his sister; Mrs Penbury was her enemy; ergo, Mrs Penbury created a hopeless breach between them. This conviction had come upon her with all its force when he had introduced her to the widow, and she had instinctively turned to him, when she fainted.

Annie Carston drew her own inferences from what had passed, and in doing so did not go far wrong; but Miss Barkle required all her attention at present, for she was shaken and unnerved. They reached home at length, for they had not waited for the cab; and Annie persuaded her to lie down, whilst she darkened the room, and sat with her to prevent her being disturbed. How the Midport people would talk when they heard of this new development of the story! Annie wondered what bearing it would have on her friend's prospects: the widow was a handsome woman of about eight-and-twenty, tall and dark, with a masculine firmness of expression indicative of her strength of will; a great contrast to the meek Selina Barkle; and Annie hoped, after what she had witnessed, that it would not lie with Mrs Penbury to give up or withhold the legacy. She knew as little about law as the majority of her sex at the age of nineteen, and the repeated discussions she had listened to lately had left her under the impression that if the widow refused to surrender that ten

thousand pounds, Miss Barkle had no remedy. But that did not seem to be right somehow; she would ask John Brawen about it.

What a curious confusion the affairs of her few intimates were in. To begin with the eldest: there was Captain Mulbane deeply enamoured of Miss Barkle, who didn't care for him; Miss Barkle warmly attached to John Brawen, who didn't care for her; Mr Brawen in love with Annie Carston, who *did* care for him very much. 'Now, if only I liked Captain Mulbane instead of Jack,' she thought, 'the tangle would be complete; but I'd rather have it as it is.'

She rose and went to the bedside. Miss Barkle was dozing, but her hands were hot, and she had a feverish look. Annie left the room softly and went out into the garden. There was no cause for anxiety yet; but if she was not all right by the evening, she would call in the doctor. She had not had much experience of invalids, and did not like the responsibility of being alone with her friend in her present plight. She was leaning over the little gate, idly watching the cattle on the common across the road, when she became aware of the vicinity of a man drawing near with a stealthy circumspect gait, as though he feared being seen. It was Captain Mulbane, who had been hovering about the cottage all day. Observing that Annie was alone, he took courage and came forward.

'How do you do, Captain Mulbane?' she said. 'Why, has anything gone wrong?'

Her question was amply justified by the stout gentleman's extraordinary grimaces at the cottage and herself alternately.

'Has he gone mad?' she thought in consternation.—'What is it, Captain Mulbane?' she continued aloud, drawing back from the gate a little.

The gallant officer's visage was rapidly assuming a deep purple tint, which gave additional variety to its contortions as he bent over the gate whispering hoarsely: 'I won't tell a soul a word about it, Miss Annie—not a soul, not a word.' He drew back, and his features expanded in a grin that was positively refreshing in its intelligence after his previous facial antics. But what did the man mean?

'Won't you come in?' she said. 'I'm afraid I don't quite understand you.'

'O no, Miss Annie; I couldn't think of coming in yet,' and the captain recoiled hastily, as though he distrusted his own power to decline the invitation.

'How is—is *she*, to-day?' he asked with a sigh, edging up to the gate again.

'Not very well. Something has upset her; but'—

'I knew it; I felt it! I was sure she would catch cold, Miss Annie,' and he almost wept as he spoke, 'sitting there with her feet all wet, you know, and it was my fault too.'

What, in the name of mystery, was this new complication? Captain Mulbane evidently held himself accountable for something which had resulted in wet feet for Miss Barkle, and was causing him genuine distress.

'If you will wait a minute, I'll come out with you,' she said, and ran into the house for her hat; whilst the captain, hidden by the laurels, wistfully scanned each window in turn for a glimpse of his

lady-love. He had been unable to restrain his longing to see Miss Barkle and assure her of his intention to be silent regarding their meeting on the sands; but his heart failed him, and he waited about, trusting that fortune might bring him in her path. Seeing Annie Carston alone at the gate, and never doubting but that she knew the secret, he had deemed no preliminary explanations necessary when he confided to her his resolve 'not to tell a soul,' supposing she would not fail to inform her friend.

The blind of the drawing-room window was suddenly drawn up as he watched, and fearful of discovery, the captain turned and fled. He was out of sight when Annie Carston reappeared two minutes later; and after looking all round the garden for him, she felt that the only conclusion any one could come to was, that the old gentleman was indeed off his head. 'Sunstroke, I daresay,' mused Annie as she started in the direction of Lansdale House; 'but I hope he'll be all right before he calls again.'

She met John Brawen at the gate, and they went in together to the library. 'I expect my sister will be down directly,' he said, as he closed the door. 'I'm going to introduce you to her as my intended wife, if you've no objection.'

That she had none was manifest by her mode of acknowledging the matter-of-fact statement, which seemed perfectly satisfactory to 'Jack.' What followed would not interest us, and we may pass over their conversation, touching only on those points which relate to our story.

'What do you think Lina Barkle told me the other day, Jack?' said Annie.

'Don't know, I'm sure.—What?'

'She was quite certain you were going to propose to her before long,' and Miss Carston tried to repress a giggle.

'Where on earth did she get that idea?—Are you sure she didn't mean Mulbane?'

'Of course I am, stupid boy. But had I not better break the truth to her now?'

'I can't comprehend what put the notion into her head,' said John Brawen, who was by no means pleased at Miss Barkle's fancy. 'But you'd best tell her you're engaged to me, or that I am to you, however you like to put it.'

'The poor thing was awfully cut up by what happened this morning.—Do you think your sister will give her the money, Jack?'

'It doesn't rest with her, Annie. She might keep her out of it for six months; but she hasn't a leg to stand on if she carries the case into court.'

'It would make a tremendous difference to Lina,' said Annie thoughtfully.

'You see, child,' said Mr Brawen, 'it's a terrible blow to a woman to find, as Nora has, after her husband's death that another has held such a place in his thoughts all those years. One can't expect her to regard Miss Barkle with very warm feelings, you know.'

'It wasn't her fault,' was the womanly answer.

'No blame attaches to any one, unless to poor George, in making such a bequest after he had actually married.'

'What had Lina better do now, Jack?'

'She can't do anything. Thank Heaven, Nora's concerns aren't in my hands!' said John Brawen

devoutly. Perhaps, had he known that his timely absence from Midport had saved him the unpleasantness of being asked by Miss Barkle to champion her cause against the unknown widow, he would have been still more grateful. He had gone to his sister after the two had left that morning, and had told her everything he had ascertained. Nora Penbury was not a vindictive woman; but, as her brother said, it had been a terrible blow to find that some unknown love had held a place in her husband's heart throughout their short wedded life of three years. With even, unbroken harmony that life had run, without a discordant note in its brief but happy span; and the legacy had given the widow a shock which deadened the keenness of her sorrow. Now at the end, Fate, dealing its shafts with both hands, as is its wont, must bring her face to face with the woman herself ere her widowhood was ten days old. Blameless she believed Miss Barkle to be, for, amongst her husband's letters, she had found nothing for suspicion to feed upon. Still, nothing could shake the glaring truth, so rudely brought home to her; and she could not persuade herself to let this long silent rival receive such a mark of her own husband's love unchallenged. She had lost no time in taking steps to prevent the executors proving the will; and though the delay might inconvenience herself, she would not remove the legal obstacle she had raised before she could help it.

The solicitors had concealed from Miss Barkle that Mrs Penbury had actually objected to their taking out probate of the will, trusting in their ability to convince her of the futility of the step.

John Braven and Annie were still engrossed with one another when Mrs Penbury joined them. She had heard something of the young lady, and received her with a gentle kindness, so different from the callous manner she had worn before, that Annie began to hope the difficulty might not prove so serious after all.

John Braven left them together after a few minutes; and Mrs Penbury devoted herself to learning all she could regarding her brother's fiancée: how she had known him since she was fifteen years old; how her father died six months after his second marriage, leaving her to the care of a step-mother, who made life at home intolerable; and how Miss Barkle had taken her in and— But here Annie checked herself, feeling she trod upon delicate ground.

'Go on,' said the widow. 'You were saying how Miss Barkle had given you a home. Have you been with her long?'

'I have almost lived there since my father died; but it was only a few days ago that I went to the cottage altogether.'

'Is she a wealthy woman?'

'No; has a bare living, I should think. But she is wonderfully good to me, as she is to everybody,' said Annie warmly.

Mrs Penbury sat silent for a while. When she spoke again, her companion was startled by the change from gentleness to firmness in her tone. 'You know how I stand towards your friend,' she said.

'Jack told me all about it to-day,' said Annie, feeling uncomfortable, and wondering what was coming next.

'I believe the solicitors found her through an advertisement?'

'Yes. She couldn't think what it meant when she saw it that morning.'

'What did she do about the news when she heard it?'

'She was going to ask Jack to do everything for her, but he was away when she came back from London.'

There was an air of authority about the widow that seemed to compel Annie to answer whether she wished to or not; and now, thankfully finding there were no more questions to reply to, she began to think over the answers she had made, dreading lest anything she had said might injure her friend.

Whether Mrs Penbury had more to ask we cannot say, for John Braven's return caused the subject to be dismissed. His sister dropped the magisterial manner she had so suddenly assumed, and by increased kindness appeared desirous of removing any impression it had made on the young lady.

We have said that she believed Miss Barkle innocent of having held any correspondence with Mr Penbury; but though this was the case, she could not resist the chance of probing for fresh evidence to prove it. She had certainly learned little from Annie Carston, but that little supported what she had heard through her brother.

Miss Barkle's indisposition compelled Annie to return to the cottage early, and she accordingly left soon after her talk with Mrs Penbury, escorted by John Braven. On the way they arranged that the duty of announcing their engagement should be left to Annie's discretion, for Miss Barkle had been in so nervous a condition since the morning that it might be inadvisable to inform her of it just yet. The news would not do much to cheer her, after the hopes she had cherished regarding Mr Braven.

Their well-meant plans, however, were foiled by the person for whose benefit they had been made. John and Annie were busy saying good-night at the gate—and it is remarkable how long it takes two young people so circumstanced to accomplish that simple ceremony—when Miss Barkle, who had awakened from a long sleep more composed, came upon them unobserved. She took in the position at a glance, and accepted the revelation with fortitude, turning away unseen. She had been prepared to see him irrevocably torn from her; that was inevitable. But surely he might have waited a little while, only a little while, before seeking consolation in the arms of another. It was heartless and cruel to do so the very day he saw the impediment his sister's presence raised; it was mean-spirited, despicable; and if Annie Carston cared to have the love of a man so easily led away, she might. She would forget him; he was not worthy of another thought. Thus she tried to reason within herself; but she was not convinced. John Braven was not the man to do such a thing under impulse; it was utterly opposed to his nature, and it was impossible to believe it of him. Then there was but one alternative, and Miss Barkle's heart swelled as it told her that it was the true one; Captain Mulbane had been right yesterday, and those almost daily visits had not been made to see her. She had been deluding herself with an

unfounded dream. How blindly she had pursued her fancy to the bitter end! Poor Miss Barkle. Vanity is a pleasant guide for a time, but how rarely it leads us to the goal it seemed to promise!

If only she had left those foolish words unsaid that evening. She flushed hotly as she thought how her friend must have laughed in her sleeve. She had been sadly mistaken, and would own it at once. Better now, whilst Annie's great happiness was at its zenith, than later; she would not think much about the weaknesses of others to-day.

'Let me congratulate you,' she said coming to the door to meet the young lady, with a successful effort to speak sincerely. 'Oh, I saw you at the gate,' she went on with a laugh at Annie's look of guilty surprise. 'I know all about it, so you needn't say another word.'

With a feeling of gratitude for the accident that had made Miss Barkle a witness of the parting with her lover, Annie received her caresses; it had saved her the unpalatable task of enlightening her friend.

'Was Captain Mulbane here to-day?' she asked, after her engagement had been talked over. 'I don't suppose he was, though,' she continued, recalling his refusal to come in. 'He was perfectly mad in the way he went on—knew something he would not tell a soul, he said; and was sure you would be ill to-day because of your wet feet. Have you any idea what he meant, Lina?'

Miss Barkle shuddered visibly at the recollection. 'He caught me wading yesterday, Annie,' she said, 'and sat down beside me; and, O Annie, I thought he would *never* go away.'

Some few questions were necessary to elucidate this incomprehensible statement; but the eccentricity of the captain's conduct was eventually explained. 'And, O Annie,' said Miss Barkle again, 'I *do* hope he will hold his tongue.'

RELATING TO CRYPTS.

THERE has been a crypt below Bamborough Church for many centuries; but, curiously, in the last century it was used only as a burial vault, and closed. In that capacity it was of course but seldom visited; and at last the external approach to it in the churchyard was covered up with the whirling drifting sands, and then the place was forgotten. Within the memory of many of the present inhabitants of the breezy, bosky, wide-spread village, it was found again. The flooring of the chancel was removed, and a flight of stone steps observed. On descending them, it was ascertained they led to a long narrow chamber, dimly lighted at the east end by a small window, on the south side of which a doorway gave access to a second chamber of the same length as the first, but of twice the width. This larger chamber, or chapel, has a groined roof of two bays, and two deeply splayed window-openings at the east end. It has also traces of an altar and a piscina, and in the centre of the groining is a staple, from which evidently a lamp once depended. It has also a doorway on the south side opening into the churchyard, which, at the time of the discovery

and examination mentioned, was blocked up with sand and hidden from sight.

The earliest crypts were hewn out of rocks, or built of masonry below the soil, to receive, and conceal from profane eyes, the remains of martyrs. Subsequently, chapels, and eventually churches, were raised over them; still later, crypts were formed below new churches for the special conservation of relics and the devotions of those who visited them. The most ancient are little more than square vaulted chambers with but the sparest architectural ornamentation. Later examples are veritable subterranean churches with grand aisles, formed by low and massive arcades of columns. Most of them are provided with two ways of approach, or exit, that pilgrims might descend in procession, or otherwise, conveniently, and proceed onwards and outwards without turning back and causing confusion. One of these approaches nearly always consists of a set of stone steps descending from the choir or one of the transepts; and the other nearly always opens out into the exterior surroundings of the edifice below which the crypt is situated. There are of course occasional variations from this plan, especially on the Continent, where crypts were more frequent in former ages than they were in this country. Sometimes, for instance, there are two approaches from the interior, and in one familiar instance (at Dijon) there is a circular crypt. The usual construction, however, provides for a stream of persons descending from the interior of the fabric, viewing the relics in the martyrdom, and then ascending to the level of the surface of the ground upon which the superincumbent edifice is erected.

Into this little dim crypt below the chancel of Bamborough Church, therefore, we may picture to ourselves the olden inhabitants of the district—many a good man and true, many a fair dame and dainty damsel, besides long lines of pilgrims—groping their way down the stone steps, after some preparatory service in the church. We may imagine, also, their intensified sense of the potentiality of the blessings of life and light and air, when, at the conclusion of their devotions, they emerged through the outer doorway into the churchyard, whence the great ocean, the stupendous castle on the high rocks close by, and the wide adjacent country, were reassuringly apparent.

There is a curious crypt, too, in Hexham Abbey Church. This is of Saxon workmanship. It has three entrances: one for the priest, the others for the descent and ascent of worshippers. On descending the steps leading to it from the interior of this superb edifice, the Saxon worshipper found himself in an antechapel, from which he could pass into a larger chapel containing the relics and an altar. The larger chapel measures thirteen feet three inches from east to west, and seven feet nine inches from north to south. Three niches with funnel-shaped headings mark the places where three lamps were placed to light it. In like manner there is a similar niche in the outer chapel for the same purpose. The door-heads are all semicircular, including that leading to and from the antechamber at the foot of the steps used by the priest. An arresting feature in this hoary cell is the occurrence of several Roman stones in the masonry, which have evidently been

used up by the Saxon builders, as being suitable for their purpose and near at hand. A portion of a Roman altar serves as a lintel over one of the doorways, and has been tooled into a semi-circular form; and a square tablet with a dedicatory inscription upon it, and several fragments of ribbed ornament, may be seen built up in the walls. Richard of Hexham describes this church as having been built by Wilfred in the seventh century, in three stories, supported by columns, and mentions that innumerable multitudes might stand around the body of the church and yet remain unseen by those within; and that Acca, the friend of the Venerable Bede, collected the remains of saints from all parts of Europe and placed them in shrines between the pillars; and made it so costly with sculpture and painting, and the services so rich with singing, vestments, and vessels, that it was finer than any building on this side of the Alps. The crypt, we may thus conclude, has heard the reverberations of the sacred music of Acca in the choir above, and from that distant time through many centuries has been hallowed with the resolves of countless penitents, and the aspirations and supplications of myriads of souls.

Below Repton Church, in Derbyshire, there is another Saxon crypt. It is about seventeen feet square, and has a vaulted roof, and four columns with wreathed shafts and plain square caps and round bases. This crypt was also built with three entrances, whereof two were in the church above, and one on the north side of the exterior. A king's daughter was abbess of Repton in 874, we are told, when the Danes wintered there. It is supposed they did not leave the church scathless; but the crypt may have been unknown to them, and thus escaped destruction; or the royal abbess may have prevailed with them to leave it untouched.

Many of our cathedrals possess crypts, though not all. Below the central tower of Ripon Cathedral, deep in the earth, is a massy stone cell, called St Wilfred's Needle, approached by a narrow passage forty-five feet in length. This is also extremely ancient. The crypt below York Cathedral is of late Norman workmanship and of very large extent. It is beneath the choir, and is approached from both sides of it. There is a deep draw-well in it and a lavatory. The largest crypt at Durham has ten massive columns, forming twenty noble bays, very reverberative and solemn. This is beneath the dormitory. There is a second crypt under the refectory, and a third under the prior's chapel. Glasgow Cathedral has a fine crypt. But perhaps the finest example of all is that under Canterbury Cathedral. This superb structure, called the Undercraft, was allotted to the Walloons by Queen Elizabeth, who made use of it to industriously carry on the art of silk-weaving. The Westminster crypt is also a very noble specimen of the ancient masons' craft.

Sometimes crypts are below chapter-houses; this is the case at Wells, where there is a fine specimen with a groined roof. The chapter-house proper did not attain its full height till so many years had elapsed that quite a new style of building was in vogue, lighter and more graceful in every way, with yearnings towards the delighting tracery-work that was afterwards everywhere

adopted, albeit the masons in the crypt had contented themselves with the old dog-tooth ornamentation. There is a crypt under the chapter-house at Ripon, too, besides St Wilfred's Needle under the tower. It is called the Bonehouse, from the fact that the walls and recesses are lined with skulls, &c., arranged with the same curious neatness as the bones of the ten thousand virgins in the church of St Ursula in Cologne.

The *New World of Words*, published in the reign of William and Mary, gives us the following information under the head of *Cryptæ*: 'The graves of the martyrs were more especially so called, where the primitive Christians used to meet for the performing of divine service; whence *crypta* came also to signify a church under ground, like that of St Faith's under St Paul's.'

NUMBER 263.

A TRUE STORY.

'BE off with you and your tract!' It was a prisoner who spoke these words with an angry gesture, and the voice that gave them utterance rang with a peculiar harshness.

I was only a young man in those days, fresh from the university, and sadly wanting, I fear, in the tact which experience gives in later years to men who follow the sacred calling of the priesthood. My old friend, Mr —, who was chaplain to — convict prison, had been attacked by fever; and being a devout and earnest man, full of energy, and with his whole heart in his work, and unwilling that his duties should remain unfulfilled, had asked me to take his place in the prison until he was again able himself to visit it. That is how I came in the first instance to minister to the wants and necessities of the criminal classes. So serious did my friend's illness prove itself to be, so uncertain his recovery, and so long the period of his convalescence, that I was left for close upon a year in the performance of the prison work. You may imagine that during that period I met some strange characters, saw some strange sights, and heard some strange stories.

What a funny world it was—a world within a world, and peopled by the dregs and scourgings of humanity. What ferocious instinct, brutal hate, and savage fearlessness were there; what mean distrust; what petty jealousy; what wizened battered faces; what wrecked and loathsome bodies. What moral rottenness pervaded and leavened the bulk of these unfortunates. It was curious, too, to note the rigour with which certain points of prison etiquette were observed, and the manner in which a species of classification was arrived at by the prisoners themselves.

It would be no difficult matter, indeed, to write a paper interesting enough in detail concerning the inner life of a large prison from the convicts' point of view. To the spotless passer-by who has never transgressed the nation's laws, and whose acquaintance with the prison is limited to a view of its gate as he passes it by, it may

seem that there is little difference indeed between most of the jail-birds who congregate within; but if this is his opinion, it is by no means shared by his less fortunate fellows. There are in every prison at least three classes of society, constituted, be it remembered, by the prisoners themselves, and rigorously recognised. The third or lowest class consists of common drunkards, ordinary vagrants, wife-beaters, and such-like; and these are the despised and rejected ones who come in for abuse and vilification, and are considered unworthy to consort with their 'better' brethren. The second class consists of such gentry as sneak-thieves, petty-larcenists, and cattle-thieves, who consider the wife-beater and the drunkard too low to associate with; but who are themselves in turn beneath the contempt of the first-class swells, who are bank burglars, adroit pickpockets, and life-sentenced murderers; always provided, in the case of the last mentioned, that they are not wife-poisoners, a set of men who even in prison are not tolerated, although why a distinction should be made in the case of any deliberate murderer seems incomprehensible. There is always also the 'bad man' of the prison, a curious appellation, surely, where all are supposed to be bad. It is about the 'bad man' of the prison I am writing this sketch. I found his name in the prison register after this fashion: 'MURTON, JOSEPH, No. 263, Wing D, Tier 4;' and opposite the entry in the book was the word 'Incorrigible' in large red-ink letters. There had been other men similarly indexed, as I could see by the red affixes to their names; but all of them had passed out to other prisons or to the busy world again. Joseph Murton, strange to say, was the only incorrigible (according to the books) in the institution.

Why he was bad, no person knew. The keepers feared him, the governor hated him; he was continually in hot-water, and as often in as out of the dark cell. He had been flogged more than once for insubordination, and, as far as could be judged, was a prison Ishmael. And yet there were some soft spots in his heart—the hospital orderlies knew that; for once or twice, when he had been ill and thrown into contact with sufferers sicker than himself, his gentleness and patience knew no bounds. The choicest morsels of his rough food were always laid aside for them; his voice as he read aloud to them was actually musical; and through the long night vigils he was the watcher who sat and whispered soothing words, or moistened lips that had grown hard and dry with suffering. His cell was a model of neatness: not a mark could be detected on its snowy walls; no bed was ever so neatly folded as his, no tins so brightly scoured. In person he was scrupulously clean, and seemed to take a pride in the respectability of his appearance. In the workshop—he was a broom-maker—his work was generally performed more neatly and more quickly than by any of his gang. On one occasion, when a keeper had been terribly wounded and well nigh killed by a mob of mutinous prisoners, Murton had stood boldly up in defence of the officer, and had been severely wounded himself for his pains. In spite of many such good qualities, his uncertain temper, despondent moods, and blind unreasoning ferocity, kept him in perpetual trouble, and at the time

I write of he was certainly the 'bad man' of the prison. Now, it was a fit of sullen perverse obstinacy; now, a flat refusal to perform his workroom task; again, a refusal to obey some simple rule at other times cheerfully obeyed; and still again, a savage attack upon a fellow-prisoner or keeper. He was a strange creature Joseph Murton, with a strange history, as you shall hear.

I was informed one morning by the librarian, also a prisoner, that a man was to be flogged that day for an assault upon one of the officers. I have already confessed that I was young, and a curious desire to witness such a scene, although clearly no part of my duty, came over me. To acquaint the governor of my desire was but a matter of form; and ten minutes before the big bell tolled twelve, I was in the courtyard, where the triangles used for whippings were already raised. Five minutes later, the prisoners were marched in to the goose-step, and shuffling along with furtive glances, took their places, forming three sides of a square. I was told afterwards that their presence there was not only for example's sake, but in order that there might be no feeling in their minds as to excess of punishment. The keepers, in full force and heavily armed, were of course present; and as the clock struck, the governor and surgeon appeared. Two of the keepers, both old soldiers and adepts in the use of the 'cat,' stepped up to the triangles with their torturing little instruments; and next moment, stripped to the waist, but with a coat hanging loosely over his shoulders, came the victim, Joseph Murton. Where was his boasted strength, ill temper, mad ferocity? He walked as gently as a child, and a half-smile flickered on his lips as he held his hands out to be bound. I am not going to describe that morning's work, as I still remember it; it was the only flogging I ever saw, and I wish I had never seen it, for even now it makes me shudder to recall it. A hundred lashes was the sentence; and a hundred lashes means a million tortures to the flesh, and agony to the soul of any man. But Joseph Murton took his flogging without a murmur or a groan, although his face grew deadly white and his lips were bitten till they bled. He laughed; yes, he actually laughed out loud when he was untied, and put on his coat himself, although hardly able to move, so bruised and lacerated was his back; but as he passed the keeper who had reported him and caused his stripes, there came an angry gleam into his eyes and a quiver into his nostrils that spoke no good; and it was well on all sides that he was hurried away before further mischief was done, for the devil in the man was roused and knew no cringing. He was sent to the hospital to have his wounds healed, and it was there I first made his acquaintance.

I made a point of visiting all the Protestant prisoners regularly in their cells, and as Murton had described himself as an Episcopalian at his admission, I had repeatedly tried to hold some conversation with him; but all in vain. In spite of the friendliest advances on my part, he preserved a sullen silence, and would invariably turn his back on me if I approached his cell. On one occasion, when he had evidently heard my voice in his neighbourhood and expected a visit, I found

a neat paper notice hanging on his bars with the following inscription: 'Cell No. 263—4th September 18—.—Book pedlars, insurance agents, clergymen, and other nuisances, not needed to-day.'

There was something about this man, however, that instinctively drew one to him, for I felt sure that, in spite of all appearances, there was good in him. The day after he had been flogged, I saw him in the hospital. It was a Sunday; and I had held a brief service with the sufferers, and at the close presented each with a tract, according to my usual custom. It was this, when I came to him, that called forth the angry words I have quoted at the commencement of this story. It took many a long day to soften that hard heart; but at last I won his confidence. Little by little I came to know more of the man, and found, beneath the rough and rude exterior, deep feeling and a broken heart, that accounted for the recklessness otherwise hard to understand. In fact, despair was gnawing at his heart, and the daylight of his life had been quenched for ever. He got to trust me sufficiently by-and-by to tell me his story; and here it is:

I don't see much use, parson, in troubling you with my story; it isn't a long one, and there's nothing interesting in it for any one to hear, God knows. I know I'm a young man; and I don't doubt but you fancy I should be doing better than wasting my time in a prison; but the fact is, parson, I don't care what becomes of me now, for I've lost all heart for everything I ever cared for.—What am I in here for? Attempted murder, they say. I've put in four years for it now, and I owe the Queen six yet.—What was it all about? I can't tell you that myself; I couldn't explain it to the judge, and the jury wouldn't have understood it either. I was always a wildish chap, parson, though I had never harmed a living soul, that I know of.—Occupation? Well, I used to be a printer.—Drink? Yes, I used to drink, and pretty hard to; but I gave that up. I gave up every bad habit I knew I had, for the sake of a girl I loved. No matter who she was or where she came from. If she were here before us now, you would see how blue her eyes were and how sweet her smile; and she would bring back hope and sunshine to me. That girl was a beacon-light to me, and for her sake I turned my back on all my old companions and foolish ways. She was never weary of encouraging me, and the hours flew by when we were together as if they had wings. I loved her better than I loved my own life—better than I loved God. We were to be married soon, and I worked merrily all day, and whistled as I set up the types; soon we would have a cottage of our own; soon she would be my own for ever; soon life would be a long and happy dream. How distinctly I remember all these things now, and how often I hear her voice still!

The time wore on, and at last came our wedding morning, and when the words were spoken that made us one, there was no man on earth who was happier than I. We lived together for a month, and every day seemed far too short. They speak of things being too good to last, don't they? I suppose it was that way with us. She ran down the river one day in a steamer for a breath of fresh

air, and I promised to meet her on her return. She kissed me good-bye so gaily when I left her, and told me that the hours would seem long till we were together again.—There isn't much more to tell now, parson. I was working that afternoon, when the foreman gave me a headline to set up for the evening edition of the paper; it read: 'Fearful Catastrophe;' and as I glanced at it, I saw it was an account of the collision of her steamer with another on the river that forenoon. O God! the anxiety of that moment, the sickening doubt and dread! I rushed to the river, hatless, coatless, just as I left the workroom, and I shouted her name as I ran. The river-front was crowded with people, and I could hardly make my way amongst them; then I was turned back several times by the police, and it seemed as if I would never get near enough to learn the news.

At last I got near the water, and saw that they were bringing bodies to the land in boats close to where I was. 'Have you got my Nelly?' I cried as each load passed me; and the dead faces would be uncovered for a moment, in the hope that they would be recognised. But evening came, and there was no one like her in all the long procession that had passed me, and by-and-by night came, and it became too dark to search any longer or to see. Suddenly the thought flashed across me that Nelly might be at home. Of course that was where she was. She would be waiting for me, and wondering at my absence, perhaps afraid for me. How foolish not to have thought of that before! How fast I ran back. But the little windows were all dark when I got there; and when I opened the door and called her name, there came no answer! I went back to the river after that, and sat there all that night, cold and hungry, and full of despair; and the night-winds must have heard me crying for my Nelly whilst the blinding tears ran down my face.

Early the next morning they began again dragging for the bodies; and by-and-by they found her. Not a bruise or mark or cruel cut upon her, but her face so still and white, her eyes so tightly shut, and her little hands so cold! I remember looking at her as she lay there cold and wet, and I could not think that she was really dead. Would the blue eyes never look at me again and the dear lips never speak? Were the little hands never to lie in mine, nor the willing feet to patter beside me? I *could* not believe it. I went and whispered in her ear and kissed her, and waited to see her smile at me.—Then all the world became dark. I remember trying to throw myself into the water, that I might die too; and I remember fighting like a madman with a policeman who tried to prevent me. I beat him till the blood was streaming from him, and I saw him fall at my feet as if dead; but I remember nothing more. I woke up in a hospital, where they told me I had had brain fever. I don't know how long I lay there; but I recollect being next in a prisoner's dock and hearing a white-faced constable telling the judge how I had beaten and stabbed him without provocation. I looked in vain for words to answer with. What could I say? No judge on earth could understand what I felt; indeed, I hardly knew myself. The verdict was 'guilty,' and the sentence ten years; and that is how I came to be in prison. They think me mad in here; they call me dangerous. But what have I to live for now?

In the midnight darkness, through the workshop noise, in the loneliness of my cell, I see her face, white and cold, and I cry out to her, and long for death to take me beside her. I don't know even where they took her or where her grave is; and if I were out in the world again to-morrow, I wouldn't know where to look for her.—Life isn't worth living now, parson. I know all about your tracts and gospels, but they don't bring me back Nelly. I sometimes think that she isn't so far away after all, for I seem to hear her voice and feel her near me. If she ever sees me, she knows how I miss her, and how black the world has been since I lost her.

That's my story, sir. Next time you see me tied up and flogged, you'll think that Nelly isn't far away, and that her little arms are round me, though no one knows it but myself.

TRUE FAME.

'AND this is fame!' is reported to have exclaimed a well-known politician, when he heard that a letter addressed to him had been returned to the sender, through the Dead Letter Office, owing to the address being rather illegible. He evidently thought that everybody would be familiar with his name, address, and social standing. Life's grooves are indeed narrow; and a man has to achieve a great deal, and keep his name before the public many years, before he is known to 'the general.' Sir Henry Taylor, the gifted author of *Philip van Artevelde*, has placed it on record that 'the world knows nothing of its greatest men;' and the assertion is particularly applicable to the case of contemporary men, because there is too great a tendency to decry the living at the expense of the dead.

The ignorance of judges in this respect is proverbial. Everybody has heard of the legal luminary who said, 'Archer! Archer! who is this Fred Archer?' Considering that some judges have no knowledge of the most elementary subjects (Lord Campbell, who knew nothing of cricket, almost went into a fit when a short, stout witness told him that he was 'long leg'), it is certainly expecting too much to suppose that they should be familiar with the name of a famous jockey or of a living author. In the case of judges, no doubt a good deal of this 'ignorance' is feigned; but in a large majority of people it is perfectly genuine, and this circumstance must have caused a great many persons to soliloquise on the hollowness of fame.

A 'society' woman, at whose table Longfellow was dining, asked him, 'Oh, Mr Longfellow, have you ever published a book?' This was after two-thirds of his lifework was done. Hawthorne says that in his later years he met many people who knew him well as the ex-surveyor of the port of Salem, but who never knew that he had written anything, and had not even heard that there was such a book as *The Scarlet Letter*. Even the genial Autocrat is not appreciated by everybody in his own town. One day an American gentleman went into a barber's shop as Dr Holmes was going out. 'Do you know who that was that just went out?' asked the barber. Being curious to see what account of Dr Holmes the barber would give, the visitor shook his head.—'Why,' said the barber,

'that's old Dr Holmes.'—'And who is Dr Holmes?' 'Oh, he's been a doctor here a great many years. I believe he ain't practisin' any more, but he's thought a good deal of!'

A crushing remark was once made by a would-be flatterer to Mr W. D. Howells, the American novelist. Shortly after the publication of *The Lady of the Aroostook*, *A Foregone Conclusion*, and *Venetian Life*, a lady asked that gentleman for his autograph, whereupon he wrote some impromptu verses in her album. She read them over, and then gave an encouraging smile. 'Oh, Mr Howells,' she exclaimed, 'I should think you might do something for the papers and magazines; I've seen much worse things than that in print!'

When even Dickens and Thackeray met with experiences somewhat similar to this, the smaller fry can scarcely help to escape. Men well known in other walks of life are scarcely less fortunate than the novelist. Take, for instance, the story told by a clergyman, as being part of a conversation held by him with an Englishman to whom he pointed out General Grant's residence in New York. The Englishman asking, 'What name?' and seeming to obtain no further light, the clergyman repeated it to him, and said: 'Of course you have heard of General Grant? He was our President for eight years, ending in 1877.'

'Ah!' remarked the Englishman, still with no evidence of recalling a fact previously known.

'Then, too,' proceeded the clergyman, 'he was a great general, and was in command of a million of men at the close of our war. You remember our late war, of course?'

'Well, no,' was the answer. 'Beg pardon, but I have just arrived in this country, and was so long at sea that I have not heard the latest news. I was at sea sixteen days, really!'

This gentleman was scarcely abreast with the times, and his ignorance reminds one of Mark Twain's famous question to a railway-carriage bore: 'Adam? What's his other name?'

It is really surprising how few eminent Americans are known to the average 'general reader' in England. In America, the names of many of our prominent men must be familiar, in consequence of the frequency and the familiarity with which their actions are discussed in the columns of most of the great newspapers. One is surprised indeed to see English affairs dealt with as if England were only some two or three hundred miles from New York.

Greatness is paid homage to by some people in very peculiar ways. Everybody must remember the story told in connection with Victor Hugo. The great poet was startled one morning by the intrusion of three Englishmen. 'Victor Hugo,' said one, consulting a pocket-book. The poet bowed, thinking that he should be asked for his autograph next. After the visitors had stared for a few seconds, the pocket-book was again consulted. 'Eleven o'clock: the lions!' said the spokesman. Then the party bowed, and walked out of the room.

Truly, the penalties of fame are many, as Emerson doubtless came to the conclusion on at least one memorable occasion. The philosopher was on the way to Philadelphia several years ago, when he fell in with a chatty and agreeable gentleman named Sackett, who told Emerson that he resided in San Francisco. This was all he

said about himself; but from his conversation Emerson judged that his acquaintance was indeed a gentleman of standing and intelligence, and ultimately agreed to dine with Mr Sackett upon their arrival at San Francisco. The next morning Emerson was astounded to find in the local papers the following 'personal' paragraph: 'Professor Ralph Waldo Emerson, the eminent philosopher, scholar, and poet, is in our city as the guest of Mr H. T. Sackett, the well-known proprietor of the Bust Street Dime Museum. Matinées every half-hour: admission, only ten cents. The Double-headed Calf and the Dog-faced Boy this week!' Any one with even a superficial knowledge of Emerson's character will readily understand his feelings at being coupled, as it were, with the monstrosities mentioned.

Scott had several experiences of the penalties of greatness, notably in the case of a female admirer who sent him the manuscript of a tragedy, requesting him to revise it. Imagine Scott's feelings on his discovering that he had to pay five pounds for the postage on this precious packet; and his dismay at receiving, several days later, another copy of the play from the same lady, who, being afraid that the original copy of her tragedy might be lost in transit, had taken the precaution of sending a duplicate, for which Scott had to pay other five pounds.

After pondering over this circumstance, one begins to understand Tennyson's reason for leaving half of his letters unopened. Being 'lionised,' receiving manuscripts from 'budding bards,' and requests for autographs from gushing admirers, certainly form no inconsiderable portion of the 'martyrdom of fame.' Even the notoriety of the comparatively humble village quidnunc is not without many penalties. Soon after he becomes rather too important to be classed among the comprehensive '&c.' with which the reporter of the local paper winds up the list of those present at the laying of foundation stones, annual missionary meetings, and the like, he begins to experience some of the minor penalties arising from local 'fame.' He is expected to contribute to all sorts of objects, from the purchasing of a pavilion for the local Cricket Club to the repairing of the organ in one of the chapels; and if he be a tradesman, he is frequently obliged to give more than he can afford, in order to avoid losing custom, and perhaps to prevent the name of Jones—his rival in business—appearing higher in the list of subscriptions than his own. This is one of the penalties of local notoriety, which is more keenly felt than many suppose.

If the pleasure arising from fame could be accurately gauged, it would be found that unconventional acts of kindness, and simple though sincere compliments, give more pleasure to their recipients than the loudest blare of trumpets or the most eloquent panegyrics. The observation of a well-known writer on receiving a present of a dozen bottles of brandy from an anonymous admirer of his genius is well known. 'This,' he said, 'is true fame.'

Mr W. D. Howells has recently received a flattering proof of the interest taken in his novels, which will more than recompense him for the back-handed compliment of the lady we have already mentioned. When his story, 'Indian Summer,' was being published in *Harper's Magazine*, the

editor received a letter from a lady, who wrote that she was dying, and that her physicians told her she would be dead before the conclusion of Mr Howell's story was published. She was very much interested in it, and did not want to die until she knew how it was going to end, and she begged the editor to let her read the advance sheets, so that she might die happy.

The highest honour that Uhland the Prussian poet received was a very humble gift. The Prussian king, Frederick-William IV., offered him the Order Pour le Mérite, with flattering expressions of the royal regard; but Uhland, who was essentially a poet of the people, declined to accept it. While explaining to his wife the reason which moved him to refuse the distinction, a working-class girl from the neighbourhood entered, and presenting Uhland with a bunch of violets, said: 'This is an offering from my mother!'—'Your mother, child!' replied the poet; 'I thought she died last autumn.'—'That is true, Herr Uhland,' said the girl; 'and I begged you at the time to make a little verse for her grave, and you sent me a beautiful poem. These are the first violets which have bloomed on mother's grave; I have plucked them, and I like to think that she sends them to you with her greetings.' The poet's eyes moistened as he took the posy, and putting it in his button-hole, he said to his wife: 'There, dear woman! is not that an Order more valuable than any king can give?'

Of late years several literary men have been fortunate. Professor Huxley found a cheque for four thousand pounds in one of his morning letters—the bequest of a Bolton admirer. Charles Reade was remembered in the wills of more than one admirer. These generous recognitions of genius are, however, trifling in comparison with the offer of an American millionaire to Martin Tupper, of *Proverbial Philosophy* fame. 'I am one of the richest men in New York,' he said to the author, 'and I know authors must be poor. I like your books, and have told my bankers' [naming them] 'to honour any cheques on me you may like to draw;' and when the offer was declined, the millionaire's house, his yacht, and his carriage were placed at Mr Tupper's disposal. Gifts such as these and unconventional compliments go a long way towards constituting real fame.

THINGS NEW AND OLD.

THE Old, so Wisdom saith, is better than the New.

Friends—like old Wine, old Books, old Days—

With age do ripen into mellow hue;

And Time, for what he takes, full oft repays

True hearts a hundredfold.

So, as the years rush by, old Friend,

May all bright memories of the past revive!

And when the hour is come to say 'Good-night,'

May Peace and Hope be with us to the end,

Up to the fullness of unfading Light!

When by the mystery of Death shall live

Things New and Old.

THE GOLF CRAZE.

REMINISCENCES OF AN OLD HAND.

'If you have a moderate appetite for sand, take your *tee* if you like, but not the tiniest slice of anything with it, remember,' said the soft humorous voice beside me, as I addressed the ball for the first time in the season, with more apparent dexterity, I confess, than inward confidence. It was my second year at golf. I had got over the initial difficulty, it is true; I 'missed the globe' no longer!—Ah, good old friend of those days!—Is it truth, indeed, that Tennyson sings of the yew's fibres netting 'the dreamless head?' Have you no flashes of remembrance of faultless approach or miraculous niblick-shot? For you, too, are under the earth—like the ball you used to send straight home all the way off that marvellous putter of yours—and, alas, for a longer period.

He was one of those men whose eyes have an edge, so to say. They kindled with interest while you spoke, and took in the situation perfectly before you had fully described it. His face was healthily russet, and even in extreme age he looked strong and straight. My intimacy with him dated only from the previous year. He had long worked hard as a medical man in a populous district in the south of England, and his means were considerable in consequence. As the years advanced, however, he longed for that strong sear of the northern portion of our island, which seems to pull a man together in a manner which no artificial pick-me-up, persevered in to the utmost, may pretend to do—outside its advertisements, at all events. Talk on the subject succeeded talk, for a year or two, and nothing meantime came of it; till, on his sixtieth birthday, he told his married son and his unmarried daughter—he had been a widower for ten years—he had finally disposed of his business; that his shrewd investing had largely augmented his savings, and that the coming spring would, please God, see him in some snug retreat in the town of his boyhood, his love and early manhood.

A snug enough place, too, it came to be. One had to enter a wood to reach his house, which stood on the bald crown of an eminence. The strong scent of the sea surrounded and permeated the place. A level lawn in front, with its blackbirds running quickly over it, was a picture of peace. The sea could not be seen at all from the ground flat; but when you had climbed the wide staircase—none of your giddy spirals, but a strong old-fashioned square stair with substantial landings—and had passed into the airy drawing-room, what a view broke upon you! Through the clear air you could view the sea, a couple of miles off, as though it were just at hand, creeping up upon the yellow breast of the shore, where it was delicately fingering a frill of snow—its daily gift. The links lay between you and the sea; and between the links and the sea were sandy knolls, where the blue-green grass grew six—here and there eight—feet high. There lay the dimpled little bit of ground, with its hillocks, its mimic forests of furze, its yawning bunkers, and its mazy burn, where thousands had played the game of all games the most like our larger life, with earnestness, and yet brotherly kindness. Dear sport that it is—made up of continuous striking, without cruelty!

Here, then, lived Dr —, who could never be identified with those loungers who work at nothing and play at everything, for he was diligent and regular in all the details of his life—however dearly he may have loved his round at golf. Early morning found him outside, and off along the upland road on foot or on horseback, to return with appetite to his letters and breakfast. I wish I could paint his own room for you—his 'den,' as he called it; but that is beyond my scope, in this connection at anyrate. I may at least tell you that there lay on the broad serviceable oak table the current number of the *Athenæum*—more frequently in his hands than the *Field*—and a good modern book or two; but in truth, a richly carved old bookcase contained his chief treasures in the shape of well-chosen and well-thumbed classics of the olden time, and, generally speaking, of the

graver sort. Emerson, however, was the Doctor's especial favourite, modern though he be; and while the sweet-tempered Concord mystic never mentions many of the subjects of which my friend loved to speak, I take it that the extraordinary ability the latter displayed in aphoristic utterance had been unconsciously developed by familiarity with the style of the great American. As regards the matter of his discourse, it always appeared to me to be strictly his own.

It is not my intention to speak of his manner of talk in general, although I have often felt sorry that his conversations on higher matters were not caught back out of the invisibility of the air, and fixed in a darker fluid by some accurate reporter. Others have shared this regret with me. Alas! Johnson has his Boswell, Goethe his Eckermann, Coleridge his own kinsman, and Rabbi Duncan his Knight; but this man's talk enriched the atmosphere only, in ways we may not trace; he shot many arrows into the air, but they are not to be found unless we search in the hearts of a few of his friends. But now comes a curious admission. Let him not shrivel down into a lesser man because of it! If you are a golfer, you will not. Nothing in the world would he allow to come between him and his round of the links. One round a day, but one round always, excepting on Sundays. Never was day dark or stormy enough to keep him back; and if he had been favoured, as Mr John Blackwood was, with a letter from George Eliot, in which occurred words like, 'You cannot play golf in the rain,' he would have startled that know-all lady with several aphorisms which would have done no shame, in sense or in construction, to *Romola* itself. He was humane enough, withal, to give his caddie an oilskin suit: he himself wore nothing above his thick tweeds, and never allowed for a moment that he had been one whit the worse in his life for any ducking he had received. He played as near perfection as an elderly amateur may well be expected to do. He had that easy unconscious swing begotten only in youth. The analysis of the subject had never troubled him; he played as children play, and yet he was no 'idiot' ('The ideal golfer is an idiot.'—*Saturday Review*, July 2, 1887), dear old fellow that he was. Wherever you might place him in the wide world, you might depend upon his giving a good account of himself.

He had lived for five years in his seaside home when I was introduced to him. His low-set sweet voice often haunts me; and whenever I find myself on short green grass, with fragrant thymy knolls around me, there I see the authentic background for a loved figure which comes no more.—But let us go on with the round. He had taken in hand to teach a man of great willingness but small ability, and this was the first lesson of the second year. He never played more than his daily round, as has been said. With a fine fortitude, he abstained from even taking his occasional cleek shot alongside my erratic game, contenting himself with giving advice in that wonderfully neat short way of his. His counsel, I hope, has been worked long since into flesh and blood movement—Grip, swing, loft, and putt; but many of his odd little effortless speeches stick well to me in the shape of words, and these I wish to give some idea of. The regular golfing jokes that have

served successive generations, are they not written in the books of Clark, Simpson, and others? It was not these that this man retailed. They multiplied according to the varying exigences of the game, and I never heard him repeat himself. It is said that the occasion makes the man; surely, then, it may well be credited with the minor creative power of making the joke. It did that at anyrate, say what you will. His humour was sometimes so delicate as to defy repetition in any but the precise words which had been used. The story somehow would not tell at times, if the exact inflection of the voice failed in the reproduction. As it is, I can but give the broader fragments of his talk. If I had not heard such multitudes of smart sentences from these lips, I should have considered them carefully coined specially for use beforehand; but to know your man, put such a conclusion at once out of sight.

The ball stood on its tee bright and shining one mid-day in May. The first hole is a short one. Others regarded it, indeed, as a good cleek shot—no more; why shouldn't I? The cleek fell furiously on the ball (a bad one, no doubt, although duly charged for), and, whatever the exact cause may have been, the gutta(?) leapt forward in two parts—neither of which lay dead, it is needless to say. 'Ah,' my adviser said instantly, 'golf is a game of which it may be said that opening the ball ought not to be synonymous with beginning play.'

Here and there pleasing him with my work—for he was generous in criticism ('Never let your spirits run down,' he would say, 'or your score will run up—they are always at seasaw with each other')—I would sometimes drive wildly, and would just catch the murmur of his voice as he said, as it were to himself, 'It is quite undeniable that golf-playing is an art, but *drawing* is altogether out of place there;' or, 'It is as poor an indication of a man's play as of the state of his boots that he goes in for toeing and heeling.'

'Don't you think, Doctor, that, like the poet, the golfer is born—not made?' I asked once, after consecutive fooling?—'Well, probably so—to some extent. I myself venture to believe that when you find the veritable accoucheur, he will tell you plainly that exactly as many men are born with a *short* spoon as a *silver* spoon in their mouths.'
